MORGAN, SIR HENRY, the most distinguished of the men who, under the name of "Buccaneers," made war for England against Spain in the latter part of the 17th century, and did her immense damage. Having amassed great wealth, he settled in the West Indies, and was knighted by Charles II.

MORGANATIC MARRIAGE, a marriage once fairly common among the princes of the numerous royal and princely families of Germany, when they desired to wed one beneath them in rank. The marriage was accounted legal, and the children legitimate, but the wife did not share her husband's title nor the children his rank.

MORGARTEN, a mountain in Switzerland, where a few hundred Swiss patriots routed an Austrian army ten times as numerous, creating a panic by rushing down on them from the heights, 1315.

MORGUE, THE, a building at the back of Notre Dame, in Paris, where the bodies of unknown persons found dead are exposed to view, that they may be claimed by their friends. There are Morgues in many American cities.

MORIAH, MOUNT, the hill on which Solomon's Temple was built; sometimes said to be the hill on which Abraham sacrificed Isaac.

MORLAND, GEORGE, *b.* 1763, *d.* 1804, a painter of homely rustic scenes, was an unfortunate example of the power of low habits to keep a man from attaining his best. His life was one long alternation of drink and work. Many of his pictures are much admired.

MORLEY, JOHN, *b.* at Blackburn, 1838; was educated at Oxford, and adopted a literary career. But his interest in political questions proved too strong for his literary leanings. In 1883 he entered Parliament, and in 1886 became Secretary for Ireland. He is an ardent Home Ruler, and was Gladstone's chief lieutenant in his attempted Home Rule legislation. In 1905 he became Secretary for India. His "Life of Gladstone" and similar works entitle him to a very high place as a biographer.

MORMON, THE BOOK OF, a book said to have been found by Joseph Smith, the founder of the Mormons, or "Latter-day Saints," as they call themselves. It professes to be an account of America from the time of the Tower of Babel.

MORMONS, THE, a religious body founded by one Joseph Smith, who claimed to have a direct mission from God to prepare for Christ's second coming. Smith was the son of a farmer in the State of New York, and gave out, in 1820, when he was fifteen, that he had seen God in a vision. Other visions were said to have followed, and in 1827 he was directed to find the writings, which he afterwards published as the "Book of Mormon." In a few years his church was established, and after many vicissitudes it settled in Utah. Polygamy is an important feature of the Mormon religion. Brigham Young, the President who succeeded Smith, came on a mission to England, and made many converts, who went to join the church in America.

MOROCCO, a country, or rather tract of land in the north of Africa, stretching from about 2° to 13° W. Longitude. It has not yet been thoroughly surveyed, nor even entirely explored. It stretches back from the coast into the Sahara, and has a population estimated as low as three millions, and as high as thirteen millions. There exists a Sultan, but he has little authority. Among the tribes of the interior he has none; but in the more settled coast provinces he is obeyed when he chooses to enforce obedience. Total trade about £3,000,000 per annum, of which Great Britain has half.

MORPHOL'OGY, the study of form and structure, as distinguished from the study of function. Thus the fact that the human heart has four chambers comes under the cognisance of morphology, while the fact that it pumps the blood through the body belongs to physiology proper.

MORRIS-DANCE, or "Moorish Dance," an outdoor dance, formerly much in vogue at the May-day revels and other festive occasions. The name is derived from the Moors, from whom it was learnt by the English when at war in Spain.

MORRIS, SIR LEWIS, *b.* in Carmarthenshire, 1833, poet, educationist, and barrister; was educated at Sherborne and Oxford. He wrote little poetry till after 1870, but he soon gained a hearing. "Songs of Two Worlds" and "The Epic of Hades" are his most important works.

MORRIS, WILLIAM, *b.* 1834, *d.* 1896, poet and idealist; was educated at Marlborough and Oxford. He founded a business which led the way in the improvement of internal decoration in every form. His Socialist leanings made him decline the office of Poet Laureate. "The Life and Death of Jason" and "The Earthly Paradise" are two of his greatest works.

MORSE, SAMUEL, *b.* 1791, *d.* 1872; the American inventor who claimed to have preceded our Wheatstone in inventing the Electric Telegraph. The Morse, or dot and dash system, is now almost universally used.

MORTAR, a short cannon with a wide barrel and mouth, used for firing shells high up into the air, so that they fall almost vertically on the object. Their aim is not very accurate, unless they are rifled.

MORTARA, EDGAR, a Jewish boy of Bologna, who was baptized by his parents' maidservant and then delivered into the hands of the Roman Catholic church. His parents vainly tried to recover him, although the Pope was appealed to. When grown up he became a monk, refusing to return to the Jewish faith.

MORTE D'ARTHUR. (1) A romance of King Arthur, compiled by Sir Thomas Malory, and first printed by Caxton in 1485. It gives all the chief Arthurian legends. (2) A poem by the late Lord Tennyson, forming one of his "Idylls of the King."

MORTIMER, ROGER, the paramour of Queen Isabella, wife of Edward II. They raised an army against Edward, and forced him to resign the crown. When Edward III. came of age and assumed power, he had Mortimer executed, 1330.

MORTIMER'S CROSS, in Herefordshire, was the scene of a battle in which Edward of York, afterwards Edward IV., routed the Lancastrians in 1461.

MOSA'ICS, small pieces of marble, stone, or coloured glass set together on a surface so as to produce a pattern or

artistic design. It was a favourite decoration among the Greeks and Romans.

MOSCOW, on the Moskva, almost in the centre of Russia, is the second city of that Empire, and until the time of Peter the Great was the capital. The Kremlin (Citadel), is the most sacred spot in the country to a Russian. The city was burnt down in 1812 by the inhabitants to dislodge the French; population about 1,000,000.

MOSELLE, a river which, rising in France and flowing north-east into Germany, joins the Rhine at Coblenz, after a course of 360 miles. It passes the formidable fortress of Metz.

MOSES, the great liberator of the Israelites from Egypt, their great lawgiver under God, and leader through the perils and hardships of the wilderness, between Egypt and Canaan. He died on Mount Nebo on the borders of Canaan.

MOSHEIM, JOHANN VON, *b.* 1694, *d.* 1755, an eminent German writer on theology and church history. His works have been translated into English and other languages.

MOSKVA, a river 300 miles long, in Russia, on which stands Moscow. It is a tributary of the Oka, and is usually frozen over from November to April.

MOSLEMS, a name by which Europeans in general designate all Mohammedans. It is our form of the Arabic word "muslim" (a true believer).

MOSQUE, a Mohammedan place of worship. The Mosque of St. Sophia at Constantinople is the finest in the world, whilst those of Jerusalem and Cairo are not much inferior.

MOSQUITO, a name given to various species of gnats, whose bite is very painful. It has lately been proved beyond doubt that the parasite which causes malarial fever is conveyed by the bite of the anopheles mosquito.

MOSS, the popular name for several kinds of small flowerless plants flourishing in damp places. In mountainous and wet districts tracts of moss are of great service in retaining the water and preventing sudden floods.

MOSS-TROOPERS, a name given to the thieves who, previous to the Union between England and Scotland, lived by plundering the border lands of the two countries. They had their retreats among the numerous mosses or bogs of the Borders.

MOSUL, a decayed town on the Tigris, opposite the ruins of Nineveh. The fabric muslin takes its name from this town, which, in the Middle Ages, was a considerable mart for the cotton stuffs manufactured in the neighbourhood; population about 30,000.

MOTHER CAREY'S CHICKENS, a name given by sailors to the Stormy Petrel and other small sea-birds which are very often seen before and during stormy weather.

MOTHER OF PEARL. See *Pearl.*

MOTIF, in music, is the principal theme of a musical composition. As the piece proceeds, it is heard again and again on one or other of the instruments, either entire or in part. A long composition may have one or more subordinate motifs.

MOTLEY, JOHN LOTHROP, *b.* 1814, *d.* 1877; will ever be known as the author of the "Rise of the Dutch Republic," and other works dealing with the history of the Low Countries. He was an American, and did good service to his country as minister at Vienna, and later on in London.

MOTOR CARS AND MOTOR CYCLES. See *Automobiles.*

MOTTO, a short sentence accompanying a crest or other heraldic device. It consists usually of a pious sentiment, as "Deo fidelis et regi," (faithful to God and king), or a sentence expressing the policy or principle of the bearer, as "Festina lente," (Hasten slowly).

MOULD, a name given to the growth which appears on decaying organic substances. The "mould" is really a fungus, and its appearance and nature depend on the substance it derives its life from.

MOUND BIRDS, a kind of bird about the size of our domestic fowl, found in Australasia and the East Indies. They build mounds of earth and leaves to hatch their eggs in, and add to them year after year till they are of immense size.

MOUNT-STEPHEN, (George Stephen), **LORD,** *b.* in Scotland, 1829; Canadian banker, railway director, and philanthropist; emigrated to Canada in 1850. A successful banker at Montreal, he turned his attention to railways, and the Canadian Pacific Railway owes its existence largely to him. His peerage is a recognition of his public services and his charitable gifts. (See *Strathcona.*)

MOUNT VERNON, the home and burial place of George Washington, is in Virginia, 15 miles from Washington. The mansion and grounds surrounding it were bought and presented to the nation in 1856.

MOUSE TOWER, a tower situate on a little island in the Rhine, near Bingen. Legend says that Hatto, Archbishop of Mainz, was here devoured by mice because he withheld corn from the poor in a time of scarcity.

MOUSQUETAIRES, musketeers, the old mounted bodyguard of the French kings, all of noble descent and mounted on grey or black horses, according to their company. Formed by Louis XIII., they existed till 1791. Dumas' "Three Musketeers" gives a fair idea of their mode of life.

MOZAMBIQUE CHANNEL, between Madagascar and the east coast of Africa, is about 1000 miles long and 400 wide. Beira, the port for Mashonaland, is near its southern end.

MOZART, WOLFGANG, *b.* 1756, *d.* 1791; an illustrious composer, son of the chapel-master of Salzburg, Austria. His genius was early displayed, for at the age of six he made a musical tour of Europe. At the age of fourteen he composed his first opera, "Mithridates," which was well received. In 1781 he went to Vienna, and soon entered the service of the Emperor Joseph, who requited him neither with fair words nor gold. His wife could do everything but manage a household, so they were always in trouble. A mysterious visit from an unknown person, commissioning him to write a Requiem Mass, made a deep impression on him, and its repetition some months after convinced him of its supernatural nature. Soon after this second visit he drooped and died. He was buried in the common ground of St. Mark's Churchyard, without a single friend to see the last of him, and no one can say where he lies. "Don Giovanni," "The Magic Flute," and the "Marriage of Figaro" are his best operas. His other musical works are numerous.

MUD VOLCANOES, small conical hillocks in volcanic regions, from a few feet to a hundred yards in height, from the centre of which mud is more or less constantly flowing, urged by gas pressure below. Sometimes they sink into entire repose, then again burst into violent eruption. They are found in Iceland, Sicily, and elsewhere.

MUDIE, CHARLES EDWARD, *b.* 1818, founder of the celebrated "Mudie's Library," set up in Southampton Row as a publisher and bookseller in 1840. In 1842 he inaugurated his lending library, and met with immediate success. He set a high standard in selecting his books, but was lavish in his purchase of those he did select, taking thousands of copies at once of promising new works.

MUEZZIN, an official belonging to a Mohammedan mosque, whose duty it is to proclaim the hour of prayer from the minaret of the mosque. This he does five times a day: at dawn, noon, 4 p.m., sunset, and nightfall.

MUFTI, a judge, or priest, or interpreter of the law among Mohammedans. Each locality has its mufti, who is both judge and director of religion. The "Grand Mufti" is the head of the Ulema (which see). The word "mufti" is used in the army to denote private dress.

MUGWUMPS, those who vote against their party in what they believe to be the interest of their country. The term was first applied in the States to those Republicans who voted for Cleveland, the Democratic candidate, in 1884.

MUKDEN, the capital of Manchuria, is surrounded with walls 60 feet high with eight noble gateways. It stands in a commanding position for trade, about 120 miles inland from Newchwang, its port; population about 250,000. It was from Mukden that the Manchu princes descended upon Pekin, about 1640, and founded the dynasty which still bears rule in China.

MULBERRY, a tree indigenous to the middle of Asia, but introduced into Europe about 1000 years ago. Its succulent fruit is only in its prime for a very short time. The Black Mulberry gives the best fruit, while the leaves of the White Mulberry are found suitable for rearing silkworms.

MULE, the offspring of the ass and the mare, is a most useful animal much employed in mountainous countries on account of its sure-footedness and endurance.

MULLAH, or **MOLLAH,** the head of a religious society in Mohammedan countries, or the founder of a sect or movement having religion as its nominal basis. In India and Africa, so-called religious wars against the "Infidel" (headed by "Mad Mullahs") have often given the English trouble.

MÜLLER, FRIEDRICH MAXIMILIAN, *b.* 1823, *d.* 1900; the great philologist, was born and educated in Germany. Coming to England in 1846 to study Oriental manuscripts, he was prevailed upon to make his home here. He was made Professor of Modern Languages at Oxford, and there he published the works on ancient and modern languages which have made his name famous.

MÜLLER, GEORGE, *b.* 1805, *d.* 1898, was a German who came early to England and settled down as minister of a chapel at Teignmouth, Devon. He had an aversion to asking for money. When he founded his well-known Orphan Homes at Bristol, in 1836, he made no public appeal for assistance, relying on prayer. His trust proved always well-founded, although he was at times on the brink of destitution. What a vast work he accomplished may be judged from the fact that in 1875 his Homes contained 2,000 children, and that they continued to flourish until his death. In fact, during his life, 11,400 orphans passed through his homes at an expenditure of £1,120,000.

MULLET, a fish found in most temperate and sub-tropical latitudes, varying in weight from one to ten or twelve pounds. The Red Mullet is chiefly found in the Mediterranean Sea; the Grey and Striped Mullet are common round our coasts. The mullet has a high value as a food.

MULREADY, WILLIAM, *b.* 1786, *d.* 1863; one of our great painters, was

born at Ennis, in Ireland. Incidents of every day life, such as "Horses Baiting" and "The Barber's Shop," were most to his liking, and in depicting these he is almost unequalled.

MULTAN, or **MOOLTAN,** an ancient city of India near the banks of the Chenab. It is the centre of trade for the Punjab, collecting agricultural produce, and sending it down to Haidarabad and Karachi. It has also great trade with Afghanistan; population about 80,000.

MUMBO-JUMBO, a bogie with which negroes in Africa terrify women and children; hence, an object of unreasoning fear.

MUMMY. See *Embalming.*

MÜNCHAUSEN, BARON VON, a German nobleman and soldier who used to tell marvellous stories of his adventures. A fellow-countryman published a selection of these, with additions of his own, under the Baron's name, which proved very popular.

MUNICH, (München), on the Isar, a tributary of the Danube, is the capital of Bavaria, and third greatest town in Germany. In 1800 its population was about 50,000; it is now 520,000. Its collection of paintings, sculpture, and other art treasures is of great value.

MUNICIPALITY, a town or borough whose citizens possess certain rights of self-government.

MUNKACSY, MICHAEL VON, *b.* 1844, *d.* 1900; a Hungarian painter of striking historical and sacred subjects, lived his last years in Paris, and there did his chief work. "Christ before Pilate" and "Golgotha" are perhaps his best paintings.

MUNSTER, the largest of Ireland's four provinces, occupies the south-west of the country. It contains the busy town of Cork; the picturesque bays, called Dingle, Kenmare, and Bantry Bays; the lovely lakes of Killarney; and the mouth of the Shannon, with the historic town of Limerick. Its population is a little over a million, almost all Roman Catholics of pure Irish origin.

MURAL CIRCLE, an astronomical instrument once used in large observatories. It consisted of a circle of metal revolving on an axis projecting from a wall, whence its name. Attached to the circle was a telescope for observing the meridian passage of stars.

MURAT, JOACHIM, *b.* 1771, *d.* 1815, was the son of an inn-keeper, but in the Napoleonic wars distinguished himself as a cavalry commander, and became a French Marshal. He married a sister of Napoleon, and became by his favour king of Naples. In 1814 he tried to attach himself to the allies, but Britain refused to acknowledge him as king. After the escape from Elba he declared for Napoleon, but was defeated, and later on was shot on attempting to assert his sovereignty.

MURATORIAN FRAGMENT, a catalogue of New Testament Scriptures, probably drawn up by Hippolytus about A.D. 230. The manuscript was discovered by an Italian historian named Muratori, and published by him in 1740.

MURCHISON, SIR RODERICK IMPEY, *b.* in Rosshire 1792, *d.* 1871; was one of the great scientists of the 19th century. He served till 1816 as an officer in the army. Then geology claimed him, and his reputation soon became world-wide. The Emperor Nicholas engaged him to make a geological survey of Russia, and he was repeatedly elected President of the Geological and Geographical Societies.

MURDOCH, WILLIAM, *b.* in Ayrshire. 1754, *d.* 1839; the inventor of coal gas as an illuminant, and of numerous improvements in machinery; worked for some years in Cornwall superintending the construction of mining machinery. He lit his house at Redruth with coal gas, and afterwards lit Messrs. Boulton and Watt's, Soho foundry, in the same way.

MURILLO, BARTOLOME, *b.* 1618, *d.* 1682; the most celebrated of Spanish painters, devoted himself almost entirely to sacred subjects. Seville, his native town, possesses many of his works. His many "Madonnas" and his well-known pictures of the "Immaculate Conception" are his best works.

MURRAIN, a term formerly applied to a contagious and fatal disease attacking cattle, now known as *Rinderpest.*

MURRAY, DR. JAMES AUGUSTUS, *b.* in Roxburghshire, 1837, was assistant master for some years at Mill Hill School. His works on Philology and Antiquities marked him out as editor of the great new English dictionary now in progress, and he moved to Oxford to devote himself to his great task.

MURRAY, LINDLEY, *b.* 1745, *d.* 1826, an American grammarian and writer of school books, settled in England in 1784. His grammar was published in 1795, and for over fifty years was practically the only book on the subject used in England and America.

MURRAY, THE, the only important river in Australia, rises in the Australian Alps, near the east coast, and flows westward for 1300 miles to reach the sea in Encounter Bay. It is of little use for navigation, as, owing to the uncertain rains, its volume is very variable, and from Lake Alexandrina it makes its way to the sea by many shallow channels of shifting sand.

MÜRREN, a tourist resort in the Bernese Oberland, Switzerland, overlooking the Lauterbrünnen valley, with the Jungfrau and the other giants of the Oberland in full view.

MUSCAT, capital of Oman or Muscat, a small state in the east of Arabia, commanding the entrance to the Persian Gulf. It is a centre of trade between Arabia, Persia, India, and East Africa; population about 20,000.

MUSCATEL, the name of a very rich and sweet grape grown in France and Italy, and of the wine made from it. The grapes are also dried for table raisins.

MUSCOVY, an ancient name of Russia, derived from Moscow, the former capital.

MUSES, THE, in Greek mythology, the deities presiding over and cherishing various arts. They were nine in number, Clio, the muse of history; Euterpe, of lyric poetry; Thalia, of comedy; Melpomene, of tragedy; Terpsichore, of dancing; Erato, of love songs; Polyhymnia, of singing and harmony; Urania, of astronomy; and Calliope, of epic poetry. Mount Helicon in Bœotia, and Mount Parnassus, 80 miles north-west of Athens, were said to be their favourite haunts, whence poetry is often said to flow from Helicon's springs, and the road to learning is called the ascent of Parnassus.

MUSK DEER, a species of hornless deer with upper canine teeth projecting as tusks, widely distributed in Asia, and much sought for on account of the musk it yields. The latter is found in a pouch or bag at the back of the abdomen, and is one of the most pungent, powerful, and permanent of perfumes.

MUSKETRY, SCHOOL OF, at Hythe; was founded in 1853 for the training of officers and sergeants in the theory and practice of musketry, so that they might act as "musketry instructors" on returning to their regiments.

MUSK-OX, a small animal resembling both the ox and the sheep, and between them in size, found in the north of the Dominion of Canada. Its flesh has an odour of musk, but none is obtained from it.

MUSSULMANS, a corruption from Muslimin, the plural of muslim (moslem), "a true believer."

MUSTANG, the wild horse of America, the descendant of the original stock introduced by the Spanish conquerors.

MUSTARD, a condiment formed of the ground seeds of three plants grown in temperate and warm climates, called respectively white, black, and wild mustard. The latter is better known as Charlock.

MUTINY ACT, an act formerly passed annually, authorising the sovereign to enact rules for the government of the army. Without it a soldier would be subject to arrest and punishment, only under the same conditions as a private citizen, and discipline would be impossible. The same power is now conferred by the Army Annual Act, which also applies to marines on shore.

MYCE'NÆ, an ancient Greek city in the Peloponnesus, six miles north of Argos. In the time of the Trojan War it was the chief city of Greece. Agamemnon was its king. The study of Mycenæan remains has shed much light on the history of civilization and the arts.

MYRMIDONS, in Greek legend, the name of a people who lived in the south of Thessaly. Achilles was their king, and they followed him to Troy. Hence the devoted followers of any adventurous leader are often called "myrmidons."

MYRRH, gum or resin which exudes from a kind of myrtle that grows in Arabia and East Africa. It is highly aromatic, has a bitter taste, and is a very valuable tonic and stimulant.

MYSORE, a table-land in the south of India, about two-thirds the size of Scotland, forming a native state under British Protection. The gold-mines of Kolar, in the east of Mysore, have lately assumed importance, and are now turning out about £2,000,000 worth a year. Hyder Ali and his son Tippoo Sahib, sultans of Mysore, gained several successes in war with the British in the course of the latter half of the 18th century. Both, however, were ultimately defeated, Tippoo being slain at Seringapatam, and Mysore annexed.

MYTHOLOGY, a collection of fables and traditions referring to the forces of Nature, to national heroes, and to the gods. The nature-myths are primitive attempts to explain the processes of nature, and may be looked upon as the beginnings of natural science. The hero-myths are akin to sacred mythology. In India, *nature*-myths reached a high state of development; whilst in Greece, *personal* mythology flourished because it provided a better field for the artistic and dramatic temperament of the Greeks.

NAAMAN, the Syrian warrior and courtier who came to Elisha the prophet to get cured of his leprosy. The forgiveness assured him for bowing down in the House of Rimmon has often been quoted to support actions of a dubious character.

NABOB, (in Hindoo, "nawab"), a deputy or governor of a province or district under the Mogul emperors. From the lavishness and ostentation of many of the officials of the old East India Company, on their return home they were often contemptuously termed "Nabobs."

NABOPOLASSAR, father of Nebuchadnezzar, king of Babylon, was viceroy of Babylon under the Assyrians till about 620 B.C., when he revolted and made himself independent.

NABOTH, the native of Jezreel, whose vineyard was coveted by King Ahab. The story of how Ahab had Naboth done to death on false accusations has passed into a proverbial expression for the exercise of might over right.

NACRE, same as *Mother-of-Pearl.*

NAGASAKI, the western seaport of Japan, was long the only place where foreigners were allowed to resort, and until 1859, only Dutch were admitted. In that year it and four other ports were thrown open to British and Americans, and before long Japan removed all restrictions on entry. The total trade of Nagasaki amounts to over £1,000,000. It exports much coal; population exceeds 100,000.

NAIADS. In Greek mythology, deities of inferior order, called nymphs, inhabited various places on the earth. Of these, the Naiads were the nymphs inhabiting fountains, springs, and brooks.

NAKHON WÁT, a temple near Nakhon or Angkor, the ancient capital of Cambodia, the finest specimen extant of Cambodian architecture. It dates from the 13th century.

NANAIMO, a prosperous little town on the east side of Vancouver Island, connected by rail with Victoria, 74 miles to the south-east. Near Nanaimo are large mines of good coal.

NANA SAHIB, the son of a Brahmin, was adopted by the Peishwa of the Mahrattas, who had made peace with the English, and received a pension from them. When the Peishwa died, the pension was not continued to Nana, and he conceived a bitter hatred for the English. On the outbreak of the Mutiny in 1857 he besieged the English in Cawnpore, who surrendered on a promise of safe conduct, but all the men except four were massacred as they started down the river to Allahabad, and the women and children still more cruelly killed just before the capture of the town by General Havelock. The fate of Nana, who escaped capture, is not known.

NANCY, a town in the north-east of France, the ancient capital of Lorraine, has many beautiful buildings dating from the 16th century and earlier. It has grown much since 1871 owing to the large number of people settling there from the provinces then ceded to Germany. It has various manufactures, of which cambric and muslin are the chief; population about 100,000.

NANKEEN, a kind of buff coloured cotton stuff, originally manufactured at Nanking, in China. It is now largely manufactured in England and exported to China.

NANKING, a large town of China, formerly the capital, on the Yang-tse-Kiang, about 130 miles from its mouth. Here was signed the treaty of 1842, by which Hong Kong was ceded to Britain, and five Chinese ports were opened to foreign trade; population 150,000.

NANSEN, DR. FRIDTJOF, was born near Christiania in 1861. He made zoology his study, and undertook several voyages to the Polar Regions for the purpose of observation. He came to the conclusion that a current from Asia to America must pass pretty near the North Pole, and that a ship drifting with it should get near that desired spot. In 1892, in the *Fram*, he had an opportunity of testing his theory. His ship drifted within 6° of the Pole, and Nansen himself, with Johansen, got with the aid of sledges to lat. 86° 14′, or within 250 miles of the Pole, 200 miles nearer than any one before.

NANTES, population 128,000, an important town of France, near the mouth of the Loire, has been almost entirely rebuilt within the last half century. It is a thriving port and manufacturing town. Here Henry IV. of France signed the famous Edict of Nantes, giving religious freedom to the Huguenots (1598).

NAOMI, wife of an Israelite who left Canaan in the days of the Judges to avoid famine. In the land of Moab Naomi was eventually left with a daughter-in-law, Ruth, whose story is told in the Book of Ruth.

NAPIER, ADMIRAL SIR CHARLES, *b.* near Falkirk, 1786, *d.* 1860; a distinguished naval commander, who rendered England good service through the Napoleonic wars, and afterwards in various expeditions. He was in command of the Baltic Fleet during the Crimean War, and was censured for not accomplishing any great exploit, but cleared himself completely. He did much, both officially and as an M.P., to improve the navy.

NAPIER, GENERAL SIR CHARLES JAMES, *b.* in London, 1782, *d.* 1853; cousin of the above, was a lieutenant in the army before he was thirteen. He served with distinction in the Peninsular War. His fame was won in India, where, in 1843, he gained against fearful odds the battles of Meeanee and Hyderabad, and made the English masters of Sind. He is said to have announced this event by the brief dispatch, *peccavi*, a Latin word meaning, *I have sinned* (Sind). He was afterwards made Commander-in-chief of the army in India.

NAPIER, JOHN, *b.* at Edinburgh, 1550, *d.* 1617; one of the most eminent mathematicians of all time, was a Scotch laird, whose seat was at Merchiston, near Edinburgh. His fame rests on the system of logarithms which we owe to him, by which the operations of division and multiplication, and of involution and evolution, are much shortened and simplified. He had many distinguished descendants.

NAPIER, ROBERT, LORD NAPIER OF MAGDALA, *b.* in Ceylon, 1810, *d.* 1890; entered the Indian army at the age of 18, and until he was nearly sixty years of age was hardly ever out of India. He did good service in the Sikh War, and in the Mutiny, and took part in the China expedition of 1860. His striking power of organisation was shown in the Abyssinian War of 1860, a war in which natural obstacles were more formidable than the enemy's troops. From 1870 to 1876 he was Commander-in-chief in India.

NAPIER, SIR WILLIAM, *b.* 1785, *d.* 1860, brother of Sir Charles James Napier, and cousin of Sir Charles Napier; distinguished himself in the Peninsular War, gaining seven decorations for his gallantry in the field. But he chiefly claims attention as a writer, his "History of the Peninsular War" ranking as a classic. His "Conquest of Scinde" and minor writings also show his mastery of details and graphic power.

NAPLES, on the bay of that name, 117 miles south-east of Rome, was founded by a colony of Greeks long before historical records begin. Under the Empire, it was a favourite seaside resort for the wealthy Romans. Its lovely situation and health-giving powers are now reinforced by the sanitary improvements long needed. The trade of Naples amounts, imports and exports together, to about seven millions per annum; population exceeds 560,000.

NAPOLEON, EUGENE LOUIS, *b.* 1856, *d.* 1879. The Prince Imperial, as he is often called, was son of Napoleon III., and on the latter's fall escaped to England. He studied at the Woolwich Academy, and in 1879 went to serve as a volunteer against the Zulus. He was slain in an ambush laid by the latter.

NAPOLEON I., EMPEROR OF THE FRENCH, *b.* 1769, *d.* 1821; a native of Ajaccio, in Corsica, first distinguished himself by defending Toulon against the English in 1793. In 1796 he was appointed to command the army of Italy, and all through this year, and into 1797, he gained renown by the masterly way in which he out-manœuvred the Austrians, his opponents, and gradually made himself master of the kingdom. The Treaty of Campo-Formio left France free from fear as far as Austria was concerned, and the Expedition to Egypt, as a step towards the conquest of India, was his next great move (1798). The destruction of his fleet in Aboukir Bay, by Nelson, convinced Bonaparte that he could not become master of the East while Britain "ruled the waves." His next aim, therefore, was to destroy Britain's sea-power. He returned to France, overthrew the Directory and got himself declared First Consul of the Republic (December, 1799), his two colleagues in the consulate being mere puppets in his hands.

The next seven years are the most splendid in the life of this brilliant adventurer. By his victory at Marengo, in 1800, and that of Moreau at Hohenlinden, French domination was restored in Italy. The treaties he made with the leading powers, in 1801 and 1802, left France mistress of the Continent, and for some time he devoted himself to those civil reforms in France which have made her, in some ways, an example to civilization. He declared himself Emperor in 1804, and in 1805 he hoped to effect his long planned invasion of England. Nelson's victory at Trafalgar diverted the scourge of war from England to Prussia, Austria, and Russia. The victories of Austerlitz, Jena, Auerstadt, Eylau, and Friedland, caused his Continental enemies to acknowledge his genius and fear his hostility. By the middle of 1807 he was practically master of the Continent, and then his evil genius caused him to turn his eyes on Spain.

The story of how England ruined his plans there gave the Continental powers renewed courage. The disastrous invasion of Russia, in 1812, broke the heart of his army, and though he still gained victories, his enemies were too numerous to be crushed. Through 1813 he kept his foes at bay, but the beginning of 1814 saw them marching on Paris from the north, while Wellington was preparing to do the same from the south. His abdication, retirement to Elba, return, the "Hundred Days," Waterloo, his second abdication, his enforced retirement to St. Helena; all these seem to have happened with the speed of enchantment. In 1821 he died, and his remains were brought to Paris in 1840.

NAPOLEON II., DUKE OF REICHSTADT, *b.* 1811, *d.* 1832, was the only son of Napoleon by Maria Louisa of Austria. After the fall of Napoleon, he remained in the care of his grandfather, Francis I. of Austria, till his death.

NAPOLEON III., *b.* 1808, *d.* 1873, was nephew to the great Napoleon. Educated in Switzerland and Germany, the death of his cousin, Napoleon II., directed his mind to France, and the possibilities awaiting him there. In 1836 he made a foolish attempt to gain the army over, but was detected and allowed to go into exile. Soon after he made England his home. In 1840 he made another fruitless attempt on the French throne, which resulted in his imprisonment in the fortress of Ham. The revolution of 1848 proved his chance. Returning to France as a simple citizen, he got elected as deputy to the Assembly, and soon a plebiscite made him President of the Republic. He took the oath of

allegiance to the republic, and kept it for nearly two years. In December, 1851, he got himself elected President for ten years, and a year later, by his favourite method of the plebiscite, was made Emperor. His share in the Crimean War as an ally of England, strengthened his position, but the unfortunate war with Germany, 1870–71, brought his reign to an end. In March, 1871, he came to England, and lived at Chiselhurst till his death.

NARCISSUS, in Greek mythology, a beautiful youth, was insensible to love, and the nymph Echo, who vainly loved him, died of grief. Nemesis, to punish him, caused him to fall in love with his own image reflected in a fountain, whereupon he gradually pined away and was changed into the flower that bears his name.

NARES, SIR GEORGE STRONG, Vice-Admiral and Arctic explorer, was born in 1831, and early entered the Royal Navy. He took a leading part in the Arctic Expedition of 1852–54. He was placed in command of the Challenger expedition in 1872, but was called away to command the *Alert* in the Arctic expedition of 1875, when he reached a higher latitude with his ship than any one ever had before. Besides recording his explorations, he has also written some standard works on naval affairs.

NARWHAL, a genus of whale, the male of which is provided with a long spiral tusk, which may attain a length of 8 or 10 feet, while the animal itself hardly ever exceeds 16. It is hunted both for its oil and ivory.

NASEBY, a village in Northamptonshire, near which was fought, in 1645, the battle which practically brought the Civil War to an end.

NASH, JOHN, *b.* 1752, *d.* 1835; a celebrated London architect, planned Regent's Park, and designed the handsome terraces surrounding it. Regent Street, Waterloo Place, Buckingham Palace, and many other West End buildings are his, besides many country mansions.

NASH, RICHARD ("Beau Nash"), living in a state of society which we are incapable of realising, was for some years the autocrat of Bath. Born in 1674, and educated for the law, he came to London, and became a man of fashion. In 1704 he was made master of the ceremonies at Bath, and for fifteen years he ruled the people of fashion who thronged that city. Later his sway declined, and he died in comparative poverty.

NASMYTH, JAMES, *b.* at Edinburgh, 1808, *d.* 1890, was the inventor of the steam-hammer, and many other engineering appliances. Mechanics was evidently his bent, and he early got employment at Maudsley's, then the leading engineers, whence he migrated to Manchester to set up for himself. In a few years, by his inventiveness and application, he made a fortune, and retired.

NASSAU, HOUSE OF. The family of Nassau dates from the tenth century. They ruled Nassau, now Wiesbaden, in Germany, until 1866, when the reigning duke sided with Austria in her conflict with Prussia, and his duchy was annexed by Prussia in consequence. A younger branch obtained by marriage the principality of Orange, in the south of France, and from them our own William of Orange (William III.) was descended.

NATAL. Refer to *Index*.

NATIONAL ANTHEMS. The English National Anthem is now undoubtedly "God save the King," though "Rule Britannia" ran it close for a long while. The "Marseillaise," the French National Anthem, was composed in the early days of the Revolution, and is of an exciting character worthy of its origin. The Russian National Hymn, "God the All-terrible," is a grand composition, while the "Watch on the Rhine," the German National Air, and the Austrian National Hymn, are very effective. "The Wearing o' the Green," and "Scots Wha Hae," delight Irish and Scots respectively.

NATIONAL COVENANT, a declaration and oath taken by Scotsmen, by which the subscribers bound themselves to maintain the Presbyterian religion. It was first drawn up in 1580, but the most celebrated occasion of its administration was in 1638, in resistance to Charles's attempt to force Episcopacy and a Liturgy on Scotland.

NATIONAL DEBT, an arrangement by which money lent to the Government is not bound to be paid back, but interest on it is guaranteed in perpetuity. The English National Debt dates from the days of William III., who found this a ready way of paying for his wars, which cost £16,000 000. Marlborough's campaigns cost £38,000,000 more, and so it went on till in 1816 the national debt amounted to £900,000,000. By 1899 this had been brought down to 635 millions, but the Boer War added 150 millions, so the debt now stands near 800 millions.

NATIONAL PORTRAIT GALLERY, a collection founded in 1856, and now housed in St. Martin's Place, of portraits of the most notable people in British history, in literature, art, or science. It also contains some interesting medals, autographs, etc.

NATIONAL GALLERY, the chief building for the reception of pictures belonging to the nation, is on the north side of Trafalgar Square, London. The collection was commenced in 1824 by the purchase of the Angerstein collection of pictures, and the present building was finished in 1838. Some of the pictures have been presented or bequeathed by private individuals, and others bought, so that the total number amounts to nearly 1400, representing all the great "Schools."

NATIONAL RIFLE ASSOCIATION, an association founded in 1860 to promote the practice of rifle shooting. Lord Elcho was the prime mover in the movement, and Queen Victoria warmly supported it. The annual prize meetings, once held on Wimbledon Common, now are held at Bisley.

NATIONAL SERVICE LEAGUE, an association founded in 1902 to promote legislation securing compulsory military training for all males within certain ages capable of bearing arms. Lord Raglan is the president, and the members are of both political parties.

NATURALISATION is the form or process a person has to go through in order to obtain the rights of a native in a land not his own. The conditions vary in different countries, but in Great Britain a certificate of naturalization may be obtained after five years' residence, the fees amounting to £6.

NATURAL SELECTION, a convenient phrase to express the theory that of two given individuals of the same species, the one possessing qualities or characteristics of any kind in excess of the other, that enable it either to obtain food more easily, or to escape its enemies more surely, will be the one to survive, and to transmit its qualities and characteristics to posterity. This is what is meant by "the survival of the fittest."

NATURAL THEOLOGY is the science that treats of the existence, nature, and character of the Creator based on the study of Nature, and the ends it is apparently designed to serve.

NAUTCH GIRLS, native Indian dancing girls. Dressed in bright coloured robes and wearing gold and silver bells around their ankles, they dance to the strains of voluptuous music.

NAUTILUS. The Nautilus so often referred to by poets is really not a nautilus at all. Its proper name is *Argonaut*, a mollusc chiefly found in tropical seas. Only the female ever possesses a shell, and even she does not raise her arms to catch the wind. The so-called sails are reproductive expansions on two of the tentacles. The nautilus proper is a shell-fish which haunts the bottom of tropical seas.

NAVAL COLLEGE. Refer to *Index*.

NAVAL EDUCATION. Refer to *Index*.

NAVAL RESERVE, THE, differs from the Army Reserve in the fact that its members need not have served in the Navy. Practically every able seaman, or man with equivalent qualifications, can join the Naval Reserve, on specified conditions.

NAVARINO (Pylos), a small town in the south-west of Greece, has the best harbour in the country. This bay, then called Sphacteria, saw the Spartans defeated by the Athenians in the great Peloponnesian War (425 B.C.), and it also saw the Turkish fleet annihilated by a combined English, Russian and French fleet in the War of Greek Independence (1829).

NAVARRE, the name of a province (now Basses Pyrenees), in the south of France, and of a province in the north of Spain. In mediæval times the two formed one kingdom of Navarre, which played a prominent part for so small a state. The inhabitants, Basques in Spain and Gascons in France, have marked peculiarities of language and customs.

NAVIGATION ACT. The Act generally meant, when this term is used, is the one passed in 1651, which aimed specially at the Dutch. It enacted that no goods should be imported into England save in English ships, or in ships of the country that produced the commodity. Similar ordinances have been made both before and since, but the whole system is now swept away in England, and any ship is allowed to enter any harbour with any goods from anywhere.

NAZARENES, a sect of Jewish Christians which arose about the end of the first century. They are often confounded with the Ebionites, as, like them, they still regarded the Mosaic Law as obligatory; but the Nazarenes believed in the divinity of Christ, while the Ebionites did not.

NAZARETH, now en-Nasirah, a flourishing little town of Palestine, 21 miles south-east of Acre. Here our Lord was brought up, and sites are shown where some of His doings are said to have taken place.

NAZARITES, a term used in the Bible to denote persons who had taken a vow to abstain from doing certain acts for a time, as a mark of special consecration or devotion to God. The law concerning such vows, laid down in Numbers vi., contemplates a limited period of such observance, but Samuel and others were Nazarites for life.

NEANDER, JOHANN, *b.* 1789, *d.* 1850; a great ecclesiastical historian, critic, and teacher, was born at Gottingen, of Jewish parents named Mendel. He became a Christian in 1806, taking at his baptism a new surname as well as Christian names. His works went through many editions, and even his lectures have been extensively printed.

NEBO, MOUNT. Eastward of the Dead Sea is a range of hills rising higher and higher as we proceed northward, till they culminate in a high peak near the northern extremity of the sea. This is Mount Nebo

(Pisgah), from which Moses had a view of the Promised Land.

NEBUCHADNEZZAR, king of Babylon (604–561 B.C.), was one of the greatest of the monarchs who ruled over that great empire. He restored Babylon to its ancient supremacy. He it was who removed the bulk of the people of Judah to Chaldea, thus completing the desolation of the Holy Land. The discoveries still being made in that interesting land prove what a vast influence he exerted on his country's destiny.

NEBULA, a patch of light in the heavens which cannot be resolved into a cluster of stars. These true nebulæ, as distinguished from the patches of light which do resolve into clusters of stars with a telescope of higher power, consist of gases in an incandescent state.

NEBULAR THEORY. The Nebular Theory maintains that our sun, with its attendant planets, as well as all similar systems, was once a mass of incandescent gas like the nebulæ we see now. By gravitation, the particles began to collect towards a centre, and thus rotation was set up, while by radiation, contraction was caused, and thus masses were loosed from the central body, which became satellites revolving in the same direction as the original mass.

NECKAR, the principal river of Wurtemburg, in Germany, 250 miles long, rises on the eastern side of the Schwartz Wald (Black Forest), and joins the Rhine at Mannheim. Heidelberg, with its celebrated university, lies in its course.

NECROMANCY. The question of holding communication with the dead has always been a subject of fascinating interest to mankind. Whether the Witch of Endor did or did not cause the spirit of Samuel to appear and answer Saul need not be discussed; the point is that a man of his standing believed that such could be done, so that we need not be surprised that savages hold a similar belief. Even here in England, in the 20th century, not a few people believe that one can communicate with deceased friends by the latter tapping on a table.

NECTAR, in classical mythology, is the name given to the drink of the gods; hence it is applied to any drink that gives particular pleasure.

NEGRO (L. *niger*, "black"), a name of rather uncertain application, but which may roughly be said to apply to the inhabitants of that belt of Africa south of the Barbary States, and north of the Congo, and of course to their kinsmen elsewhere. The main characteristics of the race are thick lips, short flat nose, woolly hair, and black skin. They are undoubtedly capable of great culture, and may yet, under favourable circumstances, have a high destiny in front of them.

NEHEMIAH, a pious Jew, whose life for the most part was spent in captivity among the Persians, but who made at least two journeys to Jerusalem, and took a great part in the restoration of the city, its defence against enemies, and its purification from various evils. He was a favourite with the Persian king, Artaxerxes Longimanus.

NELSON, HORATIO, VISCOUNT, *b.* 1758, *d.* 1805; was son of the rector of Burnham Thorpe, Norfolk. He joined the Navy at an early age, and by the year 1787 had earned his captaincy, married, and retired to live at Burnham Thorpe, his native place. The outbreak of war with France, 1793, gave him the chance he longed for; he was appointed to the "*Agamemnon*," and for some years took an active part in the operations about Toulon. Towards the end of 1796 Spain joined France, and it became imperative to prevent their fleets from combining to operate against England. The victory of St. Vincent, February, 1797, which shattered the Spanish fleet on its way to join the French at Brest, was largely due to Nelson's gallantry and foresight. In 1798 the French fleet from Toulon, with the army for Egypt, evaded Nelson, but he came up with it in Aboukir Bay, and took or destroyed all the ships but two. This exploit ended Napoleon's dreams of a great Eastern empire. In 1801, under Sir Hyde Parker, Nelson commanded the operations against Copenhagen and the Danish fleet, which resulted in the surrender of the fleet to England. In 1805 Napoleon made his last great effort to gain command of the sea, and bring his army of invasion to our shores. But Nelson's vigilance never failed. On the 21st October he came up with the combined French and Spanish fleet of 33 sail, near Cape Trafalgar, and although inferior in numbers, gave the signal for battle. The victory was decisive; the combined fleet was annihilated; but the price was great. In the heat of the fight, Nelson received a mortal wound, and died in a few hours. His body lies in St. Paul's Cathedral, and a splendid monument inadequately expresses the admiration all Englishmen feel for his gallantry and devotion to duty.

NELSON MONUMENT, THE, is a lofty column in Trafalgar Square, 145 feet high. It was erected in 1843, at a cost of £45,000. The bronze reliefs at the base represent the Battle of the Nile, Bombardment of Copenhagen, Battle of St. Vincent, and the Death of Nelson. The four lions at the base are the work of Sir Edwin Landseer.

NELSON RIVER issues from Lake Winnipeg, in Canada, and flows north-east into Hudson's Bay, after a course of 400 miles. Numerous rapids and falls render it useless for navigation.

NEM'ESIS, in mythology, the goddess whose part it was, by bringing misfortune and calamity, to humble those who had, in the tide of success and prosperity, forgotten their duty to the gods; hence, we use the term to express the punishment which in some form or other awaits those whose devotion to worldly success is excessive.

NEOPHYTE (lit. "newly-born,"), a term applied in the early church to one just baptised; hence used to denote one who is a beginner in anything.

NEOPTOL'EMUS, in classical mythology, one of the great heroes of the Trojan War. He was one of the warriors concealed in the wooden horse, and killed Priam on the capture of the city.

NEPAL, an independent state of India, lying along the southern slope of the Himalayas. Its area is 54,000 square miles, and population about 3,000,000. The Ghoorkas, who are the ruling race, provide some of the most reliable soldiers in our Indian army.

NEPTUNE. (1) Name of the Romans' god of the sea. When a Roman commander set sail, he would offer to Neptune a sacrifice, which was thrown into the sea. Later, all the attributes of the Greek god Poseidon were transferred to Neptune. (2) Also the most distant of the planets from the sun. Its diameter is about 35,000 miles, and it revolves round the sun in 164½ years. Its existence was proved, and its position indicated, by mathematical calculation, and the use of the telescope was only required to confirm what pure reason had demonstrated.

NE'REIDS, in mythology, sea-nymphs, haunting especially the Mediterranean Sea, as the Naiads did fresh water, and the Oceanides the Ocean.

NERI, PHILIP, *b.* 1515, *d.* 1595; the "Apostle of Rome," was an example of what pure goodness, unallied with intellectual greatness, missionary fervour, or prophetic fire, can accomplish. He founded a monastic order with no perpetual vows, and with charity as the bond of union. Its members are known as the "Fathers of the Oratory."

NERO, CLAUDIUS CÆSAR, the last of the Cæsars, ruled as Emperor of Rome from 54 to 68 A.D. To give a list of his crimes would be tedious and unprofitable. Among those he murdered were his own mother and two of his wives. He invented specially cruel deaths for the Christians, whom he accused of burning the city. Nero's extravagance and oppression caused numerous conspiracies, and at last he committed suicide to escape Galba's victorious army.

NERVA, Emperor of Rome from 96 to 98 A.D., was a man of great wisdom and moderation. Being aged when he obtained the throne, he adopted as his son the energetic Trajan, by whose aid he accomplished the great reforms he had at heart.

NESSUS, in classical mythology, one of the Centaurs, who tried to carry off Deianira, the wife of Hercules. Hercules shot him with a poisoned arrow, and Nessus in his last moments implored Deianira to preserve his blood, as a sure means of keeping her husband's love. Later on Deianira, having dipped a shirt in the blood, presented it to Hercules, and the poison in it killed him.

NESTOR, in Greek legend, king of Pylos, in Greece, was distinguished in youth for valour, and in age for wisdom. At an advanced age he took part in the war against Troy, and his counsels were much sought by the Grecian leaders.

NESTORIANS, a sect of Christians that arose in the 5th century, and rapidly grew in the east until the 13th century, when their numbers began to decrease, and now there are but a few left, who inhabit the mountains of Kurdistan. See *Nestorius*.

NESTORIUS, patriarch of Constantinople, in the early part of the 5th century, maintained that the Virgin Mary could in no sense be called the "Mother of God," although she was the mother of Christ. He was therefore accused of maintaining the two-fold personality of Christ, instead of his two-fold nature (human and divine). He was accordingly deposed, but he had many followers, and the sect is even now not extinct.

NETHERLANDS, THE, a name denoting the tract of country forming the kingdoms of Holland and Belgium. It is the north-western portion of the Great European Plain, and much of it, especially in Holland, lies below the level of the sea. In the Middle Ages it was divided into a number of duchies, counties, and marquisates, all owing a more or less rigid allegiance to the head of the German Empire, but independent of one another. In 1572, owing to the cruelties inflicted on Protestants by the Inquisition, the northern provinces, Holland and Zealand, taking the lead, revolted against Philip II. of Spain. Thus arose the republic of the United Netherlands, now the Kingdom of Holland. The southern provinces remained attached to the Empire till the time of Napoleon. After Waterloo, Holland and Belgium were made one kingdom, but were never comfortable together, and in 1831 the Belgians set up a kingdom of their own, under Leopold of Saxe-Coburg.

NETLEY, a small Hampshire village 3 miles south-east from Southampton. The ruins of the abbey, founded in the 13th century, are imposing, and the Hospital for soldiers, founded after the Crimean War, worth a visit.

NETS. See *Fishing*.

NEVA, a short but deep river in Russia, conveying the water of Lakes Ladoga and Onega to the Gulf of Finland. It is frozen from November to April. St. Petersburg stands on it.

NEVILLE'S CROSS, an old cross on a hill near the city of Durham. Here David of Scotland was routed by the troops of Queen Philippa, wife of Edward III., when he invaded England to aid his friends the French, in the absence of the English king, then in France (1346).

NEWARK, an interesting town of Nottinghamshire, on the right bank of the river Trent, is an important agricultural centre. Its history begins with the Romans, who found here a British town, which they improved into an important station. King John came here to die after being caught in the Wash. The castle, now in ruins, stood three sieges in the Civil Wars; population 15,000.

NEW BRUNSWICK, a small, but exceedingly flourishing province of the Dominion of Canada. With an area of 27,000 square miles, nearly equal to that of Ireland, it has a population of only 330,000. The soil is fertile; the rivers are numerous and navigable; harbours are good; coal and iron abound; everything is there to tempt the industrious settler. St. John, population 40,000, on the Bay of Fundy, is the chief town, but Fredericton, 90 miles up the St. John river, is the capital.

NEWBURY, a town of Berkshire, on the Kennet, 17 miles west of Reading, is a thriving and interesting place. Two battles, in 1643 and 1644, neither very decisive, were fought here in the Civil War; population 11,000.

NEW CALEDONIA, an island belonging to France, lies just about half-way between Australia and the Fiji Islands. Its area is about 8,000 square miles, and its value to France is chiefly as a station for convicts. Many communists were sent there after the anarchy that prevailed in Paris when it had surrendered to the Germans, 1871.

NEWCASTLE-ON-TYNE, the principal city of Northumberland,, situated 8 miles from the mouth of the river, a busy port and a thriving manufacturing town. As a port it depends mostly on the export of coal, and, as a manufacturing town, on the manufacture of iron and on shipbuilding. The Elswick works, founded by Messrs. Armstrong, turn out guns and ships for our own and foreign navies. As a shipbuilding town, Newcastle comes close to Glasgow. Newcastle has seen something of nearly all the struggles that have taken place between England and Scotland. Its history dates back to the Roman period. Its chief magistrate is now styled Lord Mayor. (For population, etc., see p. 902.)

NEWCHWANG, the principal port of Manchuria, is situated near the mouth of the river Liao, flowing into the Gulf of Pechili. Opened as a port to foreign trade by the Chinese in accordance with the treaty of Tien Tsin, in 1858, it has grown in importance until in 1899 its total trade was £7,000,000.

NEWCOMEN, THOMAS, a locksmith of Dartmouth, in Devonshire, may fairly be said to have been the first to put the steam-engine to practical use. The steam-engine, for which he took out a patent in 1705, remained the type in use for pumping water out of the Cornish mines till towards the end of the century, when Watt added the condenser.

NEW ENGLAND, the district in the U.S.A., comprising the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. Here settled the bulk of the English Puritans and Scotch Presbyterians who, in the time of the Stuarts, crossed the Atlantic to enjoy religious freedom. The inhabitants are enterprising and industrious, and to them properly belongs the name of "Yankees."

NEW FOREST, THE, a district in Hampshire, lying west of Southampton Water, and extending westward about sixteen miles to the Southern Avon. About two-thirds of it is Crown property, and is preserved as open woodland or heath. Oaks and beech trees abound, and the whole district is one of singular sylvan beauty. Lyndhurst, population 2,000, nearly in the centre, is the chief village; Brockenhurst, Lymington, and Beaulieu are next in importance. The town of Ringwood is on its western border.

NEWFOUNDLAND, an island and British Colony on the east of Canada, at the entrance to the Gulf of St. Lawrence. Its area is 40,000 square miles, much of it is productive, but the inhabitants, 216,000 in number, depend almost wholly on the fisheries, and their attendant industries. The total value of codfish caught and exported, in some form, is near £2,000,000. The fishing "rights," so long possessed by the French to the serious detriment of Newfoundlanders, were extinguished by the treaty with France of April, 1904, which settled so many risky questions between that country and our own. St. John's, in the east, is the capital.

NEWGATE, long the chief prison of London, was a gloomy stone building east of Holborn Viaduct. Its history goes back to 1218. It was destroyed in the Great Fire of 1666, and again partially in the Gordon Riot of 1780. The last public hanging was in 1868, and in 1902 Newgate was pulled down. On its site will stand the Central Criminal Court.

NEWGATE CALENDAR, a list of the prisoners who have been confined in Newgate prison, with an account of their lives and crimes so far as could be ascertained. The famous prison, one of the oldest in the country, is now pulled down.

NEW GUINEA, OR PAPUA, the largest island in the world except Australia, has an area of 305,000 square miles, of which 90,000 are now definitely acknowledged as British territory, forming a Crown colony in association with Queensland. The Dutch claim the western half of the island and the Germans the portion north of our territory. The inhabitants are not numerous, but they vary surprisingly in habits and language, the people of one part being sometimes unable to comprehend the language spoken only a few miles away. The development of Papua is a matter for the future.

NEWHAVEN, a seaport in Sussex, eight miles east of Brighton, derives its importance from its steamboat communication with Dieppe, and also with Normandy and the Channel Isles; population 7,000.

NEW HOLLAND, a name formerly given to Australia by the Dutch, who first explored its north-west coasts.

NEWMAN (John Henry), **CARDINAL,** *b.* 1801, *d.* 1890, one of the most remarkable Englishmen of the 19th century, was the son of a London merchant. At the age of fifteen he felt a distinct "call" to prepare himself for the ministry. He had a brilliant career at Oxford, where in 1822 he became fellow of Oriel, and where he resided till 1843, exercising an extraordinary influence by his preaching and his personality. In 1833 he joined the "Oxford Movement," and wrote many of the "Tracts for the Times." He was for some years the friend and associate of Dr. Pusey, both striving to mould the Church of England on "Catholic principles;" but, in 1843, Newman's religious views compelled him to resign his living in that Church, and in 1845 to join the Roman Catholic Church. His writings, both in prose and verse, are marked by clearness of thought and purity of style. They include the "Dream of Gerontius," the "Apologia pro suâ vitâ," and the beautiful hymn, "Lead, kindly Light." He was made cardinal in 1879.

NEWMARKET, a town on the borders of Cambridgeshire and Suffolk, owes its prosperity almost entirely to the races held on its heath, and to the training of horses carried on in the neighbourhood. The race-ground on the heath is one of the finest in the world.

NEW MODEL, THE, a standing force raised in 1645 by the Parliament, to act against Charles I. Well paid, trained, and disciplined, it proved too much for the irregular forces it had to encounter, and justified the confidence of Parliament.

NEWNES, SIR GEORGE, *b.* 1851, educated at the City of London School; is the originator of that form of literature of which his own "Tit-Bits" is a type. Starting in a small way in 1881, "Tit-Bits" grew until its circulation and the number of its imitators seemed endless. The paper is now in the hands of a company owning the "Strand Magazine" and many other publications.

NEWNHAM COLLEGE. Refer to *Index*.

NEW ORLEANS, population 317,000, the most considerable city in the south of the United States, stands on low ground at the mouth of the Mississippi river. It can never, from its situation, be a healthy city, but all is being done that is possible to improve its sanitary state. It is the great outlet for the productions of the Southern States, its exports amounting annually to about £30,000,000. New Orleans saw, in the war of 1812–14, the English general, Pakenham, killed and 2,600 of his men placed *hors de combat*, while the Americans under Jackson lost but 8 killed and 13 wounded.

NEWPORT, in Monmouthshire, 4 miles from the mouth of the river Usk. It is a rapidly rising town. It has important iron and chemical manufactures, and exports large quantities of coal and iron. (For population, etc., see p. 902.)

NEW RIVER, an artificial channel cut (1609-20) to convey water from Chadswell Springs, in Hertfordshire, to London, a distance of 38 miles. Sir Hugh Myddleton, the designer, nearly ruined himself over the work; but the original shares, which in the reign of Charles I. would barely fetch £5 each, could not be purchased in 1900 for less than £100,000 a share. When, in 1904, the undertaking was transferred to the Metropolitan Water Board, the New River Company was awarded 6½ millions of its water stock bearing interest at 3 per cent.

NEW SOUTH WALES, the oldest colony of Australia, has now an area of 310,000 square miles. The parent state of Australia, its earliest English inhabitants were the convicts who were landed in Botany Bay in 1788. Free settlers soon followed, and by 1800, Sydney, the capital, had a population of 5,000, which has now grown to 500,000. Refer to "New South Wales" in *Index*.

NEWSTEAD ABBEY, the home of Lord Byron, the poet, is in Nottinghamshire, about 10 miles north of Nottingham. It dates from 1170, and was given to an ancestor of the poet in 1540.

NEW STYLE, a name given to the present mode of regulating the calendar, when it was adopted in 1752. Russia is the only European country that still clings to the "Old Style," which is now thirteen days behind. (See *Calendar*.)

NEWTON, SIR ISAAC, *b.* 1642, *d.* 1727, a great mathematician and philosopher, was born—the house still exists—at Woolsthorpe, in Lincolnshire. Whether the fall of an apple suggested the investigation or not, undoubtedly the discovery by him of the law of gravitation marked an epoch in science. He made great researches into the nature and phenomena of light. In practical life also his services were great, for as Master of the Mint he made many improvements in the coinage.

NEW YORK CITY, population 3,800,000, the largest city in the United States, and second only in size and importance to London, is situated near the mouth of the Hudson River. About half its adult male population were born outside the United States. Its "sky-scraper" buildings, some of them over 20 storeys in height, are a feature of the city. About half the commerce of the United States, to the value of £100,000,000 annually, passes through New York, and its prosperity seems to be still increasing.

NEW ZEALAND. Refer to *Index.*

NEY, MARSHAL, one of Napoleon's most famous marshals, took the oath of allegiance to Louis XVIII. after Napoleon's abdication, and became one of his favourite subjects. On Napoleon's return from Elba he deserted to his old chief, and being taken prisoner after Waterloo, was shot as a traitor.

NIAGARA FALLS, between Lakes Erie and Ontario, are formed by the river Niagara, which drops about 150 feet in sheer descent. About 100,000,000 tons of water fall each hour, developing, it is said, horse-power enough to drive all the machinery in the world. Goat Island, at the top of the falls, divides them into two nearly equal parts; that on the Canadian side is known, from its shape, as the "Horse Shoe Fall."

NIBELUNGENLIED, a German epic poem, whose origin and history, like that of the Iliad, is very doubtful. It was cast into its present form somewhere about 1,200 A.D., but its elements existed long before.

NICÆA, an ancient city of Asia Minor, the chief residence of the kings of Bithynia, and of many of the Roman governors. It is famed in Church history for the Council held in 325 A.D., the outcome of which was the Nicene Creed.

NICARA'GUA, an independent state of Central America, stretching from sea to sea. It has an area of 50,000 square miles.

NICE, an important French town on the Mediterranean Sea near the Italian border. It is a favourite winter residence with those whose inclination urges, and money enables, them to escape the English winter; population, 125,000.

NICENE CREED, THE, (see *Nicæa*) was adopted to declare the Church's belief in the Divinity of Christ, as against the teaching of the Arians, who maintained that He was not equal with God.

NICHOLAS, SAINT, the patron saint of Russia, is supposed to have been bishop of Myra, in Lycia, about 300 A.D. He is the patron of children, and especially of scholars. The name Santa Claus is simply a corruption of his name.

NICHOLAS I., Emperor of Russia, *b.* 1796, *d.* 1855; was one of the most able and vigorous rulers Russia has ever had. Coming to the throne in 1825, he devoted all his energies to the Russianising of all his subjects, and their conversion to the Greek Church. The refusal of the English to join in the spoliation of Turkey, and his subsequent losses in the Crimean War, caused him great grief. He died in the course of the war.

NICHOLAS II., the present Emperor of Russia, succeeded his father Alexander III. in 1894. His own inclinations are probably for peace and reform, but the influence of the military party and the great nobles seems too strong for him.

NICHOLSON, JOHN, *b.* at Dublin, 1822, *d.* 1857, one of the most distinguished of the many English soldiers who have gained distinction in India, had an extraordinary influence over the natives. He is said to have done more than any one man to check the spread of the Mutiny. He was killed in the storming of Delhi.

NICKEL, a white metal whose ore is found in many countries, but abounds in Canada. It is especially valuable for covering other metals, as it is not much injured by damp, or by acids, except nitric.

NIEBUHR, BARTHOLD, *b.* 1776, *d.* 1831, a great German historian and critic, was born in Denmark. His History of Rome and other works show great originality, and the theories he advanced gave a great impulse to the spirit of inquiry.

NIEDERWALD, a hill overlooking the Rhine, opposite the town of Bingen. Here is the statue erected in 1883 as a national memorial of the Franco-German War of 1870–71.

NIGER, THE, the third in importance of African rivers, rises 150 miles from the West Coast and flows in a semi-circular course of 2,600 miles into the Gulf of Guinea. Timbuktu lies near its course. The Benue, its chief tributary, joins it on the left about 250 miles from the sea, which it enters by numerous mouths known as the "Oil Rivers," from the traffic in palm-oil, etc.

NIGERIA, a British territory, including the lower valley of the Niger, and that of the Benue, we owe to the persevering energy of Sir George Goldie. Its importance is being recognised more every day, and it is likely to be developed as a cotton producing country.

NIGHTINGALE, THE, a species of song-bird common in England in the summer, but departing in winter to warmer climes. It sings well into the night, commencing at dusk, and is considered the finest singing bird in the world. Its Persian name, the bulbul, is familiar in oriental fables.

NIGHTINGALE, FLORENCE, the heroine, in one sense, of the Crimean War, was not moved by a sudden impulse to her work there. Born in 1820, she had already spent years in investigating hospital methods and nursing practice. She was thus fitted to take supreme command of the nursing arrangements, and to suggest the various improvements that have helped materially to ameliorate the lot of the sick or wounded soldier on campaign, whilst setting a noble example of self-devotion in the service of suffering humanity.

NIHILISTS are the direct product of the stern repressive rule of Nicholas I. of Russia, and its bureaucratic system of government. They aim at the overthrow of existing institutions, and the reconstitution of society on a socialistic basis. The assassination of the Czar Alexander II., in 1881, was due to the anarchist element among the Nihilists.

NIJNI-NOV'GOROD. See *Novgorod.*

NILE, THE, flows out of Victoria Nyanza and receives the overflow of Albert Nyanza. Thence, under the name of the *White Nile*, it flows north to Khartoum, where it is joined by the *Blue Nile* from Abyssinia. After that it receives the Atbara or *Black Nile*, also from Abyssinia, and flows on for 1,500 miles without another tributary. Its entire length is about 4,000 miles. Below Khartoum its course is broken by six cataracts, and a few miles below Cairo it begins to form a delta of great fertility. Its principal mouths are the Rosetta and Damietta branches. The fertility of Egypt depends on the annual overflow of the Nile, which is brought about chiefly by the yearly rains of Abyssinia, the flood-water coming to the Nile by the Atbara. The supply of water for irrigation purposes has been greatly increased by the building of a gigantic dam at the First Cataract. (See *Assouan.*) The source of the Nile was a great mystery until recent times. In 1858 the Victoria Nyanza was discovered by Speke, and in 1864 the Albert Nyanza by Baker.

NILE, BATTLE OF THE, fought in 1798, between the English (under Nelson), and the French, in Aboukir Bay, near the mouth of the Nile. The French fleet of 13 ships was anchored in a single line at the mouth of the Bay. Nelson contrived to place half his ships between the enemy's ships and the shore, thus placing the French ships between two fires. The battle began at sunset and raged through the night. During the action the *Orient*, the French flag ship, took fire, and was blown to pieces. Only two of the French ships escaped capture or destruction.

NINEVEH, once the capital of Assyria, was situate on the left bank of the Tigris, opposite the modern Mosul. Its ruins have been carefully explored since Sir A. H. Layard began searching for them in 1843. Numerous sculptures and thousands of tablets have been discovered, enabling us to reconstruct Assyrian history for more than a thousand years B.C. The city had a circumference of more than 7 miles, and its walls were in parts 50 feet high.

NINGPO, a port of China, situated on the river Ningpo. It was one of the "Treaty Ports" thrown open in 1842. It exports tea, silk goods, and raw cotton, receiving opium, and cotton and woollen goods; population 255,000.

NINIAN, SAINT, a great and successful missionary preacher in the south of Scotland about the end of the fourth century. Many churches in Scotland are dedicated to him.

NI'OBE, (o-be) in Greek mythology, wife of Amphion, king of Thebes. Proud of her beautiful children, she exalted herself above the goddess Leto, who induced Apollo and Diana to slay all the children with their arrows. Niobe herself was changed into stone through her grief, and even then continued to weep for her misfortunes.

NIRVA'NA, "extinction," the Buddhist expression, imperfect though it be, for the change which, according to Buddhist doctrine, shall end our existence as individuals, and merge us in the being of the Eternal Creator.

NITHSDALE, (William Maxwell,) **EARL OF,** *b.* 1676, *d.* 1744; a Catholic and Jacobite Scotch lord who joined in the rising of 1715. Taken prisoner at Preston, and condemned to death, he escaped from the Tower in woman's clothes through the devotion of his wife. He died at Rome.

NITRIA, a district south-west of the delta of the Nile. Here are the Natron Lakes, around whose dreary waters the monks in the fourth and following centuries settled in great numbers.

NITRIC ACID, an acid with very definite properties, is obtained from nitre, or Chile saltpetre, by treatment with strong sulphuric acid. It acts very readily on metals and organic substances, whence the importance of great care in handling it.

NITROGEN. The remarkable fact about Nitrogen is its inertness, as compared with the activity of nearly all its compounds. Forming about four-fifths of our air, oxygen making nearly the other fifth, it serves

to dilute the oxygen in the atmosphere, and render it fit for us to breathe. It undergoes no change in our lungs, and seems to take no *active* share in the various processes of nature that go on around us.

NITRO-GLYCERINE is an exceedingly dangerous compound of nitric acid and glycerine. Unless most carefully prepared it is liable to explode spontaneously, and in any case will explode with a smart blow. United with cotton, or some such absorbent, it becomes less sensitive, and can be handled with comparative safety. Mixed with an absorbent earth named *kieselguhr*, it forms dynamite.

NITROUS OXIDE, a compound of nitrogen and oxygen, discovered by Priestley in 1772. Producing insensibility for a short time without any bad effects, it is much used as an anæsthetic in minor surgical operations.

NOBEL, ALFRED, *b.* at Stockholm, 1833. *d.* 1896; the inventor of dynamite and other explosives in which nitro-glycerine forms a prominent part. He made a large fortune out of his inventions, the bulk of which, about 1¾ millions, was left in trust to provide five prizes annually, one each for the greatest discovery in physics, chemistry, and medicine; one for the best literary work, and one for the man adjudged to have done the most in the year for the cause of universal brotherhood. Each prize is worth about £8,300. Among distinguished Englishmen who have gained these prizes are Lord Rayleigh, for Physics; Sir William Ramsay, for Chemistry; and Mr. William Cremer, for services in promoting International Arbitration.

NOBLE, a gold coin first minted for Edward III., and so named from being made of "noble" metal, i.e., gold. Its nominal value was half a mark, or 6s. 8d.

NOCTES AMBROSIA'NÆ, a series of papers mostly by John Wilson, better known under his "*nom de plume*" of "Christopher North." They purport to be records of evenings spent at a tavern kept by one Ambrose—hence the name—to which resorted the wits and literary celebrities of Edinburgh, in the early years of the last century.

NODES, two points at which the path of a planet cuts the plane of the ecliptic. The point at which the planet passes to the south of the plane of the ecliptic is called the descending node, and the other the ascending node.

NON-COMMISSIONED OFFICERS are subordinate officers who form a class between the commissioned officers and the rank and file. They are selected from among the private soldiers for their knowledge of military duties, and for their general qualifications, such as conduct, tact, and personal fitness.

NONCONFORMISTS, a name generally used to denote the religious sects that have separated themselves from the organization and communion of the English Church. Strictly, it denotes those sects that refused to submit to the terms of the Act of Uniformity (1662), and left the English Church. Refer to "Nonconformists" in *Index*.

NON-JURORS, holders of public offices who declined to take the oath of allegiance to William III. and Mary, because they held that James II. was king, by lawful and divine right. Among their numbers were Archbishop Sancroft, six bishops, and over 400 clergy.

NORE, THE, a sandbank 3 miles from Sheerness, guarded by a lightship. In 1797 British sailors on board the fleet mutinied here on account of their ill-treatment. Their pay was poor, and, in case of sickness or incapacity from wounds, it was stopped; their food was bad, and flogging was allowed. The leader, Richard Parker, was hanged with seventeen others.

NORFOLK, DUCAL HOUSE OF. The Howard family was settled in Norfolk as far back as the 10th century. In the 15th century Sir Robert Howard married the daughter of Mowbray, Duke of Norfolk, and his son, Sir John Howard, was created in 1483 Duke of Norfolk and Earl Marshal of England, an office hereditary in the family ever since. The present duke (1906) is the 15th to bear the title, and holds the proud position of "Premier Duke" of England. He served in the Boer War, and has done other good service, both in political and municipal affairs.

NORFOLK ISLAND, a small island about 900 miles east of Brisbane, belonging to Great Britain. The inhabitants are descendants of the mutineers of the British ship *Bounty*, who first settled in Pitcairn Island and removed here in 1855. It was formerly a station for the worst kind of convicts.

NORMAN ARCHITECTURE is the name applied to the style of building that flourished under the Norman kings of England (1066-1189). It is exemplified in almost all our cathedrals and in many of our old parish churches and castles. As a rule, it is characterised by the massiveness of its walls and columns, and by the exclusive use of the semicircular arch for doors, windows, arcades, and groining. Generally the windows are small and placed at a considerable height. One of the most pleasing features of later Norman work is the great wealth of intricate and even grotesque ornamentation with which the mouldings of doorways and arches were adorned. The general resemblance between Norman work and late Roman architecture has led to the use of the term *Romanesque*, to distinguish the Norman from the Gothic style that followed it.

NORMAN CONQUEST, THE, of England began in 1066, when Duke William of Normandy defeated the Saxon king Harold, at the battle of Hastings. William was elected to the throne by the Witenagemote, and crowned on Christmas Day, 1066. The chief posts in the Church, and the best lands in the country were given to Normans, but the English laws were not set aside, and the English language still held its ground, but was enriched by many words of French origin. In order to protect themselves from the power of the Norman nobility, the kings had to seek the support of the people and of the Church, and thus constitutional government began to develop. Through the chivalrous spirit of the Norman knights, the learning of the Norman clergy, and the refinement of the Norman ladies, a higher kind of civilisation in England was the result of the Norman Conquest.

NORMANDY, a province on the seaboard of Northern France. It took its name from the Norsemen or Danes, who settled there in the 9th century, and it was a duchy of the Kings of England from 1066 to 1204. Its chief city is Rouen, and Havre is its leading port. Its watering places along the coast, and its historic towns and handsome Norman churches have made it a resort of tourists. It is a country of well managed farm-lands, fruit farms, and orchards.

NORMANS, or **NORSEMEN,** the people of Denmark, Norway, and Sweden, who raided the shores of Western Europe, and effected permanent settlements in England and the Continent during the 9th and 10th centuries. They settled in Normandy and in the north and east of England; they invaded Russia, and they ventured as far as Constantinople, where they took service under the Emperor, and formed his Varangian Guard. As a rule, they attacked coast towns, and ran up the estuaries of the rivers in their long boats. Their popular name, *Vik-ings*, denotes that they were "dwellers in the creeks," a seafaring folk whose home was by the sea.

NORTHCOTE, SIR STAFFORD. See *Iddesleigh*.

NORTH, LORD, *b.* 1732. *d.* 1792; the chief minister of George III. from 1770 until 1782, the period during which the American Colonies won their independence and became the United States. He was a man of ability, resource, and good-humour, but his power was more nominal than real, the king keeping all real power in his own hands.

NORTHALLERTON, the chief town of the North Riding of Yorkshire, is an important junction on the North-East Railway, and a busy market town. Near it was fought the battle of the Standard in 1138.

NORTH AMERICA. See *America, North*.

NORTHAMPTON, the county town of Northamptonshire, stands on the river Nen. It is the centre of the English trade in boots, shoes, and leather. It has an interesting Norman Church, built by the Knights Templars in the 12th century. A battle in the Wars of the Roses was fought near this town, when Henry VI. fell into the hands of the Yorkists, 1460. (For population, etc., see p. 902.)

NORTH CAPE, a striking promontory forming the most northerly point in Europe, being about 6 miles further north than Cape Nordkyn, the most northerly point on the mainland. As the North Cape lies within the Arctic Circle, during each summer the sun remains continuously above the horizon for a few days. Hence tourists come here to see the "Midnight Sun."

NORTH SEA, THE, or **GERMAN OCEAN,** is a shallow sea with a maximum depth of 600 feet, situated east of Great Britain. It contains many sandbanks, one of which, the Dogger Bank, is a famous fishing ground, where large fleets of fishing-boats assemble during the summer months. The shallowness of the sea, with its variety and wealth of marine life, make it a great feeding-ground for shoal fish. This sea is one of the great commercial highways of the world. Many lines of passenger and cargo boats ply between the British ports of London, Harwich, Hull, Hartlepool, Newcastle, Leith, and Aberdeen, and the continental ports of Ostend, Antwerp, and Hamburg, together with the ports of the Baltic. Fog and stormy weather render the North Sea treacherous, the fog being particularly dangerous owing to the many in-shore sand-banks, and because of the large number of boats that are constantly crossing or coasting from port to port by well defined routes.

NORTHUMBERLAND, the most northerly county of England, has rich deposits of coal in the south, where the Tyne forms an excellent waterway for the development of the coaling and kindred industries. Between Newcastle and North Shields the river is lined with ship-building yards, chemical works, and coal wharves. Alnwick, the county town, is the centre of a district rich in historical associations. The Roman Wall, much of which is in an excellent state of preservation, crosses the moorlands west of Hexham.

NORTHUMBRIA, an old Anglian kingdom founded in the 7th century, and extending from the Humber to the Forth. Edwin, the first king of Northumbria, gave to Edinburgh its name.

NORTH-WEST PASSAGE, THE, was a route across the North Atlantic and the Arctic Seas, by which many navigators, from Hawkins to Franklin, vainly sought

to reach the Pacific. The names of the straits and bays of the Arctic coast of America stand as a record of the unavailing gallantry of these men. The passage has been discovered, but owing to the ice, is quite impracticable.

NORTH-WEST PROVINCES, THE, form a province of British India under the rule of a Lieutenant-Governor. It comprises the fertile and densely populated district of the upper waters of the Ganges and Jumna, and includes the towns of Meerut, Agra, Lucknow, Cawnpore, Allahabad and Benares; area 83,000 square miles, population about 36,000,000.

NORTHWICH, a town of Cheshire on the river Weaver, the centre of the salt-mining industry; population 15,000.

NORTON, THE HON. MRS., *b.* 1808, *d.* 1878; a novelist and poet, was a granddaughter of Richard Brinsley Sheridan.

NORWAY, the western part of the Scandinavian peninsula, is a mountainous country whose coast is indented into most beautiful fiords. From 1814 to 1905 it was united with Sweden under one king, but it now forms a separate kingdom. The capital is Christiania, and Bergen is the chief port. Hammerfest is the most northerly town in Europe. The population of Norway is 2,250,000.

NORWICH, on the river Wensum, is the county town of Norfolk, and the seat of a bishopric. Its cathedral has a fine Norman nave and an elegant spire. Formerly Norwich was the centre of a great woollen industry; now it manufactures crape, boots, and small textile goods. (For population, etc., see p. 902.)

NOSTALGIA, a word of Greek origin, meaning home-sickness. The Swiss are said to be particularly affected by it when long absent from their native land.

NOTATION OF NUMBERS is the art of expressing numbers in symbols, and of arranging them so as to simplify calculations. The Arabic notation employs the symbols 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and we have retained these symbols in developing our common or *decimal system* of notation. The Roman notation is still retained by us in a few cases, such as the numbering of the Psalms and in dates on the title pages of some books, but it is awkward for calculations, and may be considered to be merely an interesting survival.

NOT PROVEN, a verdict allowed in criminal cases in Scotland when the evidence is insufficient for a conviction, but strong enough to give probability to the charge. The prisoner cannot be tried again for the offence, even though fresh evidence should be produced. A moral stigma, however, remains on him for life.

NOTRE DAME (Fr. "Our Lady"), a title of the Virgin Mary much used in France. Of the many churches dedicated to "Notre Dame," the great cathedral of Paris is the most noteworthy. This was founded in the 12th century, and thoroughly restored in the 19th. It suffered greatly during the Revolution of 1789 and the Commune of 1871. The façade and the flanking towers are considered very fine.

NOTTINGHAM, a handsome, well-built city on the Trent, largely employed in lace, hosiery, and leather industries. Its castle, magnificently placed on a limestone rock, commands a wide view of the Trent valley. In 1642 Charles I. raised his standard at Nottingham, and commenced his struggle against the parliamentary forces. (For population, etc., see p. 902.)

NOVARA, a town near Milan, where the Sardinians were completely defeated by the Austrians in 1849.

NOVA SCOTIA, a province of the Dominion of Canada, forming a peninsula, connected by a low isthmus with New Brunswick. Its western part is very fertile, and its apples are said to be the best in the world. Halifax, the terminus of the Inter-colonial Railway, has an excellent harbour and naval dockyard. Being free from ice in the winter, Halifax is the great winter port of the Dominion. The population is about 500,000.

NOVATIANS, THE, a Christian sect, followers of a priest named Novatian, who, in the 3rd century, taught that those who had fallen away in idolatry or grievous sin might not be received back as members of the Church.

NOVA ZEMBLA, an island off the north coast of Russia, forming, as it were, a broken continuation of the Ural Mountains. It was visited by Sir Hugh Willoughby in 1553, and is now an occasional resort of seal-hunters, fowlers, and fishermen.

NOVELS. The name *novel* is of Italian origin, and was used at first to denote short stories such as were written or collected by Boccaccio. The modern novel, however, is as far removed, in development and variety, from the mediæval story as the garden rose from the hedge-row briar. It covers the whole range of prose fiction under the general aim of delineating real life and character. It began to assume its present form in England after the Restoration (1660) under Defoe, Richardson, Fielding, Sterne, and Smollett, and one of its earliest features was that it brought women into the ranks of literary workers.

NOVGOROD, or **NIJNI-NOVGOROD,** a town on the Volga in Russia, 200 miles east of Moscow, and the seat of a great annual fair which lasts from July to September. Here the traders of the west meet the caravans of the east, and goods to the value of £18,000,000 are sold. Nijni-Novgorod (Lower Novgorod) is to be distinguished from Novgorod proper, which is about 100 miles south of St. Petersburg. Like all the great fairs of Europe, the annual fair of Nijni is declining under the extension of railways.

NOVUM ORGANUM, THE, "or Indications respecting the Interpretations of Nature," was part of a greater work which Bacon contemplated but did not complete. It deals with methods of scientific observation, and served to re-instate that system of minute observation and experiment which characterized the research work of the Ancient Greeks. The *Novum Organum*, which means "the new instrument," was published in 1620.

NOYADES, LES. (Fr. *noyade*, "drowning."), a series of public drownings committed by order of Jean Baptiste Carrier at Nantes during the Revolution. The prisons were full of Vendean captives (See *Vendée, La*), and to lessen the number he caused whole barge loads to be drowned in the Loire, whose water was so poisoned that its use for drinking and cooking was forbidden.

NUBIA, an ill-defined district to the south of Egypt proper, now included under the name *Egyptian Soudan*.

NUMIDIA, a Roman province of Northern Africa, corresponding with the northern part of modern Algeria.

NUMISMATICS, or the study of coins and coinage, is of great use as an aid to the study of history, and is interesting as a means of tracing the development and decline of art in different ages and different lands. The earliest coins were stamped on one side with the head or emblem of a deity, the other being at first left blank, but afterwards some local figure or emblematic group was added. The side bearing the head is called the *obverse* side, and the other the *reverse* side. Alexander the Great (300 B.C.) substituted his own portrait for the figure of the deity, and this practice has been followed since. The earliest English coins are the silver pennies of the Saxon kings. Edward III. introduced the gold *noble*, or half-mark (6s. 8d.), and the silver *groat* (4d.). The *mark* was a continental coin rather than an English one. He also struck *florins*, coins which took their name, and perhaps their value, from the banks of Florence. Edward IV. struck a coin bearing the figure of *St. Michael and the Dragon*, and, therefore, called an *angel*. *Sovereigns* and *crowns* were introduced by the Tudors, and the gold brought from the Guinea coast gave its name to the *guinea*, first struck in the reign of Charles II. The portraits on the obverse of English coins may be considered authentic from the time of the Tudors.

NUNC DIMITTIS, the name of the Song of the aged Simeon, who sang it in thanksgiving for having been allowed to see the infant Saviour (St. Luke ii. 29). The words *Nunc Dimittis*, "now thou art letting depart," are the two first words of the Latin version of the canticle, which forms part of the Evening Service in the English Prayer Book.

NUNCIO (Italian *nuncio*. "a messenger,") a papal ambassador who is not a cardinal. In the latter case the ambassador is called a *legate*.

NUNS, members of religious orders of women bound by their vows to a life of celibacy and seclusion. Like monks, they are separated from the world, and the act of initiation is known as "taking the veil." The Mother Superior, or Abbess, possesses extensive powers over the sisters or nuns of her Convent; but as the priestly offices cannot be performed by a woman, each community is under the jurisdiction of a bishop.

NUREMBERG or **NURNBERG,** in Bavaria, the most quaint and fascinating of mediæval German towns, is the centre of an industry in wooden toys and in watches. It is a city of quaint-gabled houses, of beautiful bridges, and handsome fountains, of narrow overhanging streets, and of old-world courtyards; population, including the suburbs, 265,000.

NUTATION. (1) The point in the heavens to which the earth's axis points, and which is known as the *celestial pole*, is not fixed, but describes a circle among the stars, the circumference of which is a sinuous line. The backward and forward motion of the pole which produces the sinuosities is known as Nutation (L. *nutare*, to nod), and is due to a similar motion of the earth's axis, which arises from the fact that, from time to time the moon exerts a greater attractive force on one pole than on the other. (2) In Botany, the turning of plants and flowers towards the light. The movements are produced by unequal growth. Cases of *simple* nutation are seen in plants grown in windows. The growth is more vigorous in the parts removed from the direct light, and the plants bend towards the window. In some cases there is a more vigorous growth of each side in succession, and the nutation is said to be *revolving*. This is conspicuously exhibited by climbing plants, such as the hop, bean, etc.

NUTMEG is the kernel of the stone inside a pear-shaped fruit that grows on trees about 25 ft. high, in Madagascar, Brazil, the Moluccas, and the West Indies.

NYANZA. See *Albert Nyanza* and *Victoria Nyanza*.

NYASSA, LAKE, discovered by Livingstone in 1859, is the southernmost of the Central African Lakes. It lies 400 miles from the coast, and its waters are carried by the Shiré river into the Zambesi. It has an average width of 40 miles, and is 400 miles long.

NYMPHS were the female divinities who, according to Greek mythology, in-

habited the ocean, the streams, the woods, meadows, hills, and fountains. The dwellers in the ocean and seas were called *Oceanides* and *Nereids;* those of the fountains and inland waters were known as *Naiads;* and those whose home was in the woods were named *Dryads.*

OAK, the most durable, the darkest and toughest of European timbers, is grown in all temperate climates as far north as latitude 64°. It is one of the longest-lived trees, and for that reason individual specimens have often served as landmarks as well known in their way as villages or buildings. As a material for building, the oak was formerly largely used for roof-beams and supports, but it was for the building of ships that the English oak was in greatest demand. From the reign of Charles II. until iron was used for ships, the Government kept a strict hold on the oak forests of the country. The bark of the tree is used for tanning. The gall or oak-apple is used in the manufacture of ink and also in tanning. Of recent years the timber has been extensively used for household furniture and cabinet work.

OAK-GALLS. See *Galls.*

OAKS, THE, a race for three-year-old fillies over the Derby course, run at Epsom on the Friday after the Derby.

OAKUM, the material produced by tearing asunder the strands of old hempen ropes. It is employed for caulking the seams between the planks of vessels to prevent leaking.

OASES are spots in the desert rendered fertile by the presence of water. The wells are usually surrounded by palm-trees, which offer a refreshing shade to the caravans that use the oases as resting places on their route. By sinking artesian wells, the French have created oases in the deserts of Northern Africa.

OATES, TITUS, the originator of the infamous "Titus Oates Plot," was an adventurer who, after disgracing himself whilst a naval chaplain, entered a Jesuit establishment in Spain, and was dismissed for misconduct. On his return to England, he alleged that the Roman Catholics were conspiring to kill the king and to overturn the government. The result of this and other false evidence was that eighteen prominent Romanists were put to death. Oates was himself imprisoned for perjury, but was released subsequently and granted a pension.

OATS, a grain crop that flourishes in latitudes too cold for wheat. They are brought to great perfection in Scotland, the North of England and Canada. They form an invaluable food for horses, and yield the well-known oatmeal.

OBELISKS, (1) are four-sided monuments of stone with pointed tops. Their proper position is on either side of the doorway of an Egyptian temple, and like Cleopatra's Needle, a well-known obelisk on the Thames Embankment, they were usually engraved with hieroglyphics. (2) are reference marks, thus (†)

OBER-AMMERGAU, a small town of 1,400 inhabitants, near the southern border of Bavaria, and 45 miles from Munich. Here the well-known Passion-Play is reverently acted by the inhabitants every tenth year. The next representation will take place in the summer of 1910.

OBERON. In Shakespeare's "Midsummer Night's Dream," Oberon is the King of the Fairies, and husband of Titania. The story of his quarrel with Titania is also the subject of a poem by Wieland and of an opera by Weber.

OBLIVION, THE ACT OF INDEMNITY AND, passed in 1660, was an act of general pardon passed on the restoration of Charles II. With the exception of the regicides, who had sat in judgment on the late king, pardon was granted to all who had had a share in the troubles of the Civil War.

OBOE, or **HAUTBOY,** is a treble instrument to which the bassoon is the natural bass. Each is a reed instrument with considerable power of crescendo. The oboe has the privilege of giving the pitch to the stringed instruments in an orchestra.

OBOLUS, an ancient Greek coin of silver or copper, the sixth part of a drachma. It was the custom to place the coin in the mouth of a corpse as a payment to Charon for ferrying the spirit across the Styx.

O'BRIEN, JAMES FRANCIS, *b.* 1831. *d.* 1905. In 1867 he was condemned to death for taking part in a Fenian rising. The sentence was commuted to imprisonment for life, but after a few years' imprisonment he was released. He entered Parliament in 1885, and was a staunch supporter of Mr. Parnell until that leader's fall in 1890. He also held important offices in the Irish National League and the United Irish League.

O'BRIEN, WILLIAM, *b.* 1852, a journalist, author, and Nationalist M.P. He began life as a reporter, and in 1880 became editor of "United Ireland," which he had been instrumental in starting as the organ of the Land League. The part he took in the Irish agitation of 1887-91 led to his being prosecuted nine times and imprisoned for upwards of two years. He is also the founder of the United Irish League and of its organ, "The Irish People." His published works include "When we were Boys," "Irish Ideas," and "Recollections."

O'BRIEN, WILLIAM SMITH, *b.* 1803, *d.* 1864; an Irish patriot who entered Parliament in 1826, and was shortly afterwards imprisoned for resisting the authority of the Speaker. In 1841 he joined O'Connell in the agitation for the repeal of the Union, but separated from him on the question of the employment of physical force, and became the leader of the Young Ireland Party. An attempt at an insurrection in 1848 was easily suppressed; O'Brien was captured, tried, and sentenced to death. The sentence was commuted to transportation for life, and a pardon was granted in 1856. In the same year he published "Principles of Government" or "Meditations in Exile."

OBSCURANTISTS are those who wilfully hinder the advance of knowledge, progress, or reformation, or who look with distrust and prejudice upon a departure from old lines of thought.

OBSERVATORY, an institution furnished with the necessary means and appliances for making astronomical observations. Modern astronomical work dates from the discoveries of the astronomical clock, and of the use of the telescope by Galileo. National observatories, such as that at Greenwich, act as a central time-keeping authority, and undertake the important work of rating naval chronometers. The American observatory of Lick is one of the best appointed observatories of the present day.

OCCULTATIONS. When the moon intercepts and hides a star or planet from the view of observers on the earth, the star is said to undergo occultation, or hiding.

OCEANIA, a name applied to the islands and archipelagoes of the Pacific Ocean. It includes Australasia, the Malay Archipelago, and the innumerable islands and reefs that lie in the South Pacific Ocean.

OCE'ANUS. The ancients believed that the world was a flat plane, with an inner sea, the Mediterranean, surrounded by land. The Mediterranean communicated by the Straits of Gibraltar with an outer ocean, which they believed encircled the land, and to this they gave the name Oceanus.

OCHRES are natural earths used as colouring matter or pigments. They are found chiefly in Anglesey and Devonshire. The colouring matter in the earth is an oxide of iron, and although ochres can be prepared, the natural earths are much more permanent and reliable than the artificial colours.

O'CONNELL, DANIEL, *b.* 1775. *d.* 1847; an Irish orator and politician surnamed "The Liberator." He became famous as an advocate, was the leader of the agitation that ended in the Catholic Emancipation Act, 1828, and afterwards the leader of the agitation for the Repeal of the Union. Monster meetings were held (1840-43). At length these were proclaimed, and O'Connell was arrested and convicted for seditious conspiracy, but the sentence was reversed on appeal. The "Young Ireland" party arose in his old age urging the use of physical force, but O'Connell was opposed to their methods, and retired from public life in 1846.

O'CONNOR, FEARGUS, *b.* 1796. *d.* 1855. He was elected to the reformed Parliament of 1832 as a member for Cork, but subsequently was unable to secure a seat until 1847, when he was returned for Nottingham. He obtained considerable influence over advanced politicians, took an active part in the Chartist movement, and voiced the opinions of the Chartists in Parliament. In 1852 he developed symptoms of insanity, and was removed to an asylum.

O'CONNOR, THOMAS POWER, *b.* at Athlone, 1848. He has been a prominent member of the Irish Nationalist party since 1880, and has represented a division of Liverpool since 1885. A brilliant journalist, with a keen insight into the public taste, he excels in the writing of personal paragraphs and descriptive reviews. The latter, under the heading "A Book of the Week," he made a special feature of the *Weekly Sun* and *T. P's. Weekly.* He successfully launched the *Star,* the *Sun,* and *M.A.P.*, and founded another gossipy journal similar to the last with the title *P.T.O.*, in the first number of which he remarked, "Three times in succession I succeeded in making a paper into a property of value on the day it was started." He is the author of "The Parnell Movement," "Napoleon," and "In the Days of my Youth."

OCTAVIA, (1) the wife of Mark Antony, whom he deserted for Cleopatra. (2) the wife of Nero, who was divorced and executed by him.

OCTAVIUS, CAIUS. See *Augustus, Cæsar.*

OCTOPUS, an eight-limbed cuttle-fish found usually inshore, among the rocks, where it feeds on shell-fish and molluscs. They are timid creatures, but it is doubtful if the descriptions of the dangers of a meeting with the larger specimens are altogether fanciful. The giant octopus is certainly dreaded in Eastern seas. They have been known to reach the extraordinary length of 70 feet from the end of one limb to that of another, but few measure more than 20 feet. The majority of British species are quite small. The tentacles or suckers on the under side of the limbs enable them to cling to the rocks, and to bind down crabs and lobsters while the octopus crushes them with his parrot-like beak.

ODDFELLOWS are members of a Friendly Society for mutual assistance and insurance in case of sickness or death. "The Independent Order of Oddfellows" is a secret society whose lodges were united

in 1813 as the *Manchester Unity*. The financial administration and the organization of this pioneer society were admirable, and the Royal Commission of 1871–4 relied largely on the excellent tables and statistics provided by its officers in making the report that was embodied in the Friendly Societies Act of 1875. Besides the Manchester Unity, there is a smaller union known as the "*United Order of Oddfellows*." The combined membership amounts to about one million. Refer to "Friendly Societies" in *Index*.

ODE, a lyrical poem originally intended to be chanted or recited to the accompaniment of a stringed instrument. Milton's "Ode on the Morning of Christ's Nativity," and Dryden's Odes, "For St. Cecilia's Day," and "Alexander's Feast," are among the greatest we possess.

ODER, THE, rises in Moravia, and flows through Silesia and Prussia to the Baltic Sea. Ratisbon, Breslau and Frankfort stand on its banks, and Stettin at the head of the Haff or estuary at its mouth. Its lower waters are sluggish, and navigation is impeded by accumulated silt.

ODESSA, the chief port of Russia on the Black Sea, exports sugar, wool, corn and flour. It is the fourth city of Russia in point of population. It is frequently visited by cholera, and it is regarded as one of the centres of Russian disaffection.

ODIN, or **WODEN,** the Scandinavian god of war, held his court in Valhalla, surrounded by the fallen heroes of the battlefield, and here two ravens brought him tidings of the outer world. His name is preserved in *Wednesday* or Woden's day, and in such place-names as *Wednesbury*.

ODYSSEUS or **ULYSSES,** the famous Greek adventurer, whose deeds are sung by Homer in the *Odyssey*. He was a man of great ability and cunning devices, and a great traveller. He gained the armour of Achilles in a struggle with Ajax, and was one of the heroes of the Trojan war. His wife Penelope, the ideal of wifely constancy, refused to listen to the temptation of the suitors who beset her during her lord's long absence.

ODYSSEY, THE, is a great epic poem written by Homer, recounting the doings and wanderings of Ulysses.

ŒRSTED, HANS CHRISTIAN, *b.* 1777, *d.* 1851. a Danish physicist and chemist, was one of the pioneers in the field of electro-magnetic research.

OFFA'S DYKE, an earthwork reaching from the mouth of the Dee to that of the Wye. It was probably a British boundary dyke, fortified, and utilised for defence by Offa, King of Mercia (758–796).

OGLETHORPE, GENERAL, *b.* 1698, *d.* 1785, founded the colony of Georgia in the reign of George II., who granted him the land for the purpose. His object was to provide a refuge for English debtors and for the persecuted Protestants of Germany.

OHIO RIVER rises in New York State, and joins the Mississippi 200 miles south of St. Louis. It passes Pittsburg, Cincinnati, and Louisville, and is navigable for 800 miles.

OHM, the unit of electrical resistance. All substances offer a certain amount of resistance to the passage of an electrical current, silver and copper resisting the least. An Ohm is the amount of resistance in a wire of pure copper, 485 metres long and one millimetre in diameter, at 0° centigrade.

OHM, GEORGE SIMON, *b.* in Bavaria, 1787, *d.* 1854; a celebrated mathematician and physicist, and the discoverer of Ohm's law. This law, that the strength of an electric current varies directly with the electromotive force causing the flow, and inversely with the resistance in the circuit, he first deduced mathematically, and afterwards proved by experiments.

OIL CAKE, the husk of certain seeds with the residual oil. It is made by pressing rape-seed, linseed or cotton-seed, so as to squeeze out most of the oil. It is used as a food for sheep and cattle.

OIL GAS, combustible gas produced by the decomposition of petroleum or other oil. The oil is passed from an air-tight reservoir, in regulated quantities, into retorts which are maintained at a red heat. In the retorts the oil is decomposed into a mixture of gases, which, after purification, may be conveyed through pipes to any desired point, or may be rendered easily portable by compression. The gas burns with a brilliant white light, and it is claimed for it, that, since it is entirely free from sulphur compounds, it contaminates the air less than coal gas, besides being more economical. It has been employed for lighting railway carriages, lighthouses, buoys, etc.

OIL WELLS are found principally in Pennsylvania and New York State in America, and near Baku on the Caspian. In the natural state they occur oozing from cracks in the rocks, but they are worked by boring into the rock. In the American petroleum area, the crude oil is transferred under pressure by pipes to the refining works.

OKU, BARON, *b.* 1847, a great Japanese soldier. He first proved his abilities as a soldier during the Satsuma Rebellion of 1877, in which he held the castle of Kumamoto four months while besieged by the insurgents, then forced a passage through their lines, and joined the imperial forces. He added to his reputation during the Chino-Japanese War, and in the great war of 1904-5 he played an important part. After gaining the victory of Kinchau, he took command of the left wing of the Japanese army in Manchuria, and assisted in the great battles of Liao-Yang, the Shako, and Mukden.

OLAF, SAINT, *b.* 995, King of Norway, 1015, was a stern opponent of Norwegian paganism. He was deposed and the crown offered to Canute, against whom Olaf fell fighting. He was buried in Trondheim Cathedral, and became the national Saint of Norway.

OLD BAILEY, THE, adjoining the old Newgate Prison, has long been the central Criminal Court for London and Middlesex. It consists of an "*Old Court*," where the grave offences are tried, and the "*New Court*," for petty offences. As the court is usually crowded, a fee to the doorkeeper, or a special permit from a sheriff or alderman is necessary to obtain a good seat. The Lord Mayor is nominally the presiding judge, but the Recorder of London, the Common Sergeant, or the Judge of the Sheriff's Court usually presides.

OLDCASTLE, SIR JOHN, Lord Cobham, a prominent Lollard in the reign of Henry IV. and Henry V., was instrumental in distributing the translations of the Scriptures made by Wyclif, and in maintaining travelling preachers. He was a gallant soldier and did excellent service in France. He was examined and condemned for heresy on the accession of Henry V. It is thought that his escape from the Tower was winked at, but he was recaptured in 1418, and burnt. Lollardy was considered a serious menace both to the Church, to the royal house, and to social order.

OLD CATHOLICS, THE, were at first a party established within the Roman Church, in 1870, by Dr. Döllinger and other professors at Munich, as a protest against the doctrine of the infallibility of the Pope. Afterwards they became a separate sect, and assumed their own organization, but they have declined in influence of late years.

OLD GROG, a nick-name of Admiral John Vernon, *b.* 1684, *d.* 1757, who used to wear grogram breeches and who aroused the angry feelings of his sailors by insisting that they should mix water with their spirits. Hence the name "grog" came to be applied to the rum and water served out to sailors.

OLDHAM, one of the leading cotton towns of Lancashire, lies about 6 miles north-east of Manchester. It owes its rapid growth to the rich coal beds in the immediate neighbourhood. In addition to the staple manufacture, silks, velvet, hats, machinery, and leather are produced. (For population, etc., see p. 902.)

OLD MORTALITY, the title of one of Sir Walter Scott's novels, published in 1816. As the introduction to the novel shows, "Old Mortality" was an eccentric stone-mason, named Paterson, who deserted his home, and spent his days in repairing the tomb-stones and inscriptions to Covenanters buried in out-of-the-way churchyards in Scotland.

OLD SARUM, the old town of Salisbury, 2 miles from the present city, now exists only as a grassy mound. Bishop Poore removed the seat of his bishopric to the new site in 1220, because it was more conveniently situated. The liturgy or *use* of Old Sarum was largely used by Cranmer in forming the Book of Common Prayer. Until 1832 Old Sarum continued to send members to Parliament.

OLD STYLE. See *Calendar*.

OLIPHANT, LAURENCE, *b.* 1829, *d.* 1888, a traveller, diplomatist and writer, who retired after a busy career in various parts of the world, to live as a religious recluse in Palestine.

OLIPHANT, MRS. MARGARET, *b.* in Midlothian, 1828, *d.* 1897, a prolific writer of fiction, biography, and history. She had the rare power of making details interesting, and the womanly gift of sympathetically portraying the gentler emotions. Her "Makers of Florence" Lives of "Edward Irving," "Jeanne d'Arc," and "Saint Francis of Assisi" represent a side of her work far removed from fiction, but demanding scholarliness and sympathy of treatment.

OLIVE, THE, is cultivated in southern Europe for the oil which is extracted from its fruit. It grows to a height of 20 to 30 feet, and has peculiar grey-green leaves, which give a characteristic colour to Italian landscapes.

OLIVER TWIST, the hero of a novel by Charles Dickens, is a gentle lad thrown among London thieves after an early workhouse life.

OLIVES, MOUNT OF, a ridge 700 feet high lying to the east of Jerusalem. At its foot, on the side of the city, lay the Garden of Gethsemane, and there our Lord used to retire in the evening after the turmoil of the day in Jerusalem.

OLLA PODRI'DA, a common dish in Spain, consisting of a stew of meats and vegetables. Hence it has come to mean a mixture or conglomeration.

OLNEY HYMNS, a collection of hymns composed at Olney, in Bucks, by the poet Cowper and the minister of Olney.

OLYMPIAD, the period of four years that intervened between the celebrations of the Olympic Games. It became common among Greek writers to reckon in Olympiads from the year 776 B.C.

OLYMPIC GAMES, THE, were held every four years amongst the Greeks in the pleasant valley of Olympia, and formed a grand national festival. None but Greeks might compete, and no women or slaves might be present. Competitors trained for ten months, and the victors

received as their reward a garland of wild olive.

OLYMPUS, MOUNT, a chain of mountains between Thessaly and Macedonia, fronting the Ægean Sea, with steep precipices. Its highest peak (9,750 feet), was considered in Greek mythology to be the abode of Zeus and the gods.

OMAR, THE MOSQUE OF, was erected on the site of the temple at Jerusalem, by the Mohammedan Caliph, Omar, who took the city in 636, A.D.

OMDURMAN, a small Soudanese town near Khartoum, the scene of the victory of Lord Kitchener over the Dervish forces on September 2, 1898.

OMENS, or **PORTENTS,** are occurrences which are supposed to influence one's luck, ill or favourably. Thus ravens are considered birds of evil omen, and the presence of a raven under certain circumstances would be regarded by some persons as distinctly unlucky.

OMNIBUS, a four-wheeled public conveyance, so named because intended for the public in general, the word *omnibus* in Latin meaning "for all." (See *Shillibeer.*)

ON'EGA, LAKE, the largest of European lakes, drains into Lake Ladoga, whose waters are carried by the Neva through St. Petersburg into the Gulf of Finland.

O'NEIL, HUGH, Earl of Tyrone, rebelled against the English in Ireland in 1597. The Earl of Essex failed to subdue him, but Lord Mountjoy, his successor, utterly defeated him and his Spanish allies, at Kinsale. Tyrone was pardoned, and died in 1616.

ONTARIO, the richest and most populous province of Canada, separated from Quebec by the Ottawa River, and extending along the northern shores of the Great Lakes, and beyond Lake Superior to the Lake of the Woods. From Toronto, its capital and chief town, large quantities of corn, fruit, petroleum, and timber are exported. The province is rich in minerals, the nickel supply being the greatest in the world; population about 2,200,000.

ONYX, a precious stone, largely used for cameos. It is marked by alternating stripes of black and white, and the best varieties are found in India.

OOLITE (o'-olite), a kind of limestone built up of round granules. The name means literally, the egg-stone, and it is so named from its markings having a general resemblance to the roe or eggs of fish; e.g. Portland stone and Bathstone.

OPERA, a dramatic composition set to music. It aims at combining the effects of vocal and orchestral music with the scenic and dramatic effects of the stage.

OPIE, JOHN, R.A., *b.* 1761, *d.* 1807, the son of a Cornish carpenter, became Professor of painting to the Royal Academy. His historical paintings "The Slaughter of Rizzio" and "Arthur and Hubert," are well known examples of the school of art in which he excelled.

OPIUM, a most valuable medicine obtained from the dried juice of the heads of poppies, gathered before they are ripe. The two central opium factories in India are at Patna and Ghazipur, on the Ganges. When used habitually as a narcotic, opium produces disastrous after-effects. In minute doses it blunts the nerves and allows the imagination to have freer play. Hence arises the terrible "opium habit" to which brain-workers have so often become victims. See *Med. Dict.*

OPIUM WAR, THE, 1840-2, had its immediate cause in the destruction of a large quantity of opium brought by British merchant vessels into China against the wishes of the Chinese government. The result of the war was that the Chinese paid an indemnity, opened Tientsin, Chifu, Chinkiang, Shanghai, Ningpo, Amoy, and other towns as "Treaty Ports," and ceded Hong Kong.

OPORTO, a seaport at the mouth of the Douro, in Portugal. It exports cattle, oranges and fruits, cork and copper, and it is the chief place of export for port wine, which takes its name from that of the town: population 140,000.

OPOSSUM, a marsupial about the size of a large cat, found in the United States. It is very timid and lives chiefly among the branches of trees. In the abdominal pouch, the young (ten to fifteen at a time) are nourished, and in it they take refuge when alarmed. Its prehensile tail greatly assists its movements. The appearance of death assumed by this animal when caught is probably due to temporary paralysis caused by fear. The fur is used for cloaks, muffs and trimmings.

OPTICS, the science which deals with the nature and properties of light. Of all the phenomena connected with light, none are more important than reflection and refraction, and to understand these it must be borne in mind that rays of light travel *from* an object *to* the eye, and that the image of the object or the object itself is seen in the direction in which the rays enter the eye; thus an image seen in a plane mirror appears opposite the object and equi-distant to it from the reflecting surface. *Refraction* takes place when a ray of light passes from one medium into another of different density, provided the ray does not strike the surface of the refracting medium at right angles. A close investigation of refraction has led to remarkable perfection in the construction of lenses for spectacles, telescopes, microscopes, etc., and to this phenomenon, through the agency of the spectroscope, is due the knowledge we have acquired of the constituents of most of the visible heavenly bodies.

ORACLE. Among ancient peoples, especially the Egyptians and the Greeks, it was customary, before embarking upon some important step, to resort to a temple and question a priest or priestess, or even, through one of them, a god or goddess, as to the success of the undertaking. The answer given was usually so ambiguously worded that it was rarely wrong. The name oracle was equally applied to the individual consulted, to the reply, and to the temple. The best-known oracles were those at Thebes and Ammonium in Egypt, and that at Delphi, in Greece.

ORANGE, a well-known fruit grown largely in most of the fertile parts of the world enjoying a sub-tropical climate. England's chief source of supply is Spain. The orange-tree is an evergreen, about 20 feet high when full grown. Of sweet oranges, the St. Michael from the Azores, the Maltese with its blood-red pulp, the large, juicy Jaffa, the Mandarin with its loose rind, the seedless Majorca and the tiny Tangerine are most esteemed. The bitter Seville orange is used for making marmalade. The leaves and flowers yield a volatile oil used in the manufacture of perfumes, especially Eau-de-Cologne.

ORANGE, a small town near Avignon, in the South of France, once the capital of a small independent principality of the same name. In 1531 the principality passed by marriage to the younger branch of the ducal house of Nassau. The Counts of Nassau, the leaders of this younger branch, became known thenceforth as Princes of Orange, and one of them became King of England as William III., in 1688. By the Treaty of Utrecht in 1713, the principality was annexed to France.

ORANGEMEN, a political society formed in 1688, to support the succession of William, Prince of Orange, to the English throne. It languished for many years, but was revived in 1795 to counteract the influence of numerous secret Roman Catholic Societies. Ireland is the head-quarters of this association, and it possesses many thousands of members in the colonies. In its organisation it resembles free-masonry, and its existence has been marked by opposition to Roman Catholicism and warm support of Protestantism.

ORANGE RIVER, THE, rises in the mountains of eastern Basuto Land, and flows for 1,000 miles in a general westerly direction into the Atlantic Ocean. The greater part of its course forms the northern boundary of Cape Colony. The Vaal is its chief tributary. It is of little use for navigation, owing to its shallowness in the dry season, and to the strength of its current after heavy rains. There is also a bar at the mouth.

ORANGE RIVER COLONY, a British colony acquired by conquest in the course of the Boer War (1899-1902). It was originally founded in 1836 by emigrant Boers from Cape Colony, and from 1854 to its annexation by Britain, existed as an independent republic under the name of the Orange Free State. Refer to "Orange River Colony" in *Index.*

ORANG-OUTANG, an anthropoid ape found in the forests of Borneo, Sumatra and Malacca. Its body and limbs are covered with reddish-brown hair, and, when standing, its arms extend nearly to the ankles. When full grown it attains a height of from 4 to 5 feet. Fruit forms its principal food, and in inclement weather it builds a rough nest or hut among the branches of trees. When taken young it is almost as docile as the chimpanzee, though inferior to the latter in intelligence.

ORATORIO, a sacred subject put to music, so called because musical compositions of this kind were first given in an *oratorio* or small mission-hall in Rome in the 16th century. Handel, Haydn, and Mendelssohn have produced the finest oratorios. Of Handel's oratorios the most celebrated are "The Messiah" and "Israel in Egypt." On an equality with these is Mendelssohn's "Elijah," and at a lower level, Haydn's "Creation."

ORBIT, the path followed by a heavenly body in its journey round any other heavenly body, e.g., the path of the moon round the earth, or of the earth round the sun. These orbits are usually of elliptical form, the centre of the larger and governing body occupying one of the foci of the ellipse. The orbits of many of the comets are parabolic.

ORCHARDSON, WILLIAM QUILLER, *b.* at Edinburgh, 1835, an eminent British portrait and subject painter. His first academy picture was hung in 1864. He became an associate in 1868, and 9 years later was elected an academician. His pictures, "Napoleon on the Bellerophon," "Her First Dance," and "Her Mother's Voice," are in the Tate Gallery. Other important pictures by the artist are the "First Cloud," and a "Mariage de Convenance."

ORDEAL, a crude method of trial adopted by primitive peoples to settle disputes or to establish the guilt or innocence of one accused of crime. Ordeal by fire and ordeal by water were the two methods most commonly practised in the Middle Ages. The former consisted in grasping with the bare hand a red-hot iron, or in walking barefoot and blindfolded over nine red-hot ploughshares. The latter consisted in plunging the hand to the wrist or elbow into a vessel of boiling water and extracting a stone. In both

cases the degree of injury suffered was taken as a proof of guilt or innocence. The method was open to the practice of trickery by the judges, but may have been satisfactory in a period when ignorance and superstition were more likely to lead to an avowal of guilt.

ORDERLIES are soldiers detailed to perform certain routine duties connected with barrack life, or to act as messengers, etc., to commanding officers. It is the business of the orderly officer to pay visits of inspection to every barrack room, and to receive reports on defaulters or complaints concerning the rations. An orderly man in every barrack room is responsible during one week for the cleanliness of the furniture, etc., used in common by all the men.

ORDERS, HOLY. Refer to *Index*.

ORDERS IN COUNCIL are orders issued by the Sovereign with the advice of the Privy Council. Refer to "Privy Council" in *Index*.

ORDERS OF KNIGHTHOOD, ETC. In modern times these are associations whose members possess an honorary distinction conferred on them by the Sovereign or other ruling authority. The name "order" is also applied to the rank or title so bestowed. Of foreign orders the most important are:—Austria-Hungary, the Golden Fleece (1429); the Annunziata (1362); Prussia, the Black Eagle (1701); Russia, St. Andrew (1698); Japan, the Chrysanthemum (1876); France, the Legion of Honour (1802). Refer to "Orders of Knighthood" in *Index*.

ORDNANCE COLLEGE. Refer to *Index*.

ORDNANCE SURVEY, the survey of the British Islands undertaken by the Government for the purpose of map construction. The scheme was the outcome of the difficulties met with by the English troops in the Jacobite rebellion of 1745, and soon after that date the survey of northern Scotland was entrusted to the Master-general of the Ordnance. This led to a general survey of the British Isles, a task which occupied civilian surveyors and selected men from the Royal Engineers nearly a century, the work being completed in 1852. This survey was considered unsatisfactory, owing to the vagaries of different parliaments in the matter of scales, and in 1863 the survey was begun again on more systematic lines. The scales adopted were as follows:—towns over 4,000 inhabitants, 1-500th, and parishes in cultivated and populous districts, 1-2,500th of the linear measurement; counties, 6 inches to the mile; kingdom, 1 inch to the mile. The maps are extremely accurate, and in the case of towns and districts, show the most minute details. Apart from their scientific and military uses, they are valuable for railway and road construction and for various land improvements.

O'RELL, MAX. See *Max O'Rell*.

ORES. In nature very few metals are found in a pure state, and then only in small quantities. They are generally combined with other chemical elements. These compounds of the metals—oxides, carbonates, silicates, sulphides, etc., are known as *ores*, and are the sources from which the metals are derived. They occasionally occur in layers between the various rock strata, but more frequently as "veins" or "lodes," filling fissures in the masses of rock, where it is supposed the metallic matter has been deposited by the infiltration of water containing the salts of the metal in solution. In the "banket" reefs of the Transvaal and in other porous rocks, the ore is found distributed fairly evenly throughout the whole rocky mass, and has probably originated from the deposits from percolating water. The heavier ores are occasionally found in alluvial deposits or "placers," having been deposited by running water which has conveyed the lighter substances to a greater distance.

ORES'TES, a hero of Greek tragedy, who slew his mother Clytemnestra for the cruel murder of his father Agamemnon. Pursued by the avenging Furies, he fled to Athens, where, aided by Apollo, he was purged of his crime. His sister Electra married Pylades, the faithful friend of Orestes.

ORGAN. The principal parts of this musical instrument are (1) a wind-chest, in which air is compressed by means of bellows worked by manual labour, hydraulic power, an oil or gas engine, or an electric motor; (2) pipes of varying length, in which the musical notes are produced by the vibrations of columns of air; (3) a number of tubes and other mechanical contrivances for conveying air from the wind-chest to any particular pipe; and (4) the key-board, each key of which controls a valve which opens or closes the air passage connecting a pipe or set of pipes with the wind-chest. The largest instruments, such as the one in the Sydney Town Hall, that in the Albert Hall, London, and the organs of Notre Dame and St. Sulpice, Paris, have as many as five wind-chests and key-boards, each combination of a wind-chest with its key-board representing a distinct organ. Thus we have the *great organ*, a very powerful instrument; a smaller *choir-organ*; the *swell-organ*, enclosed in a case which may be opened or closed at the will of the performer, and thus produce effects of light and shade in the fulness of tone; the *solo-organ*; and the *pedal-organ*, the key-board of which is manipulated by the feet.

ORGIES, originally the secret rites observed at the festivals of certain mythological deities, especially Bacchus. The wild license which accompanied many such festivals has caused the word "orgies" to be applied to any gathering marked by drunken debauchery.

ORIEL WINDOW, an upper-story window with two or more sides, which stands out from the face of the wall, leaving a recess or "oriel" in the room within. It is supported by brackets or corbels, and such windows add much to the grace of buildings of the Elizabethan type. The name is seldom applied to windows constructed on the ground floor.

ORIENTATION, the act of turning, when engaged in religious devotions, towards the East. Applied to churches, it refers to constructing them so that an observer directly facing the chancel looks eastwards. This architectural detail, however, is by no means universal.

ORIFLAMME, a royal standard of France, so called because the staff was covered with gold and the outer edge of the red silk of which the flag was made was cut in the shape of flames. It was originally the banner of the abbey of St. Denis. Louis VI. (1108–1137), as protector of the abbey, adopted it as his standard, and until the reign of Charles VII. (1422–1461), it was the national emblem of France. "Mont-joie and St. Denis" was for centuries the French battle-cry.

ORIGEN, *b.* at Alexandria, 185, *d.* 254 A.D., one of the most famous of the Fathers of the Church, was the son of a Christian martyr. He became the leading lecturer in Alexandria on Christianity. His ordination as a presbyter by the bishops of Jerusalem and Cæsarea during his visits to Palestine, led to friction with the bishop of his native town, and he was expelled from Egypt. For twenty years he lived at Cæsarea, where his literary and theological lectures were largely attended. He died at Tyre worn out by tortures undergone during the Decian persecution. He was a prolific author of theological and other works, among which was his famous "Hexapla" (which see).

ORIGIN OF SPECIES, See *Darwinism*.

ORINOCO, THE, one of the great rivers of South America, rises in the Sierra del Parima in Venezuela, and after a circuitous course of 1,500 miles through magnificent tropical forests and extensive llanos, flows, by means of several channels, into the Atlantic. A natural canal, the Cassiquiare, joins it to the Rio Negro, a tributary of the Amazon. Numerous affluents make the volume of water in this river enormous, and for nearly half its course its width is over three miles, while during floods the width even at places far from the sea is often 100 miles. Navigation begins below the fine cataract of Atures, 900 miles from the sea.

ORKNEY ISLANDS, THE a group of islands off the north coast of Scotland, twenty-eight of which are inhabited, the largest being Pomona or Mainland, Hoy and Sanday. For many centuries they were held by the Norsemen and their descendants, but Denmark, in 1590, ceded them to James III. of Scotland. The islands are neither beautiful nor fertile, but great improvements have been made in the last fifty years in agriculture and the breeding of horses, sheep, and cattle. Kirkwall, the capital, is the centre of a cod and herring fishery; population less than 30,000, and decreasing, according to the census of 1901.

ORLANDO FURIOSO, "Orlando mad," the name of an epic poem by the great Italian writer, Ariosto, produced in the 16th century. It deals with the deeds of the famous knights of the court of Charlemagne.

ORLEANS, a city and important railway junction on the Loire, France. It lies in the centre of a fertile plain, and has figured prominently in history. The Huns besieged it in 451; the English invested the town in 1430, but failed to prevent Jeanne d'Arc from bringing effectual relief. During the Franco-Prussian war, in 1870, it was the scene of important operations. Its industries are inconsiderable, but its transit trade by rail, road, and canal is very large; population nearly 70,000.

ORLEANISTS, the name given to the adherents of the House of Orleans, one of the members of which, Louis Philippe, replaced Charles X. on the throne of France, as a result of the revolution of 1830. A revolution in 1848 led to his abdication and flight. His grandson, Prince Louis Philippe Robert, Duke of Orleans, still entertains hopes of recovering the French crown. In 1890 he entered Paris and offered to perform his term of military service as a Frenchman, but was forthwith conducted to the frontier. In 1896 he married an Austrian princess, and receives his adherents chiefly at Brussels.

ORMOLU, an alloy of copper and zinc closely resembling gold in colour and appearance. In France the term *or moulu* is applied to a paste composed of gold and mercury used for gilding.

ORNITHORHYNCHUS, a small aquatic quadruped found in parts of Australia and Tasmania, where it burrows in river banks. It has a soft thick fur of a dark-brown colour, a beaver-like tail, a broad flat bill like a duck, webbed feet, the hind ones possessing palms like the mole and spurs like the game-cock, pouched cheeks like the squirrel, and four horny teeth with which it chews the worms and water-insects that form its chief food. The

young are hatched from eggs, two in number, and afterwards suckled. The animal is very timid, and when full grown measures about 18 inches in length. Mallangong (the native name), duck-mole, platypus, water-mole, duck-bill, are variant names for the composite creature.

ORPHEUS, a legendary poet and musician of Greece, famed for his mastery of the lyre, which he received from Apollo. Dionysius (Bacchus) chose to regard him as a dangerous rival. He accompanied the Argonauts in their search for the Golden Fleece. He also descended into Hades to recover his wife, Eurydice, and by his marvellous music obtained her release, only to lose her again through disobeying the injunctions of Pluto. [See *Eurydice.*]

ORRERY, a mechanical model of the Solar System, which when set in motion illustrates approximately the movements of the planets and their satellites. It was first constructed in 1715 at the expense of Charles Boyle, Earl of Orrery, and though popular for nearly a century, is now regarded as a rather superior toy.

ORRIS ROOT, the dried underground stem of a species of iris, a native of the south of Europe. It was formerly largely employed in medicine, but is now chiefly valued for its perfume, which closely resembles that of violets. It is also used in the preparation of various tooth-powders.

ORSINI, FELICE, COUNT DI, *b.* 1819. *d.* 1858; an Italian revolutionist, a member of the society of Young Italy, and an ardent supporter of Mazzini. He took an active part in several abortive attempts at insurrection, was sentenced to the galleys for life in 1844, amnestied 2 years later, and condemned to death in 1855, but escaped from prison early in the following year. In 1858, by means of a bomb, he attempted to assassinate Napoleon III. and the Empress Eugénie as they were leaving the opera. He was condemned to death and executed.

ORTON, ARTHUR. See *Tichborne Trial.*

OSAKA, an important city and open port of central Japan. During the last ten years its trade has increased enormously, and it is now the chief centre of the tea and rice trade of Japan. It possesses a fine citadel and numerous canals; population exceeds 800,000.

OSBORNE HOUSE, a building in the Italian style standing in beautiful grounds on the crest of a gentle slope facing the Solent, about one mile west of Cowes. It was bought by Queen Victoria in 1845, and for many years it was her favourite winter residence. Here she died, January 22nd, 1901. Edward VII., in 1903, presented it as a gift to the nation, stipulating that it should be used as a convalescent home for military and naval officers. The rooms occupied by the late Queen are preserved and are open to the public. At Osborne, also, has been established a naval school, at which all cadets receive their first training.

OSCAR II., *b.* 1829, succeeded his brother in 1872 as King of Sweden and Norway. On several occasions during his reign the two countries have been on the brink of civil war, peace being maintained only by concessions on the part of the king. The union of the two countries was finally dissolved by a commission of the two parliaments in 1905, and Oscar II. now governs Sweden only. He has distinguished himself in literature, has translated poetical works into Swedish, and has published a volume of poems. His "Carl XII." is a valuable contribution to history.

OSIER, the name of several species of willow. In England, Holland, Belgium and France they are often planted in damp, alluvial soils, especially on or near river-banks, and cultivated for the sake of their long, tough and slender branches, which are employed in basket making. In appearance they are low and bushy with no pronounced trunk.

OSIRIS, the chief of the deities of Ancient Egypt, who probably represented Light and embodied all good agencies. After conquering Egypt, he was killed in a struggle with his brother Set, who was exactly opposite him in nature. Osiris was to the Egyptians, above all things, the beneficent God of the dead. He appears under many forms, particularly as the Sun and the Nile. The worship of Osiris continued up to the rise of Christianity.

OSMAN DIGNA, *b.* 1836, was the son of a slave dealer of mixed Arab and Turkish descent. He followed his father's profession in the Soudan, and helped to foment the rebellion of the Soudanese against the Egyptian government in 1881. He had great influence with the tribes and became the principal adviser and military commander of the Mahdi. He made two unsuccessful attacks on Suakim, 1883 and 1888. After the Mahdi's death he seems to have lost his influence, and shortly after the battle of Omdurman, in 1898, a body identified as his was found in the bush.

OSMAN I., *b.* in Bithynia, 1259. *d.* 1326; the founder of the Ottoman Empire. In 1299, with a band of Tartars, he forced the passes of the mountains in the north-west of Asia Minor, and, reinforced by robbers, escaped slaves, and prisoners, wrested several provinces from the Eastern Roman Empire. The territory thus acquired formed the nucleus upon which his successors built the Ottoman Empire, and in the course of a couple of centuries made themselves the first military power of Europe.

OSTEND, a busy port and watering place of Belgium. Its sea-wall, 3 miles long, makes a fine promenade, and the town contains ample accommodation for the 20,000 summer visitors who seek Ostend for health and pleasure. It has a considerable fishing trade, and exports dairy-produce, rabbits and oysters. From 1601 to 1604 it held out against the Spaniards in the great struggle for Dutch independence; population about 20,000.

OSTRACISM, a method employed by the ancient Athenians of banishing citizens whose influence was considered prejudicial to the State. The right of pronouncing sentence of banishment was vested in the people, who, if there was a general desire expressed to exercise this right, deposited on a fixed day, in a sort of polling-station, a small earthen tablet called an *ostrakon*, on which was written the name of the individual that each voter considered deserving of banishment. Six thousand votes were necessary to drive a man into exile, and some of the most famous of Greek leaders underwent this punishment. No forfeiture of property or civil rights was entailed, and after five or ten years the exiles were allowed to return. Ostracism effectually checked the centralisation of power in one individual.

OSTRICH FEATHERS. England's chief source of supply in these feathers is South Africa, where, since 1867, the ostrich has been domesticated and is reared on farms specially devoted to the industry. Such farms also exist in Algeria, Egypt, Australia and California. The valuable white feathers with their graceful droop are obtained from the wings of the male bird, the feathers from the female being spotted and inferior in quality. Clipping begins when the birds are about nine months old, and is repeated every eight months, twenty to forty feathers being taken from each bird at a time. The plumes are most perfect in birds three years old. They are sold by the pound, the price varying from 30s. to £40.

OSTROGOTHS. See *Goths.*

OSWALD, SAINT, king of Northumbria, 625 to 642. During his reign he established Christianity in his kingdom, and laboured with the help of Saint Aidan to raise the condition of his subjects. He fell in battle against Penda, King of Mercia, the champion of the pagan element in England.

OTAHEITE, same as *Tahiti*, which see.

OTAGO, a large province occupying the southernmost portion of South Island, New Zealand. The name still exists, although the provincial system was abolished in 1876. It was first colonised, chiefly by Scotsmen, in 1848. The greater part of the province is mountainous, but in the east and south are many fertile plains and valleys. Rich gold fields extending over two and a half million acres exist, coal is abundant, and the output of wheat and oats is yearly increasing. Dunedin, the capital, is the chief port.

OTHELLO, one of Shakespeare's great tragedies, named from its chief character, a Moor of high spirit and generous nature in the military service of Venice.

OTTAWA, (1) a large and important tributary of the St. Lawrence which flows through valuable timber forests, and after a course of about 700 miles enters the St. Lawrence by two channels that enclose the island on which stands Montreal. (2) a very progressive town on the above river, and the capital of the Dominion of Canada. It has an enormous timber trade, the logs being brought down by the Ottawa and its tributaries. The Chaudiere Falls supply the motive power for numerous saw, flour and paper mills that line the river banks. The Canadian Pacific Railway passes through the city, and so does the Rideau Canal, which joins the Ottawa River to Lake Ontario; population over 60,000.

OTTER, an aquatic fish-feeding mammal found in many rivers of Europe and Asia. Its feet are webbed and it is an expert swimmer and diver. The thick, soft fur is highly prized, but the English species is chiefly hunted for the sport it affords.

OTTERBURN, a village at the foot of the Cheviot Hills in Northumberland. Here, in 1388, an English army under Harry Hotspur was defeated by a much smaller Scottish force under the Earl of Douglas. Accounts of the battle are given in Froissart's "Chronicles," the Scotch ballad "Otterburn" and the English ballad of "Chevy Chase."

OTTO, or ATTAR, OF ROSES, a volatile aromatic oil prepared from the petals of various species of roses, particularly the damask and the musk rose. Roses are especially cultivated for this purpose in the Balkan Peninsula, North India, Persia and Syria. Otto is obtained by distilling rose leaves which have first been well mixed with water. Over 3,000 lbs. of petals are required to prepare 1 lb. of otto. Alone, it has too powerful an odour to be pleasant, and it is chiefly used in the manufacture of other perfumes, of soaps, and of dentifrices. Otto varies in price from 25s. to 40s. per ounce.

OTTOMANS, the name given to the Turks inhabiting the territories under the rule of the Sultan of Turkey. The Turks are of Tartar origin, and in the 6th century A.D. they occupied the banks of the Irtish. In the 11th century a powerful Turkish empire, including Persia, Media and Syria was founded in Western Asia. In 1299, on the fall of this empire, a Turkish chieftain, named Othman or Osman,

descended, with his tribe, on the west of Asia Minor, wrested several provinces from the Eastern Empire of the Romans, and founded a sultanate which later developed into the Ottoman Empire, so called from its first founder. The Ottomans invaded Europe in 1355, conquered Macedonia, Albania, and Servia, captured Adrianople and fixed there their capital, and cut off the Eastern Empire from the west of Europe by a broad band of conquered territory. Constantinople fell before them in 1453, and has been ever since the centre of the Ottoman government. Under Suliman I. (1502–1556) the Ottomans reached the height of their power. Belgrade, the great bulwark of the West, fell to him, Rhodes was captured, Buda in Hungary taken, Persia subdued, and the finest islands of the Archipelago wrested from the Venetians. After his death, luxury, vice and official corruption crept in, and little now remains in Europe of a power that once threatened to overwhelm Christendom.

OUDENARDE, a small town of East Flanders, on the Scheldt, Belgium. Here, in 1708, the French under Marshal Villars were defeated by an allied army under the Duke of Marlborough and Prince Eugene.

OUDH, a province of British India enclosed by Nepal and the North-West Provinces. It consists principally of a gently sloping, fertile plain, watered by the Ganges, Gumti, Gogra and Rapti Rivers. It was under Mogul rule from 1194 to 1819, when the Vizier assumed the title of king. Its annexation by Britain in 1856 was one of the causes of the Mutiny, the Oudh sepoys turning against Britain almost to a man. It is administered by the lieutenant-governor of the North-West Provinces. Wheat, barley, rice, indigo, and opium are its chief products. Capital, Lucknow. Area, 23,966 square miles; population about 13,000,000.

OUIDA, pseudonymn of Louise de la Ramée, a popular English novelist, *b.* at Bury St. Edmunds, 1840. Among the best of her numerous books are "Strathmore," "Under Two Flags," "Puck," and "Moths."

OUTRAM, SIR JAMES, *b.* 1803, *d.* 1863, a distinguished English general. Entering the army of the East India Company in 1819 as a cadet, he early showed great ability. He took part in the Afghan War, 1839, and in disguise rode in eight days from Khelat, through the enemy's country, to Karachi, a distance of 355 miles. In 1843 he successfully held Haiderabad in Sind against 8,000 Beluchis. In 1857 he led a brilliantly successful expedition against Persia to prevent the occupation of Herat by that country. During the Mutiny he aided General Havelock in relieving the Residency at Lucknow, and gallantly held it against overwhelming odds till it was finally relieved by Sir Colin Campbell. His tact on various missions, his chivalrous spirit in serving under Havelock, his junior officer, his skill as an administrator, and his fearless denunciation of official venality entitle him to the admiration and gratitude of his fellow-countrymen.

OUTRIGGER. 1. An iron bracket with a rowlock at the extremity, fixed to the side of a boat in order to increase the leverage of the oar without widening the boat. 2. A framework projecting from the side of certain sailing boats and canoes to prevent the vessel from heeling over.

OVATION, a lesser triumph granted to a Roman general whose conquests were not deemed worthy of the regular triumph. The general, crowned with a garland of myrtle instead of laurel, and preceded by a band of flutes in the place of trumpeters, entered the city on foot. The senate took no part in the procession to the Capitol, nor was the general necessarily accompanied by his army. The sacrifice offered consisted of a sheep.

OVERBECK, FREDERICK JOHANN, *b.* at Lubeck, 1789, *d.* 1869, a German painter who, with four fellow-artists, founded a new school of art by returning to Scriptural subjects as treated by Italian artists previous to the Renaissance. Though scoffed at and ignored for many years, his works at last brought him into prominence. His frescoes are much admired, notably those illustrating the history of Joseph. Of his oil-paintings, "The Influence of Christianity on Art," at Frankfort, and "Christ's Entry into Jerusalem," at Lubeck, are the best known.

OVERBURY, SIR THOMAS, a knight of considerable culture in the reign of James I., who was an intimate friend of Robert Carr, the unworthy favourite of that king. Overbury tried to dissuade Carr from his avowed intention of procuring a divorce between the infamous Countess of Essex and her husband, and then marrying that lady. Overbury's action coming to the ears of the Countess, she procured his arrest, and with the connivance of Carr, now her husband, had him poisoned in prison. In the resulting trial, the infamous pair were found guilty, but received the royal pardon, though banished from Court.

OVERLAND ROUTE, the route to India and the East across the continent of Europe. The quickest journey is made by taking train from Calais to Brindisi, whence a steamer leaves for Port Said, where the Indian steamer may be joined. Another favourite route, taking about two days longer, is to cross France by rail from Calais to Marseilles, and then take the boat which proceeds direct via the Suez Canal. The name was first applied to the route across the Isthmus of Suez (from Alexandria to Suez) before the canal was cut.

OVID, (P. Ovidius Naso) *b.* 43 B.C., *d.* 17 A.D., a great Roman poet, who wrote the "Metamorphoses" and the "Fasti." For his licentiousness he was banished by Augustus to the shores of the Black Sea, where he died.

OWEN GLENDOWER. See *Glendower*.

OWEN MEREDITH, the nom-de-plume under which the second Earl Lytton published several volumes of poems. His chief productions are "Clytemnestra and other Poems" (1855), "Lucile" (1860), and "King Poppy" (1875).

OWEN, ROBERT, *b.* at Newtown, Montgomeryshire, 1771, *d.* 1858, a zealous social reformer. Born of humble parents, he rose by industry and ability to be partner in a cotton-mill at New Lanark, the other partners being, like himself, earnest reformers. All but 5 per cent of the profits were devoted to the social improvement of the employés. After thirteen years he severed his connection with this undertaking, and began setting up social communities on his own plans. Failure and loss of money resulted. In his later years he devoted much time to spiritualism. His "Book of the New Moral World" insists on social equality.

OWEN, SIR RICHARD, *b.* at Lancaster, 1804, *d.* 1892, one of the greatest of modern zoologists. From 1830 to 1856 he was engaged in producing valuable descriptive catalogues of the Hunter Collections in the Royal College of Surgeons, and in lecturing on Comparative Anatomy. From 1856 to his resignation in 1883 he superintended the Natural History Department of the British Museum. His patience, his wonderful knowledge and the wide range of his researches put him almost on the same level with Cuvier.

OWL, the name of a group of nocturnal birds, species of which are found in almost all parts of the world. Its head is large, the ears often provided with a kind of lid, and the eyes, which are directed to the front, have irises which expand under the influence of light, so as to reduce the pupil almost to a point during the day. The English variety, the barn-owl, feeds on insects and small mammals, such as mice. From its nocturnal habits and its uncanny screech, the owl has from very early times been regarded by the superstitious as a bird of ill omen.

OXFORD is situated between the rivers Isis and Cherwell, near the point where they unite to form the Thames. Its university is much celebrated. Parliaments were frequently held here, and during the greater part of the Civil War it was the head-quarters of Charles I. Its antique buildings, its beautiful surroundings and its numerous historical associations, make this one of the most interesting towns in the world; population 50,000. For "Oxford University" refer to *Index*.

OXFORD, EARL OF. See *Harley*.

OXFORD MOVEMENT, THE. The name of a famous religious movement in the Church of England, originating or finding its main support in the University of Oxford. Among its chief promoters were Keble, Newman, and Pusey. These and other earnest Churchmen wrote a series of Tracts, from 1828 to 1841, giving prominence to the sacramental system and corporate life of the Church. Hence the movement received the name of *Tractarianism*. The last tract of the series, "Remarks on certain passages in the Thirty-nine Articles," produced a crisis, which led eventually, 1845, to Newman and many others "going over to Rome," while Dr. Pusey remained as the leader of the High Church party.

OXYGEN, a widely-distributed, gaseous element which enters largely into many compounds, and is necessary for all animal life. It was first isolated from the air by Priestley in 1774. The commercial process of obtaining oxygen follows that of Priestley in principle. Barium oxide on being heated to a dull redness extracts oxygen from the air. On further heating, or by a reduction of the gaseous pressure, this additional oxygen is given up by the new compound and can be collected. Oxygen is odourless, colourless, a supporter of combustion and of life, and combines readily with other elements and compounds to form new compounds. The latter process is known as oxidation.

OYAMA, MARQUIS, *b.* 1844, chief commander of the Japanese army during the Russo-Japanese War. As Japanese military *attaché* to the French army during the war of 1870 he was able to observe the military methods and organisation of two European powers, and on his return to Japan he assisted in reorganising and modernising the Japanese army. He was employed in suppressing the Satsuma rebellion of 1877, and in the Chino-Japanese War he captured Talienwan, Port Arthur, and Wei-hai-wei. Under his supreme command the Japanese army was everywhere successful throughout the war with Russia. In 1906 King Edward conferred upon him the British Order of Merit.

OYSTER, a marine, bivalvular mollusc, much esteemed as an article of food. Before assuming its adult form it moves freely about. Oysters occupy beds varying in depth from 3 to 20 fathoms, but are often cultivated in shallow ponds of brackish water near the sea-shore. From May to

September, the breeding season, English oysters are not obtainable. It is calculated that each oyster produces about 400,000 eggs annually, of which only about 400 reach maturity. Unless grown in pure water, oysters are apt to contain germs of typhoid fever. The beds of Whitstable in England, Marennes in France, and Long Island Sound and Chesapeake Bay in the United States, produce the best-known varieties.

OZONE, a form of oxygen which occurs in small quantities in pure air and in the vicinity of electrical machines when working. Each molecule contains 3 atoms, while molecules of oxygen have but 2 atoms. Hence its density is to that of oxygen as 3 : 2. It has greater oxidising power than oxygen, bleaches some vegetable colours, and possesses a pungent odour. It is very unstable and decomposes rapidly into oxygen. Its deodorising power accounts for its absence in the air of crowded towns.

PAARDEBERG, a small place on the Modder River, in Orange River Colony, 30 miles south-east of Kimberley. Here Cronje, the Boer leader, surrendered to Lord Roberts, on February 27, 1900, with over 4000 men.

PACIFIC OCEAN, THE, separates America from Asia, and extends southward from Behring Strait, where it narrows to a width of 40 miles, to latitude 40° S. Its greatest breadth is 10,000 miles, greatest depth 5,269 fathoms, average depth 2,500 fathoms, and area 70 million square miles. The largest islands are found along the western shore, and include Japan, Borneo, the Philippines and New Guinea. Vast numbers of small islands of coral or volcanic origin occupy the tropical regions of the eastern half of this ocean.

PACTO'LUS, THE, in ancient geography, was a small stream in Lydia, Asia Minor, tributary to the Hermus. From its mud and sand was extracted much of the gold which made Crœsus, King of Lydia, proverbial for wealth. The river is identical with the modern Sarabat in Anatolia.

PADEREWSKI, IGNACE JAN, *b.* in Poland, 1860; a celebrated pianist. He studied at Warsaw and Berlin, but made his début at Vienna, in 1887. He attributes his success to strenuous and continual practice.

PADUA, a city of Northern Italy, about 25 miles west of Venice. It was of great importance in Roman times and during the Gothic occupation of Italy. Its University, founded in 1238, had a European reputation in the Middle Ages. Silk fabrics are largely manufactured, and its trade in grain, wine and oil is extensive; population 94,000.

PÆAN, in classical mythology, one of the names of Apollo, as the healer and deliverer of man. From the frequent recurrence of the word in hymns to Apollo, the hymns themselves were called *pæans*, whether they were hymns of prayer or praise; but the latter meaning alone remains now.

PAGANINI, NICOLO, *b.* at Genoa, 1784, *d.* 1840, a violinist of marvellous skill. At his first concert in 1793, when only nine years old, he gave proof of remarkable talent, and in later years he developed a wonderful power of execution.

PAGE. In Feudal times, pages were boys of noble birth who were attached to the households of sovereigns, noblemen, or distinguished knights, and there acquired a training in courtesy and arms. Usually they were the personal attendants of the ladies of the household, and on leaving boyhood, became esquires and finally knights. The system died out towards the end of the 15th century, but such pages are still employed on state occasions at many European Courts.

PAGET, SIR JAMES, *b.* at Yarmouth, 1814, *d.* 1899; a great surgeon of the 19th century. He had a hard struggle at first, but eventually got known as the first physiologist and pathologist in England, and perhaps in Europe. The Queen and the Prince of Wales had great reliance on him, and his works on "Surgical Pathology" and kindred subjects established his fame.

PAGODA, a name given to temples in India, China, and south-eastern Asia generally. Their chief characteristic is the enormous height to which they rise, sometimes thirteen stories in pyramidal form resting on the main building.

PAINE, THOMAS, *b.* Norfolk, 1736, *d.* 1809, a plausible writer on social and religious problems. Emigrating to America in 1774, he fought under Washington against England, and by his vigorous writings spurred the colonists to secure their independence. His "Rights of Man," a defence of the French Revolution, and a reply to Burke's famous essay, was produced by him in 1791, while on a visit to England. The pernicious influence of this work forced him to flee to France to escape prosecution. He became a member of the National Convention, but was imprisoned by Robespierre. During confinement, he began his "Age of Reason," a work which alienated many of his friends. Leaving France in 1802, he spent the remainder of his life in America.

PAISLEY, a manufacturing and shipbuilding town of Scotland on the Cart, near its junction with the Clyde, about 7 miles south-west of Glasgow. In the manufacture of cotton-thread Paisley is the principal centre among the industrial cities of the world. Shipbuilding, owing to the widening and deepening of the Cart, is progressing, and vessels up to 9,000 tons are now built there; population 83,000.

PALATINE (Lat. *palatinus*, "belonging to a palace."). The use of the word "palatine," as applied to a count, dates from the Roman Empire, and denoted an officer with special privileges and responsibilities. In England the "counties palatine" were Cheshire, Durham, and Lancashire; the first two by prescription, or immemorial custom, the last-named by creation by Edward III. The Earl of Chester, the Bishop of Durham, and the Duke of Lancashire had full "*jura regalia*" in their respective districts, that is, they exercised royal rights therein. The duchy of Lancaster has still its own Chancellor, in whose name a chancery court is held.

PALE, THE ENGLISH, the name given to that portion of Ireland under the actual government of the English from the nominal conquest of Ireland in 1170 to the completion of the conquest in 1603. The extent of the Pale varied considerably from time to time, according to the relative strength of the English and Irish, but the strip of coast-land between Dublin and Wexford was the part most firmly held by the conquerors.

PALERMO, an important port of north-west Sicily, and the administrative centre of the island. From 1071 to 1860 it was the capital of the Kingdom of Sicily. Silk goods, gloves and straw hats are manufactured, and fruit and agricultural produce exported; population 310,000.

PALESTINE, or the Holy Land, the birthplace of Christ, and the scene of most of the events of Old Testament history, is now the southern portion of Syria, which is itself a part of the Ottoman Empire. Lying between 31° and 33° 21′ N., Palestine is washed on the west by the Mediterranean, and on the east merges into the Syrian desert without any clearly defined boundary. Turkish misrule and the consequent industrial depression have rendered it no longer "a land flowing with milk and honey," but the slow though persistent immigration of steady hard-working Jews in recent years, a better irrigation system, and improved agricultural methods, promise a revival of prosperity. Olive oil, maize, oranges, citrons, and a little cotton are exported. A railway connects the port of Jaffa—the ancient Joppa—with the capital, Jerusalem. Area, about 11,000 square miles; population 700,000, of which 14 per cent. are Jews and 80 per cent. Mohammedans.

Conquered in 332 B.C. by Alexander the Great, Palestine passed on his death to the Ptolemies of Egypt, and later, in 63 B.C., to Rome. An insurrection, 66–70 A.D., was crushed by Titus, who destroyed the temple at Jerusalem. The Saracens obtained possession of it in 636 A.D., the Seljuk Turks in the 11th century, and the Ottoman Turks, by whom it has since been held, in the early part of the 16th century.

PALESTRINA, GIOVANNI, *b.* 1524, *d.* 1594, a well-known Italian composer of sacred music. In 1562 he was engaged to reform the existing music of the Church, which had been severely condemned by the Council of Trent. To this end he wrote several masses, the finest being that of "Pope Marcellus," and by a happy combination of artistic and sacred feeling raised church music to a high level.

PALEY, WILLIAM, *b.* at Peterborough, 1743, *d.* 1805, a celebrated English divine and theological writer. He studied at Cambridge, was Senior Wrangler in 1763, and for many years lectured on Mental and Moral Philosophy. In 1776 he became vicar of Appleby, where he produced his "Evidences of Christianity," a work regarded long as a most conclusive defence of Christianity. His other great works were his "Horæ Paulinæ" and "Natural Theology."

PALI, an ancient dialect of India, current in Northern India when Buddhism arose. The Buddhist sacred books were written in Pali, as well as treatises on general learning, morals, etc. Many copies of these have been obtained in Ceylon, Burma, and Siam.

PALISSY, BERNARD, a famous French potter and scientist of the 16th century. After serving an apprenticeship in glass-work, he travelled through France and Germany, supporting himself by painting on glass and land surveying, and finally settled down with the determination of discovering the secret of enamelling pottery. In this he succeeded in 1557, after sixteen years of patient and expensive experiments, which frequently brought him to the verge of ruin. In 1572 he was called to Paris and appointed to the management of a royal pottery there. Imprisoned in the Bastille in 1585 as a Huguenot, he died there in 1589 at a ripe old age.

PALLADIUM, a great wooden image of Pallas, preserved at Troy, on which it was believed the safety and good fortune of the city depended. It was stolen by Ulysses in the Trojan war. Several ancient cities, including Athens, Argos and Rome claimed to have acquired possession of it. Used metaphorically, the word means a protection; thus, "trial by jury" is said to be the "palladium" of British liberty.

PALLAS, or **ATHENE.** (which see.)

PALLIUM, an ecclesiastical ornament of white wool sent by the Pope to archbishops on their application as a mark of his approval of their appointment, and a

recognition of their authority to consecrate bishops. It takes the form of a narrow band worn round the shoulders, with two strips, also of white wool, depending from it, one down the breast the other down the back. Black crosses are worked into the material. The pallium worn by patriarchs and metropolitans in the Greek Church is a scarf whose ends reach the ground.

PALL MALL, a well-known thoroughfare of London, whose name is derived from *paille-maille*, a game resembling croquet, which was played in grounds adjoining during the Stuart period.

PALM, an order of plants, the species of which figure largely in the vegetation of most tropical countries. The greater proportion of them are distinguished by tall, straight and slender trunks (without branches), crowned by large drooping leaves. Nearly all of them yield products useful to man. Dates, cocoa-nuts, sago, oil, a kind of wine, building timber, materials for thatching, basket and hat-making, and a fibre used in sail and rope making, are a few of the commodities obtained from the many varieties of palms.

PALMAS, LAS, an important port and health resort of the Canary Islands. It stands on the island of Great Canary, has a considerable harbour, and is a coaling station and port of call for the Union-Castle Line. Cochineal and fruit are exported; population 45,000.

PALMER, EDWARD HENRY, *b.* at Cambridge, 1840, *d.* 1882; had a marvellous gift of acquiring languages. His proficiency in Oriental languages brought him a fellowship at Cambridge in 1867, and employment by the Palestine Exploration Fund in 1868-70. During the Egyptian troubles of 1882 he was employed by the British government to conciliate the tribes of the Sinai Peninsula, and here he was murdered.

PALMER, JOHN, *b.* 1742, *d.* 1818; the "Rowland Hill" of the 18th century, was at first a theatrical manager at Bath and Bristol. In 1782 he conceived the idea of the mail-coach, i.e., a coach primarily for the conveyance of letters, though passengers might be taken. From 1784 to 1793 he was the autocrat of the post-office, introducing reforms innumerable; he then received a pension of £3000 a year, to which was afterwards added a grant of £50,000.

PALMER, ROUNDELL. See *Selborne*.

PALMERSTON, VISCOUNT, *b.* 1784, *d.* 1865, a distinguished English statesman. After graduating at Cambridge, he entered Parliament in 1807, and as Secretary for War from 1809 to 1828 made many judicious reforms and showed great business capacity. As Foreign Secretary under Whig Ministers during the periods 1830–4, 1835–41, 1846–51, he made a great name by his vigorous conduct of affairs, especially in safe-guarding the interests of Britons abroad. He succeeded Lord Aberdeen as Prime Minister in 1855, and carried on the war with Russia in the Crimea with renewed vigour and ultimate success. He was chiefly concerned during his parliamentary career with England's foreign relations, and his general policy as Premier was, during his later years, acceptable to the nation in general.

PALMISTRY, the art which claims to tell a person's future and past by studying the lines on the palm of the hand. This art is of great antiquity, and its practice is now chiefly confined to charlatans and gipsies, who still find clients among the credulous and curious.

PALM SUNDAY, the Sunday before Easter, commemorates Christ's triumphal entry into Jerusalem, when palm leaves were strewn in His path.

PALMYRA, the Tadmor of the Bible, is a ruined city lying in a small oasis about 140 miles north-east of Damascus, in the Syrian desert. It was fortified—perhaps founded—by King Solomon, and for many years guarded the northern frontier of the kingdom of Israel against the desert tribes. In 130 A.D. it fell under the suzerainty of Rome. Palmyra reached its highest prosperity under Zenobia, who, in 266, asserted her independence and styled herself "Queen of the East." By this foolish ambition she lost both her kingdom and her liberty. She was defeated and brought to Rome by the Emperor Aurelian, who later, in 273 A.D., reduced the city to its present ruined condition. Palmyra is still a favourite spot for the labours of archæologists.

PAMIR, THE, an extensive table-land in Central Asia, often styled "the roof of the world." It is the most lofty plateau in the world, its average height exceeding 13,000 feet. It lies at the junction of the Himalaya, Thian-shan, Kuen-Lun, and Hindu-Kush systems. In summer, a few wandering Kirghiz seek its scanty pastures for their sheep. Here, in 1895, a boundary was fixed, by agreement between England and Russia, separating the spheres of political influence of the contracting parties.

PAMPAS, THE, extensive treeless plains covered with grass (except during drought) in Argentina, Paraguay and Uruguay, South America. They support various Indian tribes and great herds of wild horses and cattle. These plains are gradually being turned into cattle-ranches; and sheep rearing—especially in Argentina—is increasing rapidly, and is already a profitable industry.

PAN, in Greek mythology, a rural deity, the protector of flocks and herds, wild beasts, fishes and bees. He is represented with the body and head of a man, and with a goat's hind-quarters, horns and beard. His worship spread from Arcadia through the other Greek States, and he was made to figure in the war of the Titans and in a musical contest with Apollo. Sudden fear without assignable reason was attributed to his influence, and hence called *panic*. He was credited with the invention of the syrinx or Pan's pipes.

PAN'AMA, a republic which includes the narrow isthmus of Panama or Darien, between Central and South America. It seceded from Colombia in October, 1903, and was immediately recognised by the United States. Its total length is about 480 miles, and a ridge about 300 feet high runs through it parallel to the coast.

PAN'AMA CANAL, THE. This great undertaking was begun in 1881, under Ferdinand de Lesseps, and after only 12 miles out of 54 had been completed, at the enormous expenditure of about fifty million pounds, abandoned in 1889. The United States in 1902 negotiated unsuccessfully with the government of Colombia for permission to resume the work. The secession of Panama in 1903 has smoothed away all difficulties, and it is expected that the canal, which is to have a depth of 30 feet, will be completed in ten years. Forming a short cut between the Atlantic and Pacific Oceans, it will doubtless become one of the world's great commercial highways.

PANCRAS, SAINT, a Roman youth of noble birth, who at the age of fourteen suffered martyrdom in Britain as a Christian during the Diocletian persecution, about 304 A.D. He has since been regarded as the patron saint of children.

PANDECTS OF JUSTINIAN, a collection of laws—contained in fifty books—drawn from the works of the leading Roman writers on jurisprudence. The work was carried out by order of the Emperor Justinian, in the middle of the 6th century A.D. By an imperial decree these laws were put in force to the annulment of all previously existing laws not included in them.

PANDO'RA, the Eve of Greek mythology, the first woman on earth, was created by Zeus to punish Prometheus for stealing the divine fire from heaven. She was loaded with gifts—hence her name, meaning "All gifts"—by the gods and goddesses, and sent as a wife to Prometheus. Suspecting treachery, he refused her and she wedded his brother Epimetheus. The latter, overcome by curiosity, persuaded her to open a box given her by Zeus, when from it escaped all mortal ills to overspread the earth, hope alone remaining.

PANJANDRUM, THE GRAND, a name invented by the actor-dramatist, Foote, and used by him in a passage of connected nonsense which he set as a test to the actor, Macklin, who was boasting, in company, of his memory. Foote never vouchsafed any information as to the character's antecedents, but the name is occasionally used humorously for imaginary Eastern potentates with vast powers.

PANORAMA, an "all-round view," is the name applied to paintings of extended scenes, which are slowly unrolled and rolled at opposite ends so that some part of the picture is always before the observer. In a *diorama*, the spectator stands in a darkened room and views the pictures through a small aperture. In these, both sides of the material used are painted, and by changing the colour of the light thrown on the picture the paintings blend, and a previously deserted street may be made to appear full of life. The *cyclorama*, which in its appearance of reality surpasses all previous forms of panorama, is a continuous picture painted on the wall of a circular room, and viewed from a platform in the centre. All these panoramic views are disappearing before pictures of the biograph type.

PANTA'GRUEL, the hero of the second of Rabelais' satires. His exploits were on a par with his marvellous origin and infancy. Born when his father Gargantua was over 500 years old, he had to be fastened in his cradle with iron chains. His tongue was large enough to cover an army, and he was master of all earthly knowledge and wisdom.

PANTOGRAPH, a mechanical device for copying exactly the main outlines of drawings on a reduced or enlarged scale. Enlargement by photography has now rendered it practically obsolete.

PANTHEISM. Refer to *Index*.

PANTHE'ON, THE, a name specially applied to a splendid temple in Rome, erected about 25 B.C. by Augustus's famous general, Agrippa, and by him dedicated to all the gods. Early in the 7th century A.D., it was converted by Pope Boniface IV. into a Christian church, and by him dedicated to the Virgin and all the Saints. It is circular in shape, has a fine lofty dome and a noble portico. It is now known as Santa Maria della Rotunda, and considering its antiquity is in an excellent state of preservation. The Panthéon at Paris, whose dome is modelled on that of St. Peter's, Rome, was begun in 1764. It served both as a church and burial place for great Frenchmen till 1885, but is now used solely as a mausoleum.

PANTOMIME, originally a dumb-show actor, then a play acted in dumb-show, and now a theatrical display given usually at Christmas-time, for children and laughter-loving adults. In its present form it consists of two parts; the first, a burlesque of a nursery tale or popular fable, in which amusing songs and dialogues occur; the

second, a harlequinade in which figure the clown, the pantaloon, harlequin and columbine.

PAOLO VERONESE. See *Veronese.*

PAPAL STATES, territories in Italy, varying in extent from time to time, which for nearly 1,000 years were directly under the rule of the Pope. By various bequests, beginning in 755 A.D., and by the voluntary grants of many nobles in Italy, a temporal Papal State grew up, which at length had an area of over 17,000 square miles, with Rome as its centre of government. After the Austro-Italian war of 1859 nearly two-thirds of this area was added to the kingdom of Italy. Rome and its environs, however, were preserved for the Pope by the French until 1870, when their defeat by the Germans led to the withdrawal of their troops from Rome, which then became the seat of government of a united Italy.

PAPER. In the manufacture of this well-known commodity, fibrous substances are used, which, on being reduced to a pulp, still retain innumerable filaments. To meet the enormous demands of the press and commerce generally, over 400 varieties of woods and grasses have been called into requisition, linen and cotton rags being now used only in the manufacture of the very best writing paper. Nearly 200,000 tons of Esparto grass from Spain and North Africa, and over two million pounds worth of wood-pulp—chiefly from Norway and Sweden—are imported annually into England. Paper to the value of 4½ million pounds per year is imported into this country, Holland being the leading source of supply. In paper-making by hand the materials are reduced by machinery to a pulp, which, when ready, is poured into square frames with fine wire bottoms, where the pulp settles in a thin sheet. When sufficient water has drained off, this sheet is removed, pressed between sheets of felt, sized, and, if necessary, glazed. Of the paper now manufactured, about 99 per cent. is machine-made.

PAPIAS, a Christian writer who died about 162 A.D. From the few surviving fragments of his five books on "The Sayings of our Lord," information as to the authorship of the new Testament has been gathered. Among other statements he mentions Saint Mark as writing from Saint Peter's dictation. He is said to have been Bishop of Hierapolis, in Phrygia, but nothing definite is known of his life.

PAPIER-MACHÉ, a hard substance of woody appearance made from white or brown paper, with the addition of other materials to vary the quality. The ingredients are boiled and reduced to a kind of dough, which can be readily moulded, and serves as a good substitute for the softer kinds of wood. The name is also given to layers of coarse paper pasted together to form trays, etc., which are usually ornamented with mother-of-pearl or painted designs.

PAPUA. See *New Guinea.*

PAPYRUS, a kind of rush reaching sometimes to a height of 10 feet, found in marshy districts of Abyssinia, Palestine and Sicily. In Egypt, where it is now rare, it supplied the "hieratica" used for priestly writing. The stems, after the removal of the outer coat, seem to have been sliced longitudinally, woven together by hand, moistened with Nile water to bring out the gum and form a united surface, then pressed flat, dried and finally smoothed. Up to the 10th century A.D. Egypt was the main source of the European paper supply.

PARABLE, the term applied specially to a short tale or story, the incidents in which are intended to suggest a moral or spiritual meaning. The Parable of the Sower, Matt. xiii. 3–8 and 18–23, with its close parallel explanation, is the type and key of this kind of narrative, and the most touching of all parables is that of the Prodigal Son, Luke xv. 11–32.

PARACHUTE, a contrivance attached to a balloon, by means of which the aeronaut may descend in safety from a great height. It is usually made of silk, and when opened out resembles a large umbrella. A hole at the top prevents the formation of a cushion of air during the descent, and thus secures steadiness.

PARADISE, a word of Persian origin, meaning a park. Xenophon, the Greek historian, introduced the word into Europe, and it was employed by the Greek translators of the Old Testament to represent the Garden of Eden. By extension it was applied to any abode of happiness, particularly to that part of Hades in which the saints departed are at rest and in peace. Milton in his great epic, "Paradise Lost," often uses the word in its narrower sense, "the Garden of Eden"; but in "Paradise Regained" the word is used in its highest sense.

PARADOX, literally, that which is "against opinion," is a statement or proposition contrary to commonly received opinion. It also means a statement that seems on the surface contrary to common sense, but in reality is perfectly true, the words being used in a special sense.

PARAFFIN, the name given to a white waxy solid, obtained by distilling coal-tar, wood-tar, but especially crude petroleum. It has neither taste nor smell, and is used largely in the manufacture of candles, and as a lining for metal tanks containing acids, for most of which it has no affinity. The name is also applied to liquid products of the distillation of the above-mentioned substances.

PARAGUAY, (1) a republic of South America, enclosed on all sides by Brazil, Argentina and Bolivia. It produces maize, rice, coffee and tobacco. Extensive forests yield over 60 varieties of timber. *Maté,* a good substitute for tea, consumed largely in South America, is obtained from shrubs which here grow wild. Great herds of cattle yield considerable quantities of hides and tallow, which are exported. Area, 145,000 square miles; population, 636,000. (2) a river of South America, rising in Brazil, in which country lies more than half its course. It flows southward through Paraguay and from Asuncion to its junction with the Parana separates Paraguay from Argentina. It was declared open to the trade of all nations in 1852, and is of great commercial value to Brazil and Paraguay. Length, about 1,600 miles.

PARASITES. (1) In botany the term is used for plants which attach themselves to another plant and nourish themselves upon its juices. This class includes many fungi. The mistletoe grows originally from seed and becomes gradually parasitical. The parasites which produce ring-worm and thrush are examples of vegetable parasites attacking animals. (2) In zoology the term is applied to animals that live on, and at the expense of, other animals. In contrast to this, see *Commensalism.*

PARCÆ, the name for three sisters in Greek mythology, to whom future events were known, and who spun out man's destiny in the form of threads. *Clotho* is represented as working the distaff, *Lachesis* as drawing out the thread, and *Atropos* as waiting with scissors ready to snip it off.

PARIAHS, natives of the lowest class in India, who perform the most menial offices. The name is also applied to ownerless mongrels which infest many eastern cities and act as scavengers.

PARIS, in Homer's "Iliad," was the son of Priam, King of Troy. Prophecy having declared that he would cause the destruction of Troy, he was abandoned, soon after birth, on Mount Ida. He was found and reared by a shepherd, and on growing up proved a valiant defender of shepherds and their flocks. He succeeded in discovering his real origin, and was received by Priam as his son. To Paris was entrusted by Zeus the decision as to which of the three goddesses—Hera, Athena, or Aphrodite—was the fairest. Having decided in favour of Aphrodite (Venus), she assisted him in abducting Helen, the beautiful wife of Menelaus, King of Sparta. The Siege of Troy was the attempt of the Greeks to regain Helen and avenge the wrong to Menelaus. During the fighting Paris died from a wound given by one of the poisoned arrows of Philoctetes.

PARIS, the capital of France and the second city in Europe in point of population, stands on the Seine, about 180 miles from the sea. It occupies both banks of the river, and the Ile de la Cité, an island connected by five bridges with the mainland. Few cities equal it in the beauty of its broad thoroughfares and fine public buildings, and it ranks as one of the great centres of fashion, literature and arts. It has considerable manufactures of clothing, articles of personal and household adornment, watches, clocks, jewellery, and gloves. It is closely bound up with the great historic movements of France, and has suffered many sieges, the chief being that from September, 19, 1870, to January, 28, 1871, when, after undergoing a heavy bombardment and terrible privations, the city surrendered to the Germans; population exceeds 2,700,000.

PARKER, JOSEPH, *b.* 1830, *d.* 1902; a popular and influential Nonconformist minister, began preaching as a youth. After studying at University College, he became a congregational minister at Banbury, whence he migrated to Manchester, and afterwards to the Poultry Chapel, London, which was replaced by the City Temple. Here his originality of thought and striking language attracted large congregations.

PARK, MUNGO, *b.* near Selkirk, 1771, *d.* 1806, an intrepid African traveller. He was by profession a doctor, and led two expeditions with the object of tracing the course of the Niger. In the first, 1795–97, he reached the Niger from Senegal after many hardships, and traced a small part of the course. In the second, 1805, he again reached the river, but of the thirty-eight Europeans who formed the expedition not one returned. His journal, which he had with great forethought sent back to Gambia when dangers thickened, was afterwards published.

PARKER, MATTHEW, *b.* at Norwich, 1504, *d.* 1575, a famous English churchman and writer. Elizabeth, on her accession, made him Archbishop of Canterbury, and this difficult position he filled with great wisdom and discretion for sixteen years. The thirty-nine articles were revised and the Bishop's Bible (a revision of Cranmer's translation) produced under his direction.

PARKMAN, FRANCIS, *b.* at Boston, Massachusetts, 1823, *d.* 1893, a Canadian historian of high reputation. His works include "Pioneers of France in the New World," "The Old Régime in Canada," and "Montcalm and Wolfe." He lived for considerable periods among Indians, studying their life and collecting historical information.

PARLIAMENT. Refer to *Index.*

PARLIAMENT, THE HOUSES OF, a palatial structure at Westminster built in

the Gothic style from the plans of Sir Charles Barry. It was begun in 1840 and finished in 1857. The building occupies 8 acres and has a façade stretching 940 feet along the bank of the Thames. Three towers, one of which is 340 feet high, add to the imposing effect of the palace. Besides the richly decorated House of Lords and the less ornamented House of Commons, there are some 500 apartments within its walls.

PARNASSUS, a mountain 8,000 feet high, in Central Greece, north of the Gulf of Corinth. In Greek mythology it is represented as the abode of the Muses. On its lower slopes was the oracle of Delphi, and near the summit was the Castalian Spring, the drinking of whose waters was reputed to give poetic inspiration.

PARNELL, CHARLES STUART, *b.* in Wicklow, 1846, *d.* 1891, a prominent Irish politician. Entering parliament in 1875 as a Home Ruler, he became the ruling spirit of a system of obstruction to parliamentary business with the object of forcing a recognition of Irish grievances. He was first president of the Land League in 1879, and directed its counsels with consummate skill and sagacity, doing more than any other man to promote the cause of Home Rule. But he alienated his Liberal allies in Parliament by his guilty connection with the O'Shea divorce case.

PARODY, an imitation of a serious poem or prose passage which follows the original in structure and expression, but evokes laughter by the subject chosen and the way in which it is elaborated. A witty and tasteful parody demands ability of no mean order.

PAROLE, specifically, is a promise given by a prisoner of war to his captors. A prisoner released on parole agrees to keep within defined limits and not to attempt to escape; if set at entire liberty he engages to return to his captors if called upon to do so during hostilities, and also to refrain from taking any active part in the war. To break parole is deemed a serious breach of honour by both friend and foe.

PAROS, an island of the Cyclades in the Grecian Archipelago. In ancient times its now deserted quarries supplied the famous Parian marble employed in the construction of sacred buildings, and in the statuary of Greece.

PARQUETRY, flooring composed of rectangular blocks of wood about an inch thick, laid so as to form a geometrical pattern. It is cleaner and more economical in the long run than ordinary flooring, but expensive at the outset.

PARR, OLD, the appellation of Thomas Parr, a native of Shropshire, who died in 1635, at the reputed age of 152. He was buried in Westminster Abbey.

PARROTS, the name of a group of birds very widely distributed throughout the tropical and sub-tropical regions of the earth. The bill is large and powerful, the upper maxilla being much arched and overlapping the lower. The foot has four toes, two directed forwards and two backwards, an arrangement which enables it to cling and climb. Several hundred species exist, the best known being the Gray Parrot of West Africa and the Green Parrot of the Orinoco basin. These birds can imitate the human voice, but it is doubtful if they are capable of reasoning.

PARRY, SIR WILLIAM, *b.* at Bath, 1790, *d.* 1855, a famous Arctic voyager. As an officer of the English navy, he commanded three expeditions to discover the North-West Passage, reaching 113° 46′ W., and discovering Barrow Strait and Melville Island; he also made an unsuccessful attempt to reach the Pole in 1827. The accounts of these voyages are extremely interesting.

PARSEES, a people of Persian origin now confined chiefly to the province of Bombay, India. They are the descendants of Zoroaster's fire-worshipping disciples, who fled from Mohammedan persecution in Persia about 800 A.D. The moral code of Zoroaster is still observed by the Parsees, who number among them many prosperous merchants, and are much respected for their probity and high moral character.

PARSONS, HON. CHAS. ALGERNON, *b.* 1854; the inventor of the marine steam turbine. The *Turbinia*, the first steam turbine vessel, was launched in 1898, and already a revolution in steam propulsion seems at hand. See *Turbine* and *Turbine Engines*.

PAR'THENON, a splendid temple at Athens, begun in 450 B.C., under the direction of the great artist, Phidias, and dedicated to the goddess Athene. Authorities are agreed that in beauty of design and in sculptural and decorative effects the Parthenon has never been equalled. Its present ruinous condition is due partly to the lapse of time, partly to the havoc wrought by a shell fired by the Venetians during a siege in 1687, and more especially to the removal of its ancient pieces of sculpture, some of which, under the name of the Elgin marbles, may be seen in the British Museum.

PARTINGTON, DAME, a lady of Sidmouth, the lower rooms of whose house were flooded by the sea during a severe storm in November, 1824. The dame strove heroically to conquer the flood with a mop. Sydney Smith, speaking on the Reform Bill in 1832, revived the story to illustrate the futility of resistance to the national movement for reform.

PARTRIDGE, a genus of birds common to the temperate regions of the Old World. Two species are found in Britain, the common partridge, distinguished by its short, blunt-tipped bill and the red stripe which takes the place of eyebrow, and the so-called Guernsey partridge, introduced in recent times from France, and distinguished by its red legs. The flesh, especially that of the common partridge, is much esteemed, but in England these birds are reared in large numbers chiefly for the sport they afford.

PASCAL, BLAISE, *b.* 1623, *d.* 1662, a famous French mathematician and philosopher. At the age of seventeen he produced his "Treatise on Conic Sections," a work of great originality and genius. From 1655 to his death he lived an ascetic life and identified himself with the Port-Royalists. His "Pensées," containing reflections on life and religion, have a great reputation in France.

PAS-DE-CALAIS, the French name for the Strait of Dover.

PASQUINADE, a lampoon, so called from a mutilated statue in Rome, on which, until quite recently, lampoons were often pasted. This statue had been dug up in the 15th century opposite the shop of a witty Roman barber, and by popular consent his name, *Pasquin*, was applied to it and afterwards retained.

PASSION-PLAY. See *Ober-Ammergau*.

PASSMORE-EDWARDS. See *Edwards, Passmore*.

PASSOVER, a great Jewish festival which commemorates the exodus of the Israelites from Egypt. It is held on the evening of the 14th day of Abib, or Nisan, the first month of the ecclesiastical year.

PASSPORT. See *Commercial Dictionary*.

PASTEL, a kind of coloured crayon made of ground pipe-clay, very thin gum-water, and the required colour, and used to execute drawings on paper or parchment. It is a favourite material for executing hasty portraits with, and is used with fair success for landscapes. The drawings themselves are often called pastels.

PASTEUR, LOUIS, *b.* 1822, *d.* 1895, a famous French chemist and pathologist. His research work in organic chemistry led to his appointment as professor of chemistry at the Sorbonne in 1867. His studies of the fermentation of liquids, his successful inoculation of fowls against cholera and of cattle against anthrax, brought him great fame; he also discovered a method of inoculation with the virus of rabid animals as a cure for hydrophobia in man. From 1886 to his death he worked mainly at the Pasteur Institute in Paris.

PASTILLE, a paste or mixture whose foundation is powdered charcoal, containing aromatic substances, as benzoin, sandal-wood, etc. It is formed into little cones which, when dried, are lit at the apex and burn with an agreeable odour. The name is also given to aromatic lozenges.

PASTON LETTERS, a collection of letters written and received by members of the Paston family of Norfolk during the latter half of the 15th century. They have proved a valuable source of information on the social and political history of the period.

PATAGONIA, an extensive territory occupying the extreme south of South America. Since 1881 it has been divided between Argentina and Chile, the line of division being approximately the chain of the Andes. The surface of Eastern Patagonia consists generally of boulder-strewn plains, covered sparsely with coarse grass, which support the guanaco, the rhea and a species of deer. The natives, numbering about 20,000, are tall—varying from 5 ft. 10 in. to 6 ft. 4 in.—and well proportioned. They are expert horsemen and live chiefly by hunting. Western Patagonia is extremely damp and contains much timber. The fossil remains of the whole region are highly interesting, and are now under investigation; area 322,250 square miles.

PATEN, a shallow circular dish to hold the consecrated bread or wafers in the Eucharistic service. In ancient times it was of wood or glass; later always of gold, silver, or fine bronze. Some of the mediæval patens are richly chased and ornamented with gems.

PATENTS. Refer to *Index*.

PATERSON, WILLIAM, *b.* 1665, *d.* 1719, a famous Scotch financier. He was one of the first directors of the Bank of England, which institution was founded chiefly by his labours. In 1695 he embarked on a scheme for colonising the isthmus of Darien with Scottish settlers. The disastrous failure of the movement caused widespread ruin amongst Scottish speculators. He received a pension from government in George I.'s reign to compensate him for his losses.

PATMORE, COVENTRY, *b.* 1823, *d.* 1896; one of the most important of the poets of second rank in the 19th century. An assistant librarian at the British Museum, he had much leisure for writing. "Tamerton Church Tower," "The Angel in the House," and the "Unknown Eros," are his best known works.

PATMOS, a small mountainous island belonging to Turkey, in the Grecian Archipelago. Here, according to tradition, St. John the Apostle lived in exile about 94 A.D., and saw the visions set down in the Book of Revelation.

PATNA, a city of Bengal, India, stretching for 9 miles along the right bank of the Ganges. It is the centre of a rich agricultural

district. Here the produce of the poppy is prepared as opium, and sent to Calcutta for exportation to China; population 135,000.

PATON, SIR NOEL, *b.* at Dunfermline, 1821, *d.* 1901, a British painter well known for his tasteful and charming treatment of allegorical, religious and legendary subjects. His pictures include "The Pursuit of Pleasure," "Mors Janua Vitæ," and "The Man of Sorrows." He also won fame by his sculpture and poetry.

PATRICIANS, the descendants of the Roman "patres," or "fathers" who founded the city. For long the patricians usurped all powers and privileges in the state, but at length the "plebs," or commons, forced the patricians to admit them to at least a share in political power. The internal history of Rome is mainly the story of the struggle between patricians and plebeians.

PATRICK, SAINT, the patron saint of Ireland. The events of his life are lost in legend. He is said to have been born near Dumbarton in 373, and to have died near Downpatrick in 493. He was consecrated Bishop by Pope Celestine, and sent to evangelise the Irish. Saint Patrick's Day is the 17th March, the anniversary of his death.

PATROCLUS, the kinsman and great friend of Achilles, accompanied the latter to the Trojan War. When Achilles remained inactive in his tent, nursing his anger against Agamemnon, Patroclus borrowed his armour, and rallied the despairing Greeks, but he was slain by Hector. The news of his friend's death roused Achilles again to action, and he soon avenged his death on Hector.

PATRON, a protector or guardian. In early Roman times, when the people were divided into patricians and plebeians, and all political and judicial power lay with the former, every plebeian found it wise to profess attachment to, and beg the protection of a patrician. Thus a patrician, as *patron*, would have many plebeians attached to him, who were called his *clients*, and so the use of the word patron to express one who guards in any way, and of client as one who is guarded, has continued.

PATTESON, JOHN COLERIDGE, *b.* 1827, *d.* 1871; was admitted to Holy Orders after a distinguished career at Oxford. In 1855 he sailed with Bishop Selwyn for the South Seas, and in 1861 was consecrated Bishop of Melanesia. He spent a life of devoted work among the natives, by whom he was much beloved, but he was murdered on one of the Santa Cruz Islands in revenge, it is thought, for the misdeeds of certain white kidnappers.

PATTI, ADELINA, Baroness Cederström, *b.* at Madrid, 1843, of Italian parents; a great prima-donna, was trained in America, and made her début in New York in 1859, taking the world by storm. She possesses an unusually high, clear, rich, flexible voice, and is equally successful in rendering the most difficult opera music and the simplest ballad.

PATTISON, DOROTHY WINDLOW, *b.* at Hauxwell, Yorkshire, 1832, *d.* 1878; a sister of Mark Pattison, known as "Sister Dora," a noble woman who spent her life, from 1865, as a hospital nurse at Walsall, where a monument, erected to her memory by the working men of that town, is a witness of her devoted labours and of the devotion of the rough men and women for whom she spent her strength and exercised her skill.

PATTISON, MARK, *b.* at Hornby, Yorkshire, 1813, *d.* 1884; a distinguished scholar. He became a fellow of Lincoln College, Oxford, 1839, and rector, 1861. His essays, sermons, and other literary works were marked by original thought and great earnestness.

PAUL, THE APOSTLE. Few characters in Holy Writ are so well known to us as Saint Paul. The story of his travels alone, when we take into account the circumstances of the time, shows how deep must have been the convictions that bore him onward. Asia Minor, Macedonia and Greece were the chief fields of his missionary labours, but Rome was the goal of his zealous work for Christ. Thirteen of his Epistles are extant and form part of the New Testament. That he was imprisoned in Rome a second time in the year 66 A.D. seems pretty certain, but whether he suffered martyrdom there or not is really unknown.

PAWNBROKER. Refer to *Index*.

PAXTON, SIR JOSEPH, *b.* 1803, *d.* 1865, a famous horticulturist, who rose from a very humble origin. Beginning as a working gardener, he obtained employment in the grounds of the Royal Horticultural Society at Chiswick. He then entered the Duke of Devonshire's service, for whom he entirely replanned the lovely grounds at Chatsworth. His suggestion of a building of glass and iron for the Exhibition of 1851, and the admirable way he carried it out, set the seal on his fame, and procured him the honour of knighthood.

PEABODY, GEORGE, *b.* 1795, *d.* 1869, an American merchant who devoted himself to benefiting mankind by means of his wealth in his lifetime. Besides large benefactions in the United States, he gave altogether no less a sum than £500,000 to be used in the erection of modern dwellings for the poor of London, to be let at moderate rentals. Queen Victoria wished to make him a baronet, but he declined the honour. The "Peabody Buildings" are a well-known feature in many parts of London.

PEACOCK, a kind of game-bird whose native home is India, but which has long been domesticated in most European countries. In India, large flocks of peacocks are common in the lowlands, and afford good sport. The beauty of the male early made the possession of these birds an object of desire, and we read that Solomon's ships brought him peacocks. The bird was not known much in Europe till after the campaigns of Alexander. The Romans accounted its flesh a dainty, and it continued to be served up at banquets through the Middle Ages.

PEAK, THE, a district in the north-west of Derbyshire, generally considered as the end of the Pennine chain of mountains or hills which extend southward from the Cheviots. It is a wild and rugged region, abounding in abrupt hills and natural caves in the limestone. The Peak Cavern, near Castleton, is the most famous cavern, but several more are well worth a visit. Above Castleton is Peveril Castle, the scene of Scott's well-known novel.

PEARL, a round body found inside the shells of many marine animals. A particle of some foreign substance having found its way inside the shell, the inhabitant forthwith surrounds it with a layer of the lustrous and smooth material which lines the shell. The longer this process goes on, of course, the larger the pearl produced. The largest pearl known is two inches long and four round, and is said to be worth £50,000. The best pearls are produced by oysters, but those from mussels are also valuable. The most valuable pearl fishery is that of Ceylon; others are in the Persian Gulf, among the Sulu Islands and off New Guinea. False pearls are made by blowing a thin globe of glass and filling it with a solution of ammonia and fish scales. Mother-of-pearl, or nacre, is the inner coating of shells. It is largely used for making buttons, fans, and little boxes, and for inlaying.

PEARSON, CYRIL ARTHUR, *b.* in 1866, the founder of a series of periodicals, magazines, and newspapers that have an enormous circulation. He received his business education in the "Newnes" office as sub-editor of *Tit-Bits*. On leaving Newnes he started *Pearson's Weekly;* in 1900 launched the *Daily Express*, and in 1905 bought the *Standard*.

PEARSON, JOHN LOUGHBOROUGH, *b.* 1817, *d.* 1897; a distinguished ecclesiastical architect, received his technical training in London. He designed Truro Cathedral, and was entrusted with the restoration of many other cathedrals, including Lincoln, Peterboro' and Canterbury, besides that of the north transept of Westminster Abbey. His domestic architecture was also highly approved.

PEARY, ROBERT EDWIN, a distinguished American engineer and explorer, was born in Pennsylvania in 1856. Entering the U.S. navy in 1881, he soon gained notice for the thoroughness of his work. He has taken part in three Arctic expeditions, in which he demonstrated that Greenland is an island, having its most northerly point in latitude 84°. 17′. The observations he made are of a most valuable nature, and the works in which he makes them known very readable.

PEAT, vegetable substances partly decomposed, and more or less compressed. It is formed always in moist situations, where the roots of mosses and other moisture-loving plants begin to decay, while the uppermost part throws up fresh shoots, so that what was once only a shallow pool becomes a bog many feet thick. Peat-bogs are found in many parts of England, are more common in Scotland, and still more numerous in Ireland. Various efforts have been made to compress peat, and so make it *commercially* available as fuel, but no satisfactory system has yet been produced. It is, however, used as fuel by the peasants. Chat Moss, in Lancashire, and the Bog of Allen, in the centre of Ireland, are well known.

PE-CHI-LI, GULF OF, a branch of the Yellow Sea, off the north of China, about 150 miles wide. It is silting up through the great mass of earth brought down by the Hoang-Ho. Niu-Chwang, the chief port of Manchuria, is near its northern corner. It is entered by the Strait of Pe-chi-li, on the northern side of which is Port Arthur, and on the southern, Wei-hai-Wei.

PECULIAR PEOPLE, a sect of Christians who refuse to avail themselves of the services of a doctor in cases of disease, relying on the injunction given by Saint James about prayer and the laying on of the elder's hands. They have their own form of service and ministers, and believe that they are the one true Church of Christ. They are mostly of the poorer class, and their number is not great.

PEDOMETER, an instrument for measuring distances walked. It is sometimes worked by the movement of a heavy pendulum, which falls when it is shaken by the foot striking the ground, and is restored to its place by a spring, which may be attached to the foot. But in all cases it simply records the number of steps taken, without regard to the length of the steps.

PEEL, SIR ROBERT, *b.* 1788, *d.* 1850, a great statesman of Queen Victoria's reign, was the son of the Sir Robert Peel who did so much for the cotton manufacture. Educated for a political life at Harrow and Oxford, he entered parliament

in 1809, and soon proved the greatness of his ability. Bred a Tory, he repeatedly was forced by his convictions to help on progressive measures which he had long resisted, and thus the name of "turncoat," so freely applied to him, had some show of justification. The passage of the "Catholic Emancipation Bill" in 1829 damaged him in the eyes of the more bigoted Tories, and the repeal of the Corn Laws in 1846 made the majority of his party absolutely irreconcilable. From that time there was no room for Peel in the Tory ranks, and he passed the rest of his political life in independent support of the Liberal Government. His earlier services in reducing and simplifying the import duties on many articles should not be forgotten. To him belongs, too, the credit of re-organising the London police, and introducing the present splendid system; hence the names of "Peeler" and "Bobby" were applied to policemen. The income-tax was also first imposed by him. His death was due to an accident; while he was riding near Hyde Park his horse stumbled and threw him, and then fell heavily on him, inflicting internal injuries from which he never recovered.

PEEP O'DAY BOYS, lawless bands of Ulster Presbyterians who, between 1780 and 1795, used to prowl about at daybreak, searching the houses of their Catholic enemies for arms and plunder. They became merged later in the various societies of "Orangemen."

PEG'ASUS, in Greek mythology, the winged horse which sprang from the blood of the Gorgon Medusa when Perseus slew her. When Bellerophon was preparing to combat the Chimæra, the goddess Athene showed him how to catch Pegasus, by whose aid he overcame that fire-breathing monster. Afterwards, Bellerophon tried to make his way to heaven upon Pegasus, but in mid-air the steed shook him off, and continued its way alone.

PEI-HO, a river of Northern China, having Pekin and Tien-tsin on its banks. It rises near the great Wall and the Mongolian border, and flows in a general south-easterly direction into the Gulf of Pe-chi-li. Near its mouth are the celebrated Taku forts, by means of which the Chinese thought in 1860 to prevent the approach of the "barbarians" to their sacred city of Peking. Length about 350 miles.

PEKING, the capital of China, is situated on the Peiho, about 80 miles in a straight line from the sea. It is one of the ancient cities of the world, its history going back to the 12th century B.C. As the traveller from Tien-Tsin approaches, suddenly a wall 30 feet high, with towers a hundred feet in height, bursts upon his gaze. At the bottom of these towers are the gateways, passing which he enters the outer or Chinese city. The inner or Manchu city, which lies not inside but to the north of the Chinese city, is surrounded by a wall 50 feet in height, with similar towers and gateways. In the heart of the Manchu city is the "Forbidden City," which is really the Imperial Palace with its grounds, and which was occupied by the Allies in 1900. Peking has no manufactures of importance. It is joined to Tien-Tsin by a railway opened in 1897. The sanitary arrangements of the city are of the crudest description. The population is probably under a million.

PELAGIUS, a celebrated British monk who settled in Rome about the year 400, and attracted attention by denying the doctrine of original sin. He maintained that each infant born into the world was born in a state of innocence and his perseverance in virtue depended on himself. For twenty years the conflict raged, until Pope Zosimus definitely declared against the Pelagian doctrines. Pelagius was then banished from Rome, and subsequently from Jerusalem. His fate is unknown.

PELÉE, MONT. See *Martinique.*

PELICAN, a common aquatic bird, haunting the shores of seas, lakes, and rivers. Pelicans are as large as swans, with a capacious pouch of naked skin under the bill, which is terminated by a red hook. As they feed their young from this pouch with their red-tipped beak, the story arose that they fed them with their own blood.

PELOPONNESIAN WAR, a struggle between Athens and Sparta for supremacy in Greece. Pericles, the Athenian leader, had long seen the struggle coming and prepared for it. As long as he lived the Athenians held their own, but after his death, in 429 B.C., the Athenians engaged in rash undertakings, which exhausted their resources, and for a time they fell under the dominion of Sparta. The war lasted, with intervals, from 436 to 405 B.C., and its ultimate result was to lay Greece at the feet of Philip of Macedon.

PELOPONNE'SUS, the ancient name for the southern part of Greece. It included the Athenian State of Achaia, the Spartan State of Laconia, besides Elis, Arcadia, and Messenia.

PEMMICAN, the lean of venison cut into thin slices and dried in the sun, then pounded and squeezed into cakes. This was the method of preserving meat adopted by the North American Indians. For Arctic explorations a similar preparation of beef is made in the naval victualling yards, and mixed with its own weight of the purest melted fat or dried fruit, and put up in airtight bags.

PENANCE, a punishment either imposed by another or self-inflicted as an outward expression of sorrow for sin. The use of public penance has much declined; no one expects now-a-days to see a king, like Henry II., kneeling at the tomb of an Archbishop. In the Roman Catholic Church, penance is still imposed by the priest at confession, its severity being proportioned to the supposed greatness of the sin. In the Protestant Church penance is not officially recognised, although there are instances of confession of sin publicly made, followed by the performance of penance prescribed by a priest.

PENANG, or Prince of Wales Island, at the northern entrance of the Straits of Malacca, and near the Malay Peninsula, has an area of about 106 square miles. It is connected for Governmental purposes with Wellesley Province, on the opposite mainland. The climate is hot, but healthy, sea breezes abounding. Penang is the centre for the trade of the whole Malay Peninsula, the total year's trade amounting, imports and exports together, to about £30,000,000. Tin, pepper, rice and sugar are the chief exports; manufactured goods the chief imports. Georgetown, the capital, has a population of about 130,000.

PENA'TES (a-tes), the household or domestic gods of the Romans, both those belonging to the family and to the State. Jupiter and Juno, as the guardians of peace and happiness, and Vesta, as the guardian of domestic union and comfort, were the chief Penates. The state Penates were said to have been brought from Troy by Æneas.

PENCILS. The name pencil is generally understood to mean a pointed instrument for drawing or writing without ink, but artists also use the name to denote a fine brush for laying on colour. The ordinary lead pencil consists of a thin stick of graphite or plumbago encased in wood. The graphite is ground to a fine powder and mixed with more or less clay, according as the pencils are desired to be more or less black. The whole is then made with water into a thick paste, or dough, and then squeezed through holes of the desired size. The wooden case is made of Florida or Virginian cedar, this wood being so straight grained and easily cut. Coloured pencils are made in a similar way, with coloured chalk instead of graphite.

PENDA, a king of Mercia from about 630 to 655 A.D. He was bitterly opposed to Christianity, and gave its champions no peace during his long reign. At different times he met and defeated nearly all the other Saxon kings, slaying Edwin and Oswald of Northumbria in battle, as well as Anna of East Anglia, but he was himself at last defeated and slain by Oswi, king of Northumbria, 655.

PENDULUM, a small heavy weight suspended by a slight thread or wire so as to be free to swing from side to side. The theoretical pendulum would swing for ever, and a close approximation may be made to this with a very fine thread and a leaden or golden bullet. A pendulum 39·144 inches long beats seconds at London. A shorter one beats faster, and a longer one more slowly; hence in regulating a clock, shorten the pendulum to make it go faster, and *vice versa.* If the suspending string or wire kept always the same length, the clock would go regularly, but in summer an ordinary pendulum wire lengthens, making the clock go more slowly, and in winter it shortens, and makes the clock go faster. Hence the use of "compensating" pendulums, which do away to a certain extent with this variation. The uses of the pendulum to ascertain the force of gravity at different places, to prove the rotation of the earth, and to establish its density, can only be mentioned here.

PENEL'OPE (o-pe), in Grecian legend, the wife of Ulysses. Through his long absence at Troy, and in his after wanderings, Ulysses was regarded as dead, and numerous suitors came to claim Penelope's hand. Her steadfastness in rejecting them, and the arts she had recourse to in order to defer an answer, make a very interesting story, and we rejoice when her constancy is rewarded by her husband's return.

PENINSULAR WAR, that part of the long European struggle against Napoleon, which was waged in the Peninsula of Spain and Portugal, 1808 to 1813. Napoleon, having placed his brother Joseph on the Spanish throne, found that he had thrust his hand into a hornet's nest. England saw her opportunity of hampering him, and devoted her attention to keeping the Spanish resistance alive. The English met with no brilliant successes till towards the end of the period, but she achieved her end. One French army after another marched into the Peninsula and returned to France shorn of half its numbers without strengthening the French position there one jot. On the English side, Sir John Moore at Corunna (1809), and Wellington at Vimiera (1808), Talavera (1809), Albuera (1811), Salamanca (1812), and Vittoria (1813), gained great renown. The masterly way in which Wellington hustled the French across the Pyrenees at the end was a splendid exhibition of tactical skill. The successful storming of Badajoz and Ciudad Rodrigo in 1812 by the British troops is famous in our military annals.

PENITENTIAL PSALMS. Psalms vi., xxxii., xxxviii., li., cii., cxxx., and cxliii. So called because they express sorrow for

sin committed, they also express the writers' sense of the goodness of God in pardoning sin, and of the certainty that a real penitent may feel of being ultimately forgiven. The one most commonly used is the fifty-first.

PENNANT, THOMAS, *b.* near Holywell, Flintshire, naturalist and traveller, who did much to make Britons acquainted with their own country. He visited Cornwall in 1746, Ireland in 1754, and Scotland in 1769 and 1772. "Scotland was then," he truly says, "almost as unknown as Kamchatka." He also rambled through Wales and published his observations in two volumes. But to-day he is chiefly remembered by his "Tours in Scotland" (3 vols. 1771–75).

PENN, WILLIAM, *b.* 1644, *d.* 1718, the founder of the colony of Pennsylvania, and a strict "Quaker," was the son of an English admiral. No one was so grieved and mortified as his father when Penn, then a student at Oxford, became a disciple and follower of George Fox. But no paternal severity could cool the young man's enthusiasm (for several times Penn was imprisoned and fined), and his father at last resolved to endure what he could not cure. In 1681, in return for some claims his father had had against the Crown, Penn obtained a grant of land in North America, where he founded his celebrated colony of Pennsylvania. The favour he enjoyed under James II. rendered him an object of suspicion in the reign of William, but no treasonable act was ever proved against him.

PENNSYLVANIA, one of the original thirteen States which revolted from England in 1776, was founded by William Penn. The story of his going over and founding this State, and of the treaty he made with the Indians, is one of the most interesting in history. Such was the hold that Penn gained on their affections that the whites in Pennsylvania were undisturbed for fifty years. Having an area of 45,000 square miles, or half as big again as Scotland, Pennsylvania is one of the most favoured districts in the world. Its soil is fertile, its climate favourable, and its mineral products abundant. Coal, iron, petroleum, and natural gas are widely distributed, and Pittsburg (population 650,000), the leading manufacturing town, reaps full advantage thereof. Philadelphia, the capital, on the Delaware river, is surrounded by a rich agricultural country, and is conspicuous for its fine public buildings; population 1,300,000.

PENNY POST, THE, was established in England, 1840, mainly owing to the efforts of Rowland Hill. Previous to that date letters had been charged for according to the distance carried; thus the charge for 300 miles for a single sheet was one shilling, double sheets being treated as two letters. This was, in 1840, reduced to a uniform charge of one penny for a maximum weight of half-an-ounce. Refer to "Post Office" in *Index*.

PENNY WEDDINGS, a form of wedding once common in Scotland, where each guest contributed a small sum, usually not exceeding a shilling, to defray the cost of the entertainment, and leave a small balance to enable the young pair to set up housekeeping. Scott mentions the practice in the "Fortunes of Nigel."

PENS. The ancestor of our modern pen is the reed pen of the Egyptians and other ancient nations, specimens of which still exist. The Chinese and Japanese write with a small brush. Quill pens were known as early as the 7th century. Steel pens were in use in the 18th century, but only became common in the 19th. The ordinary steel pen has to go through some sixteen processes before the steel, of which it is formed, is ready for use in writing. Birmingham is the great manufacturing town for pens, and turns them out at the rate of three or four millions a day.

PENTATEUCH ("five books,") is the name under which the first five books of the Bible are often grouped together. They are named Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. The Hebrew title, signifying "five-fifths of the Law" shows the importance of the Pentateuch in the eyes of a Jew. It relates the formation and history of the Hebrew nation up to their invasion of Canaan, and contains the Mosaic laws and their development.

PENTECOST, "fiftieth," is the name given by the Jews to a feast held on the fiftieth day after the Feast of the Passover. Coinciding as it did with the day on which the Holy Ghost descended on the Apostles assembled in Jerusalem, this Jewish festival corresponds with that of Whitsuntide in the Christian Church.

PENZANCE, an interesting town in the west of Cornwall, on Mount's Bay. It has a very mild climate, and the scenery around is picturesque. The mackerel and pilchard fisheries are valuable, and market-gardening is an important industry; population 13,000.

PEPPER, the dried berry of a plant growing freely in tropical countries. The flower is in the form of a spike, and when the berries are fully grown, as soon as they show signs of turning red, the spike is picked and placed to dry. When dry, the berries are rubbed off by hand and form Black Pepper. To get White Pepper, the dried berries are soaked, and the skin and fleshy part removed, the seed alone remaining.

PEPYS, SAMUEL, *b.* 1632, *d.* 1703, secretary to the Admiralty in the reigns of Charles II. and James II., was educated at St. Paul's School and at Cambridge. His kinsman, the Earl of Sandwich, gave him a helping hand, and he soon found employment as clerk in the Admiralty. He took a great interest in the fashionable London life of his day, and wrote in shorthand a most quaint diary recording his daily experiences. This diary, deciphered at Cambridge, was published by Lord Braybrook in 1825. Pepys was the only Admiralty official who remained at his post through the Great Plague, and his account of this calamity is supremely interesting. The diary treats of the ten years, 1659–69.

PERCY, HENRY (HOTSPUR), was the son of the Earl of Northumberland, who lived in the reigns of Edward III., Richard II., and Henry IV. Hotspur gained great renown in the border fighting against the Scots, although he was defeated by Douglas at the fight of Otterburn (Chevy Chase). When the Earl revolted against Henry IV., Hotspur sided with his father, and was slain in the battle of Shrewsbury (1403).

PERFUMES. The use of perfumes is as old as civilisation itself. The ancient Assyrians and Persians are known to have favoured them, and their use among the Greeks and Romans amounted to a passion. There are three chief kinds of perfumes:—(1) those of a resinous nature, as camphor, myrrh, etc.; (2) those derived from the leaves, flowers, or wood of plants; and (3) those of animal origin, as musk and civet. From these sources are obtained about eighteen chief perfumes, and the rest are compounds of these in varying proportions. Many perfumes are now-a-days prepared chemically from spirit.

PERICLES, the great statesman of Athens, and one of the greatest the world has ever seen, lived from about 494 to 429 B.C. During his administration Athens rose to the pinnacle of her glory. He adorned the city with such buildings as the Parthenon, Erechtheum, etc.

PERIPATETICS, the disciples and followers of Aristotle, the great Greek philosopher (384–322 B.C.). They were so called from his habit of walking up and down (Gr. *peripateo*) as he held his discourses. (See *Aristotle.*)

PERKIN, WILLIAM HENRY, *b.* in London, 1838, a celebrated chemist who at the age of eighteen discovered a mauve dye formed by the oxidation of aniline. Sir William Perkin is thus the founder of the industry of aniline or coal-tar colours.

PERPETUA, SAINT, a celebrated African martyr, who was put to death at Carthage in 203. The narrative of her martyrdom bears the impress of truth. The greatest trial of her constancy was caused by the entreaties of her heathen father, who appeared in court with Perpetua's infant in his arms, and tried to prevail on her to deny Christ for the sake of himself and her babe. The gladiator who was to kill her was an inexperienced youth, and misdirected his sword, which she with her own hand guided to a mortal part.

PERPETUAL MOTION. As long as friction and gravity exist, so long, as far as present scientific knowledge goes, will the search for "perpetual motion" be vain. Any machine, however constructed, must be subject to friction in some of its parts, and to the attractive influence of gravity in all, so that a constant drag is always acting on its movements. But even now men go on seeking the impossible in this branch of research, just as years ago men spent their time in seeking an "elixir of life," and the means of turning the baser metals into gold.

PERSEPHONE. See *Proserpina.*

PERSEUS, in Greek mythology, son of Zeus and Danaë, and grandson of Acrisius, king of Argos. An oracle had told Acrisius that he was doomed to perish by a son of Danaë, and Perseus was accordingly banished from Argos. After numerous adventures, including the slaying of the Gorgon, Medusa, he went to visit his grandfather, but on the way accidentally slew the latter, and thus fulfilled the oracle that had preceded his birth. Finally he became king of Tiryns, and founded Mycenae.

PERSIA, or Iran, as its inhabitants call it, is a large kingdom in the south-west of Asia. Its openness to Russia on the north, and its neighbourhood to Afghanistan on the east, render Persia an object of special interest to Englishmen. Of its area of 650,000 square miles, a large part is barren and another large part neglected. Where, however, systematic cultivation does exist, the natural fertility gives a rich reward; wheat, barley, cotton, sugar and rice grow well; silk could be produced in great abundance, and the wines of Persia were once famous. Manufactures are almost non-existent. The products of the country are exchanged against such trifling manufactured goods as the average Persian requires, chiefly through caravans. The principal towns are Teheran, the capital; Ispahan, the ancient capital; and Tabriz. Bushire, the only important port, is on the Persian Gulf. At one time (about 500 B.C.) Persia swayed all western Asia, and appeared about to conquer Europe. Under Cyrus, about 537 B.C., the Persians made themselves masters of the Median and Babylonian Empires, and then proceeded to the conquest of Asia Minor. This brought them into hostility with the Greeks, and the result was the futile attempt of Darius in 490 B.C., and of Xerxes, a few years later, to conquer Greece. The modern history of Persia

comprises her struggles with Russia and England. The oft-repeated conflict with Russia has cost her a large slice of territory in the north-west, but England has consistently tried to preserve the integrity of Persia while maintaining her own rights.

PERSPECTIVE, the art of representing objects on a plane surface. It is divided into Linear Perspective and Aerial Perspective. Linear Perspective may be reduced to geometrical rules, so that in our drawing we can make the straight lines appear just as they do when we gaze at the original, the horizontal lines running up or down according as they are below or above our eye, and the perpendicular ones getting less and less as the distance increases. Aerial Perspective is the art of adding to a picture the required lights and shades and the gradations of colour according to distance and condition of the air.

PERTH, (1) a city of Scotland finely situated on the river Tay, just above where it expands into the Firth. Its importance has diminished of late years, as the traffic to north-east Scotland goes now by the Tay Bridge, but its dyeing and bleaching works are still noted; population 33,000. Perth has been associated with most of the important historical events of Scottish History. Two miles from it was Scone Abbey, where the Scottish kings were crowned. (2) the capital of West Australia, on the Swan River, about 12 miles from the sea. Fremantle, its port, at the mouth of the river, is connected with it by a good road, and there is also railway and water communication. The climate is rather warm, the temperature never going down to freezing point; population 35,000.

PERU, one of the western republics of South America, stretches between Ecuador on the north and Chile on the south, and extends inland to Bolivia and Brazil. Its boundaries are ill-defined, and difficulties are therefore constantly arising with its neighbours. The region between the sea and the Andes, never more than 100 miles wide, is a sandy desert with here and there a smiling river valley. The mountainous portion of the country has massive mountain-chains, with large plateaus and fertile valleys interspersed. Eastern Peru contains the wooded valleys of the upper Amazon and its tributaries. Lake Titicaca lies partly in Peru and partly in Bolivia. Gold is extensively found in the river valleys, but its production is left to the Indians and their primitive methods. The silver industry is more developed, and large quantities are produced. Other minerals are abundant, but found in places difficult of access. The chief vegetable productions exported are cinchona bark, the source of quinine; coca leaves, tobacco and cotton. Of the population of Peru, estimated at 4,600,000, perhaps one-fourth are whites, a half native Indians, and the rest chiefly of mixed race. Lima, the capital (population 105,000), is situated 6 miles inland from Callao, its port (population 48,000). The story of the conquest of Peru by Pizarro, in 1532, is most interesting (see *Pizarro*).

PERUVIAN BARK. See *Cinchona*.

PESHAW'AR, an important military centre of the Punjab, near the mouth of the Khyber Pass. It thus dominates the shortest route between Afghanistan and India, so its importance both in peace and war is great. The cantonments, two miles from the city, always contain a strong force; population 95,000.

PESTALOZZI, JOHANN HEINRICH, *b.* 1746, *d.* 1827, was a native of Zurich, in Switzerland. He benefited mankind by pointing out the true method of education, but died almost a pauper through inability to manage the practical affairs of life. His novel, "Leonard and Gertrude," followed later by "How Gertrude Educates her Children," contain the gist of his teaching, although he wrote numerous other works on the same theme. The keynote of his preaching was that we should base all educational processes on the active exercise of the child's senses and mental powers, rather than cram him with facts, the value of which he has no means of estimating.

PESTER LLOYD, the leading newspaper of Hungary, is published at Buda-Pest, whence its name. Its political articles are highly esteemed for their fairness and insight, and are often quoted by those who value honest and intelligent opinion.

PETARD, a contrivance for blowing up gates of a fortress, etc. It consisted of a hollow case filled with about a dozen pounds of gunpowder, and provided with a slow match, which having been lit, was left to do its work.

PETER, SAINT, one of the most prominent of our Lord's apostles, and after His ascension one of the chief actors in the doings of the early Church. He was the first to admit Gentiles into the Christian Church in the person of Cornelius. He was imprisoned in Jerusalem by Herod Agrippa, in 44 A.D. Later he went to Antioch, where he had a dispute with Saint Paul respecting the terms on which the Gentiles should be received into the Church (Gal. ii. 11–21). Two epistles are usually attributed to Saint Peter, but there has always been some uncertainty as to whether the second epistle was really from his pen. According to tradition, he founded the Church at Rome, and suffered martyrdom there in the reign of Nero.

PETER THE GREAT, *b.* 1672, *d.* 1725, the founder of modern Russia, son of the Czar Alexis, succeeded to the throne in 1682. The Russia of those days had no access to the Black Sea or the Baltic, and Peter early determined to gain access to both; hence his wars with Turkey and Sweden. In the Swedish wars he was almost uniformly unsuccessful until the defeat of Charles XII. at Pultowa gave him, at one blow almost, the Baltic territory he had so long desired. Meanwhile he had paid long visits to Holland and England, and laboured in the dockyards of both countries to gain an insight into naval construction; he had enlisted many skilled foreign workmen and professors; and had done much to promote education and civilisation among his subjects. He founded St. Petersburg, and soon had it populated by means of lavish promises and privileges. His zeal for reform did not extend to himself; for to the last he was passionate, cruel, and brutal. His own son, Alexis, was cast into prison, and died there, for opposing some of his reforms. In his last years he made war on Persia for the sake of gaining access to the Caspian Sea.

PETER THE HERMIT, a monk of Amiens who, towards the end of the 11th century, roused Europe to frenzy by his recital of the indignities heaped upon pilgrims to Jerusalem by the Mohammedans, and the difficulties placed in their way. He besought the princes of Europe to rescue Jerusalem from the Mohammedans by force, and, although they agreed, he would not wait for the assembling of a regular military force, but started off himself on foot through Europe at the head of a hastily-raised and ill-equipped body of volunteers, most of whom perished on the way. After seeing Jerusalem taken by the regular army, Peter returned, and became prior of Huy, near Liège, where he died, 1115.

PETERBOROUGH, a city of Northamptonshire, on the north bank of the river Nen. Its chief interest is centred in its noble cathedral, and its importance depends on its great corn market. It is also an important railway centre. The present cathedral dates back to 1143, but its site was occupied by an abbey as early as 655. Its finest feature is its magnificent west front.

PETERHOF, a village in Russia, about 12 miles west of St. Petersburg. Here is situated the Peterhof Palace, erected by Peter the Great as a summer residence, and still used by the imperial family; population 14,000.

PETERLOO MASSACRE. On August 10th, 1819, a meeting was being held on St. Peter's Field, Manchester, to discuss the question of Parliamentary reform. The magistrates called upon the assemblage to disperse, and on their failing to do so, ordered the military to fire and then charge. A number of persons were in consequence killed and wounded. The name "Peterloo" is, of course, a play upon "Waterloo."

PETER'S PENCE, an offering of money formerly made every year to the Pope by England and other Roman Catholic countries. It originated with one of the Saxon kings, either Ina of Wessex or Alfred the Great, and consisted of a silver penny, paid by each family of standing or wealth. After the Reformation its payment ceased, but of late years it has been revived.

PETITION OF RIGHT, a document presented to Charles I. by the Parliament of 1628. It protested against illegal taxation, illegal imprisonment, the billeting of soldiers on private persons, and the application of martial law to ordinary citizens. Charles, on promising to redress these grievances, received a liberal grant of money from Parliament, and then proceeded to govern as before.

PETITIO PRINCIPII, a faulty form of argument, in which the conclusion desired is really assumed in one of the premises.

PETRARCH, FRANCISCO, *b.* 1304, *d.* 1374, a celebrated Italian poet, often looked upon as the first *modern* poet, being the leader in that self-analytical strain that marks much of the poetry of the last few centuries. His life was passed in courts, either in the *entourage* of the Pope at Avignon, or of some great prince of the time. His passion for Laura, a French lady at Avignon, gave birth to the poetry that has immortalised him, but he prided himself more upon his Latin poetry, of which he wrote a large amount.

PETREL, THE STORMY. This little bird, scarcely larger than a lark, is called by the sailors "Mother Carey's Chicken." They regard it as a bird of evil omen, because it is most frequently seen in stormy weather, when it flies just above the waves, feasting on the molluscs that are then driven to the surface. It is the smallest web-footed bird known.

PETROL, a light and very inflammable oil, largely used as the source of power in automobiles. It is one of the first of the light oils derived from crude petroleum on distillation. To produce each stroke of the piston a small quantity of petrol is vaporized and mixed with air, when it is ready to be ignited by the electric spark. See *Automobile*.

PETROLEUM, "rock-oil," a highly inflammable oil obtained from the interior of the earth. Petroleum has been known as far back as history goes. Herodotus and other classical writers mention it, and it is alluded to in some of the earliest Chinese writings. But not till after 1850 was any serious attempt to extract from it an illuminating oil by means of refining.

Soon after that date a company was formed to sink wells near Titusville, in Pennsylvania, and this was so successful that numerous others soon followed. Petroleum is also found in some of the other States, but the bulk is produced in Pennsylvania. At first refineries were erected near the wells, but as these multiplied, the advantage of large central refineries was seen, and pipes were laid to conduct the crude oil to the refinery. The principal refineries, however, are now situated near the sea-board, at New York, Philadelphia, Cleveland, etc., and to convey the crude oil to these places hundreds and even thousands of miles of pipe have been laid. The Standard Oil Company now controls the greater part of the American trade. About 1,500 million gallons of petroleum are produced in the United States every year.

Petroleum is also found in great plenty near Baku, on the Caspian Sea, but the oil found here is of a grosser nature than that of the States. Oil-fields of a remunerative nature are also found in the East Indies, Burma, Assam, Austria, and other places. The most important production of petroleum is the illuminant called paraffin, and the more highly refined petrol, but the naphthas and heavy oils produced in distillation are very valuable. Vaseline, or petroleum jelly, is a valuable unguent obtained from petroleum.

PETTY OFFICERS, NAVAL, are a most important class of men. Corresponding to the non-commissioned officers in the army, they are constantly with the men, though no longer of them. Chosen from the steadiest and most intelligent of the men, they have corresponding pay and privileges, the former ranging as high as 7*s.* 6*d.* per day.

PEWTER, an alloy of tin and lead, or of tin, antimony, and copper. The former is the cheaper, and was once extensively employed in making drinking vessels and measures, but the lead caused great danger of poisoning. The latter alloy produces a very useful metal, the one called Britannia metal being much used.

PHAËTHON, in Greek mythology the son of Helios (sun), who one day was permitted to drive the chariot of the sun across the heavens. Being unable to control his fiery steeds, he came so near the earth as almost to set it on fire, and for his presumption in daring to drive was slain by Jove with a thunderbolt.

PHALANX, a formation of troops for battle much favoured by the ancient Greeks, more especially by Sparta, Thebes, and Macedon. The Macedonian phalanx had a front of five hundred men and a depth of sixteen. The onset of such a dense body of men was generally irresistible; even the Romans dreaded it.

PHARISEES, a religious party among the Jews, distinguished by their devotion to the letter of the Law. Proceeding at first from a laudable principle, namely, that the salvation of their nation depended more upon their obedience to God's laws than on political expediency or military measures, they gradually lost sight of the end in their devotion to the means, and thus sank into the self-righteousness our Lord had so often to condemn.

PHARMACY, the art of preparing and compounding medicines. It is sometimes termed *Pharmaceutical Chemistry*.

PHEASANT, a family of half-domesticated birds, first introduced into Britain about the end of the 12th century. There are numerous species found in the warm and temperate parts of Asia, some of which, as the Golden Pheasant and the Silver Pheasant, have most beautiful markings. The pheasant is highly prized as a game-bird, and is carefully reared for sport, great care being required to bring the young birds to maturity. The close time for pheasants is from February 1st to September 30th.

PHELPS, SAMUEL *b.* 1804, *d.* 1878, an actor, noted chiefly as a tragedian. He made his début in London, 1837, as Shylock, with great success. His great achievement in life was his successful management (1844–1862), of Sadler's Wells, Islington, which in spite of its unfavourable situation became famous for the excellence of its plays, and drew lovers of "legitimate" drama from all parts of the metropolis. Lovers of Shakespeare had the opportunity of seeing more than thirty of his plays during Phelps's management.

PHIDIAS, *b.* about 500 B.C., the greatest sculptor of Greece, and therefore of the world. He was employed by Pericles to aid in the transformation of Athens, above all in the adornment of the temple of Athene on the Acropolis, called the *Parthenon*. The colossal statue of Athene, made of ivory and gold, was the work of the artist's own hands. The statue of the Olympian Zeus, however, is considered his masterpiece. An example of the exquisite workmanship of Phidias may be seen in the well-known fragments of the frieze of the Parthenon now preserved in the British Museum.

PHILADELPHIA, the chief city in Pennsylvania, U.S.A., on the Delaware River, about 100 miles from the sea. Founded and planned by Penn, the city has a stone marking the site of the elm-tree under which Penn is said to have made his famous treaty with the Indians. The old "State House," where the Declaration of Independence was adopted in 1776, is carefully preserved. Philadelphia is now the third city in the United States; population exceeds 1,400,000.

PHILANDER, a virtuous youth in Ariosto's "Orlando Furioso," between whom and a certain married lady there was much love-making. The word is now used to express a sentimental admiration for a lady without any real attachment.

PHILIPHAUGH, an interesting country seat in Scotland, 3 miles west from Selkirk. Here, in 1645, Montrose was defeated by General Leslie, and the Stuart cause was ruined in Scotland.

PHILIP II. OF MACEDON, king of Macedonia from 360 to 336 B.C., was brought up as a boy amongst the Thebans, then the best warriors of Greece. He soon introduced among his subjects the military improvements he had learnt at Thebes, and the Macedonian phalanx carried his arms successfully on all sides. His insidious designs were seen through by Demosthenes, who, in the celebrated "Philippics," tried to rouse the Athenians to resist him. When they did so, it was too late, and Philip was declared the head of Greece. This position enabled him to prepare for war with Persia, but he was assassinated on the eve of starting, and had to leave the great design to his son Alexander.

PHILIP II. OF FRANCE, reigned 1180–1223, and was thus contemporary with Richard *Cœur de Lion*, and his brother John. He joined Richard in the third Crusade, but soon returned to intrigue with John against his absent brother. On John's accession, Philip espoused the cause of Arthur, and succeeded in detaching from England all her French possessions except Guienne and the Channel Islands.

PHILIP II. OF SPAIN, son of the Emperor Charles VI., reigned over the Spanish dominions, 1556–1598. His second wife was Queen Mary of England, by whose death, in 1558, England escaped his tyranny. The great object of his policy throughout his reign was to establish a despotic form of government in all parts of his empire, and to restore the Roman Catholic religion in the Protestant countries of Europe, and especially in the Netherlands, which formed part of his dominions. With a like end in view, he fitted out the "Invincible Armada," for the subjugation of England. The cruelties perpetrated in the name of religion by the Inquisition in his reign had his full sanction and approval.

PHILIPPI, an ancient city of Macedonia, founded by Philip of Macedon, with a view to working the neighbouring gold mines. Here was gained the famous victory of 42 B.C., by Octavius and Antony, when with the fall of Brutus and Cassius perished the great Roman republic. Here, too, Saint Paul was scourged and imprisoned, and to the Philippians he addressed one of the most touching of his epistles.

PHILIPPICS, three orations of Demosthenes against Philip of Macedon. The name is also applied to the speeches in which Cicero denounced Antony, and is now used to denote any speech in which a particular person is violently attacked.

PHILIPPINES, a large group of islands in the Pacific Ocean, to the north-east of Borneo. They have an area of about 115,000 square miles, nearly the size of the British Isles. Fertile in the extreme, the islands produce all kinds of tropical vegetation in abundance. Metals abound, and coal is worked to some extent. Hemp, sugar, cotton, tobacco, gold dust and ornamental woods are largely exported, chiefly to Britain, in return for manufactured goods of various kinds. Since the outbreak of the Spanish-American War in 1898, trade has been much interrupted, and since the end of the war, when the Philippines were ceded to the United States, the natives have fought, but without success, for their independence. The inhabitants, some 8 to 10 millions in number, are of very diverse origin and degrees of civilisation. The trades and industries of the island are almost entirely in the hands of Chinese and half-castes. Manila, the capital and chief port, stands on a large bay in the south-east of Luzon, the largest island.

PHILO, a Jewish philosopher who flourished during the first fifty years of the Christian era. We know that he was of a wealthy Jewish family of Alexandria, and that he had been well educated. He seems to have read most of the extant Greek authors, and studied the various systems of philosophy. Thus equipped, he strove to reconcile Jewish theology with Pagan philosophy, so as to make the doctrines of the former acceptable to professors of the latter. His numerous works are still highly valued as showing the line upon which religion can be treated logically and rationally.

PHILOL'OGY, a term which, at the present day, signifies the science of language, a science that involves the searching comparison of various languages with a view to their classification and the ascertainment, if possible, of some common origin.

PHILOSOPHER'S STONE. The chemistry of to-day is the child of the ancient alchemy, as surely as astronomy is the successor of astrology. One aim of the alchemists in all their researches was to discover the unknown substance which, they believed, would drive off the impurities from baser metals, and leave behind only the gold on which, as it were, they were built. This substance was usually spoken of as the "Philosopher's Stone."

PHILTRE, a draught whose effect was supposed to be that of exciting, in the drinker, love for a particular person. Among the ancients, belief in the efficacy of philtres was very common, both the Greeks and Romans, as well as Eastern nations, using them to a considerable extent. Even now their power is believed in by semi-civilised peoples. Shakespeare and other poets allude to the belief.

PHŒBE, a name often applied to Diana (Artemis) as the goddess of the moon, and so often used by poets to denote the moon herself. Similarly Phœbus, one of the names of Apollo, came to denote the sun, Apollo being the sun-god.

PHŒNICIA, a district along the eastern shore of the Mediterranean for about 200 miles to the north of Palestine, and about 10 to 30 miles in width. In its narrower acceptation, the name denotes only the land immediately around the great cities of Tyre and Sidon. The Phœnicians were a trading and colonising people. Their dealings with Solomon show that their friendship was not despised, and their voyages to Britain for tin prove their adventurous daring. Their independence ended with their conquest by Alexander in 333 B.C. Henceforth their lot is identified with that of Syria.

PHŒNIX, THE, a fabulous Egyptian bird, supposed to visit the temple dedicated to it at Heliopolis every 500 years. When about to die, the bird built itself a funeral pile of aromatic wood, which it kindled by swiftly fanning its wings, and after it was consumed a new phœnix arose from its ashes.

PHŒNIX PARK, a handsome stretch of ground just outside Dublin. It is 7 miles in circuit, and has an area of about 1,800 acres. The Park has a melancholy notoriety from the murder there of Lord Frederick Cavendish in 1882.

PHONOGRAPH, an instrument for recording sounds by transferring the vibrations of an elastic membrane to a needle which presses on the surface of a drum of wax or tinfoil. The membrane receives the sound-waves of the voice or musical instrument, whose tones are to be reproduced, and causes the needle to make more or less deep and frequent impressions according to the loudness and pitch of the sound. If now the needle be brought back to the starting point and made to go over the depressions and elevations again, the membrane will be set vibrating as at first, thus producing sounds similar to the original ones, but of less intensity. The phonograph has been produced in somewhat different forms, under various names, such as *gramophone* and *graphophone.*

PHOSPHATES, a compound of phosphoric acid with a metal. The phosphates enter largely into man's economy, forming the greater part of the earthy matter in his bones, as well as being present in the less solid part of his body. All organic substances contain phosphates, hence the value of manures containing them to enrich exhausted land.

PHOSPHORESCENCE, the power possessed by certain substances, mineral, vegetable, and animal, of emitting a more or less feeble light in the absence of any other light-giving body. It is very noticeable in the case of decaying fish; jelly-fish often "shine" in the dark; the glow-worm and the firefly are well known, and even some mosses and funguses are phosphorescent.

PHOSPHORUS, (1) "the light bringer," a name often applied by Greek writers to the planet Venus when it is a morning star, as it does not come into view till just before sunrise, and may thus be said to usher in the day. The name was also applied to certain deities, notably to Venus and Hecate. (2) A chemical element with very marked characteristics. It is not met with in nature, but is easily obtained from bone ash, of which it forms about one-fifth by weight. It unites very readily indeed with oxygen; hence the necessity for keeping the air away from it. Phosphorus is largely used in various arts, especially in the manufacture of matches, but great care is necessary to avoid inhaling its noxious fumes, unless red or amorphous phosphorus (which produces no fumes) is the substance used.

PHOTOGRAPHY. The art of photography depends on the principle that nitrate of silver, and a few other chemical compounds, are decomposed by the action of light, thus causing any surface they may cover to vary in appearance according to the amount of decomposition that has occurred. If, therefore, a thin sheet of glass or other transparent substance is coated with one of these chemicals, placed in a tube, and then light from a group of objects is allowed to pass through the tube, the surface is thus affected, and a photographic *negative* is produced. The fixing of the negative and the transference of the picture to prepared paper complete the process, and we then have a photograph. The beginnings of photography may be placed early in the 19th century.

PHOTOGRAVURE, a method of reproducing drawings or photographs from a plate prepared with the aid of photography. The plate is covered with a prepared gelatine, on which the subject is photographed; the gelatine is removed where not wanted, and the plate is then treated with iron perchloride, which eats it away in the desired places, and thus creates a depression for the ink to settle in after the manner of the old steel engraving plate.

PHOTOPHONE, an apparatus for transmitting sound by means of a beam of light and the metal, selenium. Professor Graham Bell, an American scientist, had noticed that selenium offered a high resistance to the passage of electricity, which was greatly diminished when the selenium was exposed to light. Acting on these data, he constructed an apparatus by which a beam of light from a flexible mirror was centred on a selenium cell connected with a telephone. The voice of a speaker set the mirror in vibrations, which were transmitted to the beam of light, acted on the selenium cell, and thus reproduced in the telephone the tones of the speaker.

PHRENOLOGY, "the science of the mind," professes to lay down rules whereby the disposition, capacity, and mental faculties of a person can be diagnosed by observing the shape and configuration of the skull or brain case. This so-called science was started in Germany by Drs. Gall and Spurzheim, about 1800, and they soon gained many converts, but careful investigation into their system, whenever made, has not tended to convince scientific men of its truth.

PHYLACTERY, a slip of parchment on which are written certain texts of Scripture. These parchment slips had straps attached by which they were fastened on the arm or head while the wearer was engaged in prayer. Some of the Pharisees used to have them extra large, and put them on in the street to attract attention to the fact that they were performing their devotions. Certain Jews at the present time wear their phylacteries all day long.

PHYLLOXERA, a kind of insect somewhat similar to the aphides, or green fly so common on rose-trees and other plants. It is a parasite of the vine, and has caused great damage in France since its appearance in 1863. It makes its home in the roots as well as the leaves, so the difficulty is to destroy it without harming the plant itself.

PHYSICS, that branch of science which includes mechanics, light, heat, sound, magnetism and electricity. It excludes all those phenomena which properly belong only to chemistry, i.e., the phenomena attendant on changes in the composition of matter. Thus the fact that water expands with heat belongs to both branches of science, but its proper place is under "Physics," because no change is made in its composition.

PHYSIOLOGY, that branch of science which investigates the structure and functions of living beings. Properly the name morphology is given to the study of structure, but inasmuch as the functions of the various organs cannot be considered without a knowledge of their position and shape, a certain amount of morphology must always be included in physiology.

PIASTRE, a silver coin once used in Spain and Italy, of the value of about 4s. Now-a-days there is a piastre current in Turkey and Egypt of the nominal value of about 2d., and another current in Tunis of the nominal value of 6d.

PIBROCH, "pipe music," the name given to warlike music adapted to the bagpipes. Among the Highlanders, each clan has its own pibroch, and its stirring effect on the clansmen is said to have been wonderful. Generally speaking, the pibroch is a descriptive piece of military music, and persons with delicate musical ears accustomed to the bagpipes say they can distinguish the advance, the charge, the retreat, and the flight, as it is played.

PICTON, SIR THOMAS, one of the heroes of the Peninsular War, was born in Pembrokeshire, 1758. He entered the army at 14, and soon gained the rank of captain. In 1794 he went to the West Indies, where he did much service. When Wellington was appointed to command in Spain, he specially asked for the services of Picton, who took a foremost part in nearly every engagement that took place in the Peninsula, and seven times received the thanks of the House of Commons for his services. He fell at Waterloo in repelling a desperate charge of the French.

PICTS, "the painted people," a name given to the Celts of Northern Britain by the Romans and Romanized Britons. The Celts who acquired this name settled in Britain before the later comers, who called themselves Britons. Whether they landed in the south, and were driven northward by the later bands, or whether they landed originally in Scotland, we do not know. Undoubtedly they were akin to the Britons, but were on a lower plane of civilisation. In their struggles with the Romans, and later with the Saxons, they were always aided by the Scots, who came from Ireland and afterwards became the ruling race in Scotland. After the 9th century the Picts practically disappear as a separate race.

PIERS PLOWMAN. See *Langland.*

PIETERMARITZBURG, the capital of Natal, is situated about 50 miles above Durban, the chief port of the Colony. It is healthily situated, being about 2,000 feet above the sea, and its broad streets and handsome buildings give it a prosperous appearance. It takes its name from two of its Boer founders, Pieter Retief and Gert Maritz; population 31,000.

PIGEON. The pigeon is found in almost every part of the globe. Many varieties are recognised, and of these the commonest in Britain are the wood-pigeon and rock-dove. From the latter most of the domesticated varieties have been derived. In a wild state the pigeon usually builds its nest in lofty trees,

and feeds upon grain. Its song consists of a rather mournful coo. The pigeon possesses remarkable powers of flight, and in certain of the domesticated varieties these powers have been increased by attention to breeding. The best known of the domesticated varieties are the tumbler, pouter, fantail, and carrier. It is worth remarking that the "carrier" so-called is useless for letter-carrying and "homing" competitions.

PIGEON ENGLISH, a dialect or jargon which forms the ordinary means of communication between the Chinese and the English traders. The words are either Chinese or English, and the sentence is constructed on the Chinese plan. The name is said to be derived from "Business English," "pigeon" or "pidgin," representing the Chinese pronunciation of the word "business."

PILATE, PONTIUS, a Roman soldier who was procurator of Judæa from 26 until 36 A.D. He tried and condemned Christ, although convinced of his innocence. Many legends are told concerning Pilate. He is said to have committed suicide.

PILATUS, MOUNT, is situated in the centre of the tourist district of Switzerland, near Lucerne. It is about 7,000 feet high, and from its summit a magnificent view may be obtained. Tourists may ascend the mountain by means of a railway.

PILCHARD, a fish which much resembles the herring, though it is usually somewhat smaller. Pilchards are found in enormous numbers off the coasts of Cornwall, North-western France, and Portugal, and in the Mediterranean Sea. They are caught either with a drift or seine-net. The fishing season in Cornwall falls during the summer months, and large quantities are salted and exported to the Mediterranean countries. In France, the smaller varieties are preserved in oil, and sold as sardines.

PILGRIMAGE OF GRACE, the name given to an insurrection in favour of the "old religion," which occurred in the northern counties of England, 1536. It was caused by the religious changes which had been made by Henry VIII. The rebels dispersed upon a promise of a general pardon, but the ringleaders were subsequently taken and executed.

PILGRIM FATHERS, the name given to those Puritans who, failing to obtain religious liberty in England, sailed for America in the ship *Mayflower*, and established a settlement at New Plymouth (Mass.), 1620. They numbered about 120.

PILLAR SAINTS, or *Stylites*, a class of ascetics who were met with not unfrequently in Syria and Greece during the 5th and 6th centuries of Christianity. They spent their lives upon the top of high pillars. The best known is one named Symeon, who in the 5th century is said to have lived for thirty years on the summit of a pillar about a yard in diameter. He removed successively from one pillar to another, always increasing the height, which in the last of them was 72 feet.

PILLARS OF HERCULES, the name given by the ancients to the two promontories which are situated at the entrance to the Mediterranean Sea, one on either side of the Straits of Gibraltar. Their modern names are the "Rock of Gibraltar" and "Mount Hacho." According to tradition, they were torn asunder by Hercules.

PILLORY, an instrument of punishment formerly in use in England and some continental countries. It consisted of a horizontal plank, supported upon a vertical post, the whole arrangement being placed upon a raised platform. Into holes cut in the plank the criminal's head and wrists were fixed, and he was then exposed for some hours to the insults of the mob. The use of the pillory was discontinued in England in 1837.

PILOT, a person taken on board a vessel to navigate it into a port or harbour, or through a dangerous channel. In England, pilots are under the control of the Trinity House Commissioners, who hold examinations and grant licences to suitable persons. The pilot is in sole charge of the vessel during the time he is on board, and is responsible for its safety. In general, it is a punishable offence to take a vessel into a harbour, unless there is on board a pilot licensed for that harbour. Small vessels, such as coasters, are, however, exempt in this respect.

PIMENTO, or allspice, is obtained from the berries of a species of myrtle which grows in Jamaica. The berries are gathered in September and dried in the sun. Pimento is used in cookery, and is said to possess the combined flavours of cinnamon, cloves, and nutmegs. It is sometimes called "Jamaica pepper."

PINCHBECK, CHRISTOPHER, a watchmaker who lived during the 18th century, is remembered as the inventor of an alloy of copper and zinc, which is known as "Pinchbeck." It is yellow in colour, and bears some resemblance to gold, and is in consequence used in the manufacture of cheap jewellery. From this fact the term "pinchbeck" has come to be used in the sense of *spurious* or *inferior*.

PINDAR, *b.* near Thebes, Greece, 522, *d.* 443 B.C., the greatest of the Greek lyrical poets. When Alexander the Great sacked Thebes, he ordered the house of Pindar to be spared.

PINDAR, PETER. See *Wolcot John*.

PINE, a cone-bearing tree which is found in all parts of the northern hemisphere. It flourishes in a poor soil and in the most exposed positions. The pine, in common with other conifers, sheds only a portion of its leaves each year. The best known species are the Scotch fir, as it is incorrectly called, the Red Canadian or Yellow Pine, and the Pitch Pine. The "Scotch fir" is the only species of pine indigenous to Britain. The timber of the pine is very valuable; it is used for all manner of purposes, and, in addition, the timber of most of the species yields turpentine and tar. (See *Fir*.)

PINE-APPLE, the fruit of a plant which is a native of tropical America. The plant is now cultivated in many other parts of the globe, and is a common hothouse plant in England. The fruit, which weighs from three to about ten pounds, is of a golden yellow colour inside and is exported in large quantities from the Azores and Bahamas.

PINERO, ARTHUR WING, *b.* in London, 1855, became an actor in 1874, and a dramatic author in 1877. In 1893, departing from purely humorous comedy, he struck a new vein in "The Second Mrs. Tanqueray," which he followed up with "The Notorious Mrs. Ebbsmith." "The Gay Lord Quex," and others, which in spite of much adverse criticism, have given the author a foremost place among the dramatists of to-day.

PINK-EYE, a complaint which affects horses. Its symptoms resemble those of fever, and it is usually accompanied by an inflammation of the eye-lids; hence its name.

PINKIE, a village situated a few miles east of Edinburgh. It was the scene of a battle in which the Duke of Somerset, acting as regent for Edward VI., defeated the Scots, 1547. The war was caused by Somerset trying to force the Scots to carry out the terms of a treaty, by which Edward VI. was to marry Mary, Queen of Scots.

PINS. It is estimated that about 80 millions of common pins are made each day in England, the greater part at Birmingham. More than half that number is made every day in the United States, and other countries do their share. The first pins were probably of wood or small fish bones. Pins of bone and bronze are found in the lake dwellings of the continent, and even the safety-pin was anticipated, in form at least, by their prehistoric inhabitants.

PIONEERS, a military term, applied to those soldiers who precede a regiment on the line of march, and perform rough engineering work, such as mending roads, or building temporary bridges. Ten pioneers and one sergeant are attached to each regiment of infantry.

PIPECLAY, a kind of clay found mostly in Dorset and Devon, and largely used on account of its whiteness and fineness for the manufacture of tobacco pipes. It is also sold in dried cakes and used by soldiers for whitening belts, gloves, etc.

PIRACY. Among the ancients piracy was recognised as an almost lawful calling. The Phœnicians and Greeks frequently combined trading and piracy. The Vikings of Scandinavia in the 9th and 10th centuries also scoured the seas for plunder. Piracy throughout the Middle Ages seems to have been common among all nations. In the 13th and 14th centuries, Hallam tells us, a rich vessel was never secure from attack, and neither restitution nor the punishment of the criminals could be obtained from any government. In the reign of Elizabeth we find her "sea-dogs" always ready to rifle a Spanish treasure-ship, even when the two nations were at peace. In the 17th century the most noted pirates were the *Buccaneers* of the West Indies, who preyed upon the Spanish. The latter denied the right of either France or England to establish settlements upon the mainland of South America or upon the adjacent islands, and for a considerable time the buccaneers had the unofficial support of both the French and English governments. The most famous of the buccaneers was a Welshman named Morgan, who eventually became Governor of Jamaica. Another great centre of piracy in modern times was Algiers. Not only were merchant ships rifled by the bands of pirates that infested the Mediterranean, but the seamen were captured and treated as slaves. It was at one time the practice of philanthropists to raise funds for the ransom of Christian slaves in the Barbary States. In the time of the Commonwealth, Admiral Blake read the pirates of Algiers a severe lesson, but the evil continued, more or less, until 1816, when Lord Exmouth bombarded Algiers and set free 1,200 prisoners. Even now, pirates are not unfrequently met with in the Indian and Chinese Seas.

PIRÆUS, the harbour and port of Athens, is distant from that city about 6 miles. The harbour was commenced about 450 B.C., and was for some time connected with Athens by two walls, each 60 feet in height, enclosing a road between them.

PISA, a town of Italy, situated on the Arno, about 6 miles from the sea. It possesses a university, a magnificent cathedral, and the famous campanile known as "the leaning tower." In the Middle Ages, Pisa was a great seaport and republic, and was finally conquered by Florence. Its commercial importance has disappeared, owing to the silting up of the Arno; population, 62,000.

PISCI'NA, the name given to a shallow basin which is seen in ancient churches, built into the wall near an altar. It is usually provided with a canopy, and

was intended to receive the water in which the chalice is washed after the celebration of the Mass. It is still in use in Roman Catholic churches.

PISGAH, a mountain situated in Palestine, a few miles to the east of the Dead Sea. From one of its summits, Mount Nebo, Moses viewed the Promised Land.

PISTOLE, a gold coin once current in France, Spain, and Italy, worth fifteen or sixteen shillings.

PITCAIRN ISLAND is situated in the Southern Pacific Ocean, 130° west longitude. It was discovered in 1769, and in 1790 was peopled by the mutineers of the *Bounty*. The present population, which numbers about 120, is descended from the mutineers, who intermarried with Tahitian women. Owing to constant intermarriage, the great majority of the present inhabitants are little better than imbeciles.

PITCH, a glossy, black and very brittle substance, which is obtained by distilling wood, tar, coal-tar, etc. As a result of distillation a spirit is given off, and the solid substance known as pitch remains. It is used in caulking the seams of ships, as fuel, and in the manufacture of asphalt and lamp black. Burgundy pitch is really a resin, and is obtained from the spruce-fir.

PITCHBLENDE, an oxide of the rare metal, uranium. It is an opaque, brittle mineral, usually greyish-black. It occurs but sparingly in nature, and generally in veins accompanied by ores of silver and lead. Austria is the principal source of supply, but recently considerable quantities in association with other uranium compounds have been found at St. Stephen's, Cornwall. It was while experimenting with pitchblende that Professor and Madame Curie discovered radium.

PITMAN, SIR ISAAC, *b.* at Trowbridge, 1813, *d.* 1879, was the originator of a well-known Phonic system of shorthand. He was originally a school teacher, and published a treatise upon shorthand in 1836. Later he abandoned teaching and became the head of the firm of Pitman and Sons. The publications of this firm are mainly connected with the Pitman Method, and the present popularity of the system is largely due to this fact. Several other systems are much simpler in character.

PITT, WILLIAM, Earl of Chatham, *b.* in Cornwall, 1708, *d.* 1778, a brilliant statesman and orator, is often spoken of as the "Great Commoner." He made his reputation by his opposition to Walpole. In 1757 he became Secretary of State in the ministry of the Duke of Newcastle, and practically controlled the affairs of this country during the progress of the Seven Years' War. In the dispute with the American Colonies he supported the claims of the Colonists. His last speech in the House of Lords was made on this subject, and during the course of it, he fell in a swoon and had to be carried from the House. His death occurred a few days later.

PITT, WILLIAM (the younger), *b.* near Bromley, 1759, *d.* 1806, the second son of the Earl of Chatham, was one of the most brilliant of English statesmen. He became Premier at the age of twenty-five, and remained in office until 1801. He returned to power in 1804, and remained until his death. It fell to his lot to govern England during the dangerous times of the French Revolution, and later he became the great opponent of Napoleon. His home policy was firm almost to severity. The wars which he was compelled to wage with France and her allies led to heavy taxation. In 1800 Pitt succeeded in securing the union of the English and Irish Parliaments. He managed this by wholesale bribery, but whatever his methods with others, he was himself perfectly honest, and he died a comparatively poor man. It is said that his death was hastened by his failure to counteract the successes of Napoleon. "Roll up the map of Europe," he remarked after hearing of Napoleon's victory at Austerlitz.

PITTSBURG, the "Iron City," is one of the largest manufacturing towns in the United States. It is situated on the Alleghany River in the state of Pennsylvania, in a district exceptionally rich in coal, iron, oil, and natural gas. Pittsburg specialises in the manufacture of hardware and glass. Amongst many famous firms which have their head-quarters there, may be mentioned the Carnegie and Westinghouse firms: population 330,000.

PIUS IX., *b.* 1792, *d.* 1879, became Pope in 1846. His period of office was marked by his unsuccessful efforts to bring about a union of the Italian States under papal supremacy. In 1870, on the withdrawal of the French garrison from Rome, he was deprived of all temporal power. To his influence was due the assembling of the Vatican Council in 1870, which adopted the doctrine of the Infallibility of the Pope.

PIUS X., *b.* near Venice, 1835, succeeded Leo XIII., 1903. He was born in humble circumstances, and was for many years an obscure parish priest. He eventually became bishop of Mantua and, later, Patriarch of Venice, but his election to the papal chair came as a surprise to most people.

PIZARRO, FRANCISCO, *b.* about 1476, *d.* 1541, a celebrated Spanish adventurer and the conqueror of Peru, spent the early years of his life as a swineherd. He was with Bilbao when the Pacific Ocean was first seen by European eyes, and in 1524 set sail from Panama and discovered Peru. Having obtained assistance from Spain he conquered that country, and in 1531 treacherously murdered the reigning Inca. Owing to a disagreement among the Spaniards, a sort of civil war arose and he was murdered. He was an exceedingly illiterate man, though possessed of considerable natural ability, and his dealings with the native population of Peru were characterised by extreme barbarity.

PLANCHETTE, a small heart-shaped piece of wood, mounted upon three legs, one of which is a lead pencil, and the other two ordinary supports provided with castors. It is used in spiritualistic séances, the operator placing his hand upon the wood and guiding it across a sheet of paper. Its movements have not been explained, but spiritualists claim that the words which are traced out by the lead pencil are messages from the spirit world.

PLANE-TREE, a tree which grows in the temperate regions of the northern hemisphere. It flourishes in the smoke of large towns, and may readily be distinguished by its bark which peels off during the autumn months. The Thames Embankment is lined with plane-trees, and many fine specimens may be seen in other parts of London. The timber of the older trees is used in cabinet work.

PLANETS, the name given to those bodies which revolve round the sun. The "Major" planets are eight in number, Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. The first mentioned six were known to the ancients; Uranus was discovered in 1781 and Neptune in 1846. The planets are more or less spherical bodies, which revolve round the sun in elliptical orbits, and in addition possess a movement of rotation. They are non-luminous bodies and shine by reflected light. The "Minor" planets are much smaller bodies which have their orbits between those of Mars and Jupiter. The word planet literally means "a wanderer," and the name was given to the bodies because of their apparently erratic wanderings in the heavens. The cause of this wandering was made apparent when it was understood that the planets revolve round the sun, and not, as the ancients believed, round the earth. (See *Solar System.*)

PLANTAGENET, GEORGE. See *Clarence, Duke of.*

PLANTAGENET, HOUSE OF, the name given to a line of kings who ruled over England from 1154 until 1399. The first of the line was Henry II., the son of Matilda, daughter of Henry I. and Geoffrey of Anjou. The word "plantagenet" is derived from "planta genista," (the broom-plant), a sprig of broom being the badge of the House of Anjou, which Henry II. adopted. The last of the line, Richard II., was deposed by Henry IV., the first of the Lancastrian line, and subsequently murdered. The Plantagenet kings are often called Angevin kings, as they derive their descent from Geoffrey of *Anjou.*

PLANTAIN. See *Banana.*

PLASSY, a town situated in India, on a branch of the Ganges, about 100 miles north of Calcutta. It is famous as the scene of a battle fought in 1757, in which Clive defeated Surajah Dowlah, the Nabob of Bengal. As a result of the battle, Bengal passed into the possession of the English, and the foundation of our Indian Empire was laid.

PLASTER OF PARIS. See *Gypsum.*

PLATINOTYPE, a photographic process by which very permanent prints are secured. The paper used is sensitised with a chemical containing platinum, and after printing is treated with a solution that causes the platinum to be deposited, and thus build up the picture.

PLATINUM, a rare and valuable metal which is obtained principally from the Ural Mountains and California. In its pure state it is a soft, whitish metal, much resembling silver. It melts only at a very high temperature, does not oxidise when exposed to the atmosphere, and is not affected by the strongest acids. The crucibles and stills used in the manufacture of sulphuric acid are made of platinum, and it is also of considerable use in laboratory work and in making electrical connections.

PLATO, *b.* 429, *d.* 347 B.C., one of the greatest of the Greek philosophers, was the founder of the Platonic School of Philosophy. Of his life but little is known; he was a pupil of Socrates, and taught in the grove of Academus, at Athens. He spent some time in Sicily, and there incurred the displeasure of Dionysius of Syracuse, who sold him as a slave. He was, however, set at liberty, and returned to Athens. The greater part of his works are expositions of the views of Socrates, and they are written in dialogue form. The finest translation of his works is by the late Professor Jowett.

PLATONIC LOVE, the name given to the friendship or love existing between a man and a woman, when that love is unaccompanied by any sensual desire. It was advocated by Plato, hence its name.

PLATYPUS. See *Ornithorhyncus.*

PLAYFAIR (LYON), BARON, *b.* in India, 1818, *d.* 1898; a great chemist and prominent politician of the 19th century. He was a favourite pupil of the great Liebig, and enjoyed the confidence of the Prince Consort, who gave him a large share in managing the Great Exhibition of 1851. The present system of managing

the Civil Service is largely the outcome of his inception.

PLEBISCITE, literally a decree of the people, is the name given to the taking of a general vote of the whole nation to decide some particular point in dispute. It is most commonly used in reference to certain elections held in France, notably that by which Napoleon III. was elected Emperor.

PLEBS, OR PLEBEIANS, the free-born commons of Rome in its early days, as opposed to the Patricians, who possessed all political privileges. They probably arose from immigrants allowed to enter and settle in the city after its foundation and organisation, but excluded from political rights, although compelled to render military service.

PLEDGE. See *Commercial Dictionary.*

PLEI'ADES (a-des), in classical mythology, the name given to the seven daughters of Atlas, who died of grief and were placed as stars in the heavens. The group of stars known as the Pleiades is a cluster of six small stars situated in the constellation Taurus.

PLEVNA, a town of Bulgaria, situated about 90 miles north-east of Sofia. It occupies an important strategic position, and is famous for the heroic defence made there by the Turks under Osman Pasha, 1877. The Russians unsuccessfully tried to take the town from July until December, and then Osman Pasha, after making a fruitless sortie, was compelled to surrender.

PLIMSOLL, SAMUEL, *b.* at Bristol, 1824, *d.* 1898; did much to improve the lot of our sailors. He got the Merchant Shipping Act passed in 1876, by which a ship is prevented from sailing if deemed unsafe by the Board of Trade, and a mark (known as the Plimsoll mark) is affixed to every British ship below which she must not sink in the water when loaded.

PLINY (1) "The Elder," *b.* in Italy, 23, *d.* 79 A.D., a celebrated Latin writer. His principal work is a Natural History, in which he treats of many subjects, including Geography, Medicine, Astronomy and Botany. Pliny lost his life during the eruption of Vesuvius. He ventured too far up the mountain in his desire to observe more closely the phenomena, and was destroyed. (2) "The Younger," *b.* 62, *d.* 113 A.D., the nephew and adopted son of the elder Pliny, was a distinguished Latin writer. The only works extant are a number of epistles, which throw considerable light upon the history of the period.

PLOUGH MONDAY, the Monday after Twelfth Day, and the end of the Christmas holidays. On this day, in old times, the labourers would get out their ploughs, with which they went from door to door soliciting contributions for their merry-making.

PLUMBAGO. See *Blacklead.*

PLUSH, a kind of cloth which resembles velvet, but possesses a longer pile or nap. Silk plush is made in large quantities at Lyons. In addition to silk, cotton, wool, goat's hair and eider-down are often used in the manufacture of plush. It is used for hats, various ornamental articles of wearing apparel for ladies, and for breeches.

PLUTARCH, *b.* about 46 A.D., was a celebrated Greek historian. His best known work is his Lives of Famous Greeks and Romans. These are forty-six in number, and are arranged for the sake of comparison in pairs, one Greek and one Roman. They form a most valuable addition to the historical literature of the world, since most of the writings from which Plutarch obtained his facts have since been lost.

PLUTO, HADES, or **DIS,** in classical mythology, the brother of Jupiter and Neptune, and the overlord of the abode of the dead. He is represented as a venerable old man carrying a two-pronged fork, and having a three-headed dog (Cerberus) at his feet.

PLUTUS, in classical mythology, the god of riches. He was struck blind by Zeus in order that he might distribute his gifts blindly, to good and bad alike.

PLYMOUTH, a seaport and important naval station, is situated upon Plymouth Sound, at the mouth of the Plym. With the adjoining towns of Devonport and Stonehouse it forms "The Three Towns." The naval dockyard is situated at Devonport; at Stonehouse the Victualling Yard and Naval Hospital, and at Plymouth the Citadel. Plymouth Sound is protected by a breakwater which is nearly a mile long. (For population, etc., see p. 902.)

PLYMOUTH BRETHREN, a religious sect founded at Plymouth, about 1830, by John Darby and others. Their beliefs are similar in some respects to those of the Calvinists. They do not possess salaried ministers, they baptise all their members, partake of the Lord's Supper every Sunday, and in their meetings any member of the congregation is permitted to speak or offer prayer. There are at least three distinct branches of the *Brethren*, as they call themselves. The sect possesses followers in most of the British Colonies, in the United States, and in France and Switzerland.

PNEUMATIC DESPATCH, the name given to the transmission of telegraph forms, etc., by means of compressed air. It is used in London to despatch forms from the central to the suburban offices. The conveying pipe is of lead, and possesses a diameter of 2½ inches. When the "carrier" or case has been placed in the tube, compressed air is admitted behind it, whilst the air is exhausted at the other end, and thus a velocity of over 25 miles an hour is obtained. There are about 60 miles of these tubes in England, 40 miles of which are in London. The system has been used to transmit mailbags from the General Post Office, London, to Euston Station. The system is also in use in various places of business to despatch bills, change, etc., from one part of a building to another.

PNEUMATIC TYRES are in general use for the wheels of bicycles, motor cars, and other vehicles. Their advantage lies in the fact that the motion of a vehicle fitted with these tyres is much smoother than that resulting from any other method. This is due to the perfect elasticity of the air with which the tyres are filled. The tyre consists generally of two separate tubes. The inner tube, composed of very flexible rubber, acts as the air chamber. The outer tube is of rubber applied to a strong canvas backing. It is really a circular band of the material with recurved edges. When the inner tube has been fitted to the wheel this outer band is placed over it, and the curved edges fit into the inwardly curving edges of the rim. The filling of the inner tube with air causes it to press on the outer tube, brings the edges of the tyre and rim in close contact, and retains the whole in position.

PO, the longest river of Italy, rises in the Alps and, after a course of about 400 miles through the fertile plain of Lombardy, enters the Adriatic Sea. Owing to the quantity of mud brought down, the level of the bed is generally above that of the surrounding plain, and artificial embankments have been constructed. The principal tributary is the Ticino, and the chief towns on the Po are Cremona and Turin.

POCAHONTAS, an Indian maiden, the daughter of a chieftain of Virginia. She displayed great friendliness towards the early English settlers, and eventually married one named Rolfe. She afterwards came to England and died at Gravesend, 1617. (See *Smith, Captain.*)

POE, EDGAR ALLAN, *b.* at Boston, Massachusetts, 1809, *d.* 1849, a celebrated American poet and writer. His writings are characterised by wonderful imagination, but his life was completely spoiled by his vices. He was addicted to gambling and drinking, and he died from the results of a drunken carouse. His best known poem is "The Raven." "The Fall of the House of Usher," and "The Murders in the Rue Morgue," are characteristic examples of his prose works.

POETRY. It is almost impossible to obtain a satisfactory definition of poetry, but the principal differences between it and prose are as follows:—It employs figurative language far more frequently, and makes use of archaic words, grammatical constructions, and inversions in the order of words which are not permissible in good prose. It is metrical, each verse or line containing a definite number of "feet," in which the accented syllables occur in a particular order. It is frequently rhymed, but rhymes are not an essential characteristic. Poetry is of the following kinds:—Dramatic, Epic, Lyric, Satirical, Didactic, Pastoral, and Elegiac.

POETS' CORNER is situated on the eastern side of the south transept of Westminster Abbey. It contains memorial tablets to many of our greatest poets, including Chaucer, Shakespeare, Jonson, Spenser, Milton, Burns, Browning, and Tennyson. There are also buried in the Poets' Corner, in addition to some of the above, the following writers:—Macaulay, Samuel Johnson, Dickens, and also the musician Handel.

POGROM, a Russian word meaning "desolation, devastation," applied to a massacre by the mob, such as those recently perpetrated on the Jews in certain Russian cities, apparently at the instigation of public officials.

POISONOUS PLANTS. See *Med. Dict.*

POITIERS, a town in the south-west of France, was formerly the capital of Poitou. It was the scene of a battle, 1356, in which the Black Prince defeated King John II. of France. It afterwards became a stronghold of the Huguenots; population 40,000.

POLA, the principal naval station of Austria, is situated on the coast of the Adriatic Sea, in the province of Istria; population 45,000.

POLAND, the name now given to a province of Russia, was during the Middle Ages one of the most powerful states of Central Europe. It then included a large portion of what is now Russia, a portion of Eastern Prussia, and the province of Galicia in Austria. Poland appears as an important state about the 10th century, and reached the height of its power in the 13th and 14th centuries. The capital was Cracow and afterwards Warsaw. Its destruction was caused largely by internal political and religious dissensions. The partition of Poland occurred at the end of the 18th century, its territory being divided between Russia, Prussia, and Austria. This was not accomplished without strenuous opposition on the part of the Poles, under the leadership of Kosciusko. Russian Poland, although in a chronic state of political dissension and discontent, is one of the most prosperous provinces of the Empire. The chief towns are Warsaw, the capital, and Lodz, a town of one street, six miles in length, on each side of which are hundreds of cotton-mills. Area 9,000 square miles; population about 9½ millions.

POLAR EXPLORATION. Refer to *Index*.

POLAR LIGHTS. See *Aurora Borealis*.

POLAR REGIONS. See *Arctic* and *Antarctic*.

POLDER, the name given in Holland and Belgium to a piece of reclaimed marsh land, which lies below the level of the sea. A polder is surrounded by a stone dyke and the water is pumped from it by machinery, which is driven by a windmill.

POLECAT, an animal of the weasel family, found in the temperate parts of Europe. During the day it sleeps in its hiding-place, sallying forth at night to plunder dove-cots or hen-houses, or to seek its prey in a rabbit warren. It destroys all the small animals that come in its way. Should it enter a hen-house not a hen would be left alive in the morning. It is notorious for its fetid smell. See *Ferret*.

POLE STAR, the nearest prominent star to the north pole of the heavens, a point vertically above the north pole of the earth. The pole star is the brightest star in the constellation *Ursa Minor* (Little Bear), and its mean distance from the actual pole is at present about 1½ degrees. Owing to the precession of the equinoxes this distance varies, though the change is very slow.

POLICE. The modern police force in England was established by Sir Robert Peel, 1829. The arrangement for maintaining order previous to that date was in the hands of the sheriffs, and was of a most inadequate character. The police of the various counties of England are under the control of a joint committee, elected partly from the members of the County Council and partly from the justices of the peace of the county. The Metropolitan Force is under the direct control of the Home Office. Ireland possesses two distinct forces, the Dublin Metropolitan Force and the Royal Irish Constabulary, the latter being a semi-military organisation. The total number of police in England and Wales is about 40,000. Refer to "Police" in *Index*.

POLITICAL ECONOMY. This science has been defined in various ways. According to John Stuart Mill it is the science which treats of the nature of wealth, and the laws which govern its production and distribution. Of the many works written on the subject, Adam Smith's "Wealth of Nations," and John Stuart Mill's "Principles of Political Economy," deserve special mention.

POLITICS, the science of national government, which treats of the principles that should underlie the regulations for securing order, individual liberty, and the general interests of the commonwealth. It may be divided into Home or Domestic politics and Foreign politics. The latter concerns itself with the "Balance of Power" amongst the important states of the world with a view to the maintenance of peace and national independence. The word is also used to denote the opinions of an individual upon the various prominent questions affecting the welfare of the nation.

POLLARDING, the name given to the operation of lopping off the poll or top from a tree. The trees most commonly treated in this way are the willow and the poplar, and when so treated they are known as *pollards*.

POLLUX. See *Castor* and *Pollux*.

POLO, MARCO. See *Marco Polo*.

POLYANDRY, the state of marriage in which a woman possesses more than one husband. Cæsar tells us that it was a common practice among the Britons, and travellers in uncivilised countries in all ages have observed the same thing.

POLYCARP, *b.* in Asia Minor, 69, *d.* 155, one of the most famous of the early Christian Fathers. Polycarp was a disciple of the apostle John, and suffered martyrdom at Smyrna, at which place he had been head of the Church for many years. An "Epistle to the Philippians" written by him is still in existence.

POLYGAMY, the state of marriage in which a man possesses more than one wife. It is commonly practised in eastern countries, and is recognised by the Mohammedan religion. The Old Testament does not prohibit polygamy, and both the patriarchs and the kings of Judah and Israel practised it. In the time of Christ it seems, however, to have disappeared amongst the Jews. The laws of all European countries treat polygamy as a crime, and the only sect which has advocated it of recent years is that known as the Mormons, who have their headquarters at Salt Lake City, Utah. In 1890 the Government of the United States intervened, and made the practice illegal.

POLYNESIA, the name given to the whole of the islands of the Pacific Ocean which lie between the meridians 110° W. and 180° W. There are many groups, of which the most important are the Samoan, Tonga, Sandwich or Hawaiian, Ladrone, Caroline, and Marquesas groups. The total area of Polynesia is about 11,000 square miles, and the population, which is mainly of Malay extraction, 265,000. The islands are, generally speaking, under the protection either of Germany, France, or Great Britain.

POLYPHE'MUS, in classical mythology, the son of Poseidon (Neptune), and the chief of the Cyclops. He was of great size and possessed but one eye, which was placed in the middle of his forehead. Ulysses, when wrecked upon the coast of Sicily, in which island Polyphemus dwelt, was confined in a cave by the monster, from whom he contrived to escape by making him drunk and burning out his single eye while he was in profound sleep.

POMEGRANATE, the fruit of a tree which grows in northern Africa and southern Europe. The fruit, which is about the size of an orange, contains a large number of reddish seeds, each contained in a separate cell. It has never become a popular fruit in this country. The rind contains tannin, which is used in the manufacture of Morocco leather.

POMPADOUR, *b.* in Paris, 1721, *d.* 1764, was the most celebrated of the mistresses of Louis XV. She was of humble birth, but possessed remarkable beauty. From 1745 until her death she exercised in French politics enormous influence, the evil effects of which can scarcely be overrated.

POMPEII, a town of Italy, which was overwhelmed by volcanic ashes during an eruption of Vesuvius, 79 A.D. It is situated at the foot of Mount Vesuvius, on the shore of the Bay of Naples. Excavations were commenced at Pompeii, 1748, and since 1870 have been carried on with great regularity, so that now a large portion of the town has been exposed to view.

POMPEY, surnamed "The Great," *b.* 106, *d.* 48 B.C., was one of the greatest Roman soldiers. He saw much service in Italy, Greece, and Asia Minor, and met with almost uninterrupted success. In 62 B.C. he formed, with Cæsar and Crassus, the first triumvirate. Whilst Cæsar was engaged in Gaul, Pompey, as the leader of the aristocratic party, was almost absolute ruler of Rome. On the outbreak of the civil war between the two rivals, Pompey fled to Brundisium, and thence to Greece. He was defeated at Pharsalia, 48 B.C., by Cæsar, and fled to Egypt, where he was foully murdered by order of Ptolemy XII.

PONDICHERRY, the capital of the French possessions in India, is situated on the east coast of that country, about 90 miles south of Madras. It was acquired by the French in 1672, and has been captured by the British on three occasions; it was finally restored in 1816; population about 50,000.

PONTIFICAL, a book which contains the various services of the Roman Catholic Church. In addition to the prayers to be recited, there is also in the pontifical a minute description of the ceremonies to be observed. The present pontifical was drawn up by Pope Clement VIII., 1596.

PONTINE MARSHES, a marshy district forming part of the Campagna di Roma, which is situated between Rome and the coast. Efforts have been made without success to drain the district, and at the present time it is used almost entirely as a grazing ground for cattle.

PONTIUS PILATE, Roman governor ("procurator") of Judæa from 26 to 36 A.D. His official residence was at Cæsarea, but he generally visited Jerusalem at the great feasts. He had little scruple about offending the Jews' religious susceptibilities, and this, together with his exactions, caused many outbreaks, the last of which brought about his recall. In all probability he committed suicide.

PONTOON, a sort of boat, which is used to support a temporary military bridge. In the British army the pontoon used is a flat-bottomed boat, which is made in two or three sections to facilitate transportation.

POONA, the capital of a district of India of the same name, is situated on the western Ghats, about 80 miles south-east of Bombay, at an altitude of 2,000 feet. It is the seat of the Bombay government during the hot season, and an important military centre; population 110,000.

POPE, ALEXANDER, *b.* in London, 1688, *d.* 1744, a celebrated English poet. He spent many years of his life at Twickenham. Pope was a master in the construction of the heroic couplet, and his poems are written in this metre. For example—

> Honour and shame from no condition rise.
> Act well your part, there all the honour lies.

His works include "The Dunciad," "Essay on Criticism," "The Rape of the Lock," "Essay on Man," and translations of the "Iliad" and "Odyssey."

POPE JOAN. (See *Joan, Pope*)

POPE, THE, is the title bestowed upon the Bishop of Rome, the Head of the Roman Catholic Church. The members of this Church regard the Pope as the successor of Saint Peter, and as Christ's Vicar on earth. In 1870 the Vatican Council, composed of Roman Catholic bishops from all parts of the world, decreed the "Infallibility of the Pope," whereby his definition of a doctrine of faith or morals is held to be necessarily true and binding on all Christians. Since the 11th century, the election of Pope has been in the hands of the cardinals, who used to assemble in the town at which the death of the Pope has occurred, and proceed to elect his successor. The election now takes place at the Vatican, the Pope's official residence. When the election occurs, all persons but the cardinals and a few officials are excluded from the building; the cardinals are isolated in small compartments and a ballot is taken daily, in absolute silence, until some one person obtains a two-thirds majority of the votes cast. The elections are occasionally very protracted; that which ended in the elec-

tion of Pius VII., 1799, was spread over six months. The Pope in the Middle Ages exercised considerable temporal power in Italy, but in 1870, when that country was united under one king, he was deprived of his temporal kingdom. Since that date the Popes have refused to recognise the king of Italy, and of their own free will have remained within the Vatican walls from their election until death.

POPINJAY, the name originally of a parrot, but commonly used in England during the Middle Ages, as the name of the mark or target set up in archery contests, and consisting of a piece of wood ornamented with feathers, wool, etc.

POPISH PLOT. See *Oates.*

POPLIN, a fabric made with threads of silk one way, and worsted the other, cotton or flax replacing the silk in the cheaper kinds. Introduced into Ireland by French refugees, the manufacture took root in Dublin, but the demand for poplin is very fluctuating. Figured poplins are very effective for decorative purposes.

PORCELAIN. See *Pottery.*

PORPOISE, a mammal belonging to the same family as the dolphin, and often seen off our coasts. It is about 5 or 6 feet long, and when present is visible at intervals, being obliged to come to the surface to breathe. Porpoises are often seen in pursuit of shoals of herring, pilchard, or mackerel, among which they commit great havoc.

PORT ARTHUR is situated at the southern extremity of Liao-Yang Peninsula, upon a harbour which is free from ice the whole year round. It was taken from the Chinese by the Japanese in 1894, but they were compelled to relinquish the prize by a coalition of Russia, Germany, and France. In 1898 Russia took possession of the place and made it one of the strongest fortresses in the world. It was besieged by the Japanese in 1904, and taken after a terrible struggle January 1st, 1905. (See *War, Russo-Japanese*).

PORTCULLIS, a heavy iron grating, which was formerly used as a gate to a castle. It was so constructed that it could be raised or lowered, and it was provided along its lower edge with spikes, which penetrated the ground when it was dropped.

PORTE, SUBLIME, the name applied to the Government of the Ottoman Empire, or to the Empire itself. It is a French translation of the official Turkish name, "Babi Ali," literally "the high gate." The name derives its origin from the fact that in former times justice was administered at the gates of the palace.

PORTLAND CEMENT, an artificial product so called because it resembles Portland stone in colour. See *Cement.*

PORTLAND, ISLE OF, a peninsula which is situated on the coast of Dorset. It contains enormous quantities of excellent building stone, and is the site of a convict prison. The breakwater, which is the largest of its kind in England, is in two portions, the inner being about 650 yards in length and the outer over 2,000 yards; population 15,000.

PORTLAND VASE, a famous vase which was discovered in Rome, 1630. It is of blue cut glass and stands ten inches in height, and it derives its name from the fact that it was purchased by the Portland family and presented to the British Museum. In 1845 it was smashed by a madman, but it has since been cleverly repaired.

PORT MAHON, a naval seaport of the island of Minorca. It is situated upon a magnificent harbour, and is used by the Spanish authorities as a quarantine station; population 18,000.

PORTO RICO, the most easterly of the group of West Indian Islands known as the Greater Antilles, has been, since 1898, under the protection of the United States. Previous to that date it was a Spanish possession, and during the 19th century the scene of almost continual rebellion. The productions include coffee, sugar, and tobacco. Area 3,500 square miles; population nearly a million.

PORT ROYAL, a well-fortified naval station in Jamaica, on the end of the spit of land which, jutting out to the west, forms the harbour of Kingston. A great earthquake in 1692, and hurricanes and conflagrations since, have reduced it to a mean place of 1200 inhabitants.

PORT SAID is situated at the northern end of the Suez Canal. It is a port of call for steamers, and an important coaling station; population 37,000.

PORTSMOUTH, the principal naval station, and the strongest fortress in the British Isles, is situated on an island off the coast of Hampshire. It possesses a naval dockyard and a good harbour. Spithead, which lies between the town and the Isle of Wight, forms a magnificent anchorage for the ships of the navy. (For population, etc., see p. 902.)

PORTUGAL occupies the western portion of the Iberian Peninsula. The country is generally mountainous, the only considerable tracts of plain being towards the south. Portugal was, during the 15th and 16th centuries, one of the greatest maritime countries of Europe; but since then, owing to the indolence of its inhabitants, it has fallen from its high position. It exports wine, sardines, cork, fruits and copper. The government, which is a limited monarchy, has its headquarters at Lisbon, and the only other town of importance is Oporto. Area 35,000 square miles; population about 5½ millions.

PORT WINE, a rich, heavy wine, is exported from Portugal. Its colour varies according to its age, from red to a tawny brown. In the 18th century, when the supplies of French wine were shut off from this country, port was the fashionable drink, but its popularity has declined of recent years. It is still the wine commonly prescribed for invalids. Much of the cheap port is merely crude spirit coloured with the juice of elder-berries.

POSEIDON, in Greek mythology, the lord of the seas, corresponding to the Roman god Neptune. He was the son of Saturn and the brother of Zeus and Pluto. He is represented as a venerable old man carrying a trident, and usually accompanied by a dolphin or a horse. His palace was in the depth of the sea, over which his chariot was drawn by horses with brazen hoofs and golden manes. The waves became calm at his approach, and around his chariot gambolled the denizens of the sea.

POSITIVISM, or **POSITIVE PHILOSOPHY,** the system of Auguste Comte, a French philosopher. He may be said to have prepared the way for the reconstruction of society after the great upheaval of the French Revolution. Any one comparing the lot of a workman in 1906 with that of his fellow of 1806 cannot fail to observe the immense superiority of the former. The teaching of Comte prepared the way for the recognition of the fact that capital must do its duty by labour, and labour must acknowledge a duty to the society which provides it with work. His attempted religious system was a failure from the first, but it made the way clearer for a right conception of man's duty to man. See *Comte, Auguste.*

POSSE COMITATUS, the "power" or "force of the county." It consists of all men between the age of fifteen and seventy, who may be called on by the sheriff to aid in putting down riot, or in assisting him to execute a writ.

POSSET, a hot drink taken on going to bed, generally for colds. It is composed of hot milk curdled with wine, strong ale, or vinegar, spiced and sweetened.

POSTAL UNION, an association embracing all the chief countries of the world, whose aim it is to consider and simplify postal tariffs and regulations as between the different countries. Its first meeting was in 1874, and it has done good work in unifying charges and facilitating the carriage of postal matter.

POST-OBIT BOND. See *Commercial Dictionary.*

POSTULATE, an assumption which must be admitted before argument is possible, e.g., that the human will is free, before arguing on the claims of duty.

POTATO, a valuable tuber-bearing plant which is a native of America. It was introduced into Europe during the 16th century, and is now very extensively cultivated. It is used as a foodstuff, and from it starch and alcohol are obtained. The extraction of alcohol from the potato is an important industry in Germany. Potatoes repeatedly grown on the same ground from their own buds develop disease. Enormous prices are often paid for new sorts obtained directly from the seed of an old plant.

POT-POURRI, a mixture of sweet-smelling herbs, placed in a vase or box, and intended to diffuse a pleasant aroma through a room. It is also the name given to a sort of stew in which meat and vegetables are cooked together; and lastly to a medley of musical tunes.

POTSDAM, a town of Prussia, is situated some 16 miles south-west of Berlin. It contains several palaces, including the Sans-Souci and Marble Palaces, all of which are the property of the reigning family of Prussia; population 60,000.

POTTER, PAUL, *b.* in Holland, 1625, *d.* 1654, a famous Dutch animal painter. The Royal Gallery at the Hague contains several of his works, notably that known as "Paul Potter's Bull."

POTTERIES, a district of North Staffordshire, known as "The Five Towns," in which the pottery industry is carried on. These towns are Stoke, Hanley, Burslem, Longton and Newcastle.

POTTERY. The term pottery is applied both to articles made chiefly of clay and to the processes of manufacture. The actual substances used vary according to the kind of ware to be made, but they are generally a mixture of clay and sand flint or felspar. In the manufacture of porcelain, kaolin or china-clay is the chief ingredient. The required mixture having been made, it is then turned into the right shape either by moulding or by working on a lathe. The shaped article is then dried and baked into a sort of "biscuit-ware," which is hard but porous. Upon this ware the pattern is now printed or painted, and the ware thus decorated is again placed in the furnace to fix the colours. It has yet to be glazed or enamelled. Common pottery is often glazed whilst it is being baked. Salt is thrown into the vessel holding the pottery and is decomposed, the sodium combining with the silica and forming a fairly satisfactory glaze. In the case of porcelain, the glazing is done by dipping the article into a mixture of water and ground felspar. The chief centres of the porcelain industry in England are Worcester and Derby. Coalport is also still engaged in the manufacture.

POTWALLOPERS, a certain class of voters in certain English boroughs before

the Reform Act of 1832. The term is derived from *pot* and *wallop*, "to boil," the right to vote being restricted to such as cooked their own food in a fireplace of their own.

POUNDS, JOHN, a shoemaker, who may be considered the founder of the ragged-school. He lived at Portsmouth, and for twenty years (1820–1840) taught the slum children, as he worked. His example led to the opening of other similar schools, and eventually to the formation of the Ragged School Union.

POUND STERLING. The word "sterling" is said to be derived from "Easterling," a name for the Germans who traded so much with England in the 12th and 13th centuries. Their money was of great purity; hence it was usual for the seller to stipulate for a payment in pence or pounds "sterling," and the word has survived as the epithet for standard money.

POUSSIN, NICHOLAS, *b.* in Normandy, 1594, *d.* 1665, a celebrated French artist. He spent the greater part of his life in Rome, but during a short time spent in Paris as court painter he decorated the gallery at the Louvre.

POWELL, BADEN. See *Baden-Powell.*

POYNINGS' LAW, or Statute of Drogheda, an Act of the Irish Parliament passed in 1495, when Sir Edward Poynings was king's deputy of Ireland. The law enacted that all laws in force in England should also be in force in Ireland; that the Irish parliament should not sit without the consent of the King of England and his council; and that it should take no bill into consideration before it had been approved by the English council.

POYNTER, SIR EDWARD JOHN, *b.* at Paris, 1836; president of the Royal Academy and Director of the National Gallery. He first exhibited in 1861. "Israel in Egypt." "The Catapult." "The Ibis Girl," and "Atalanta's Race," are some of his chief pictures. He has worked largely in water-colours.

PRAGMATIC SANCTION, an agreement made by a sovereign with the neighbouring states regarding the succession after his death. It is used with particular reference to an agreement made between Charles VI. of Austria and the various European powers, by the terms of which his daughter Maria Theresa was to succeed him. On his death, the Elector of Bavaria and Frederick II. of Prussia attempted to obtain possession of some of the Austrian territory, and the Seven Years' War ensued.

PRAGUE, the capital of Bohemia, is situated upon the Moldau, a tributary of the Elbe. It is the centre of a large manufacturing district, in which are produced sugar, beer, brandy, porcelain, glass and all kinds of textiles; population 385,000.

PRAXIT'ELES (el-es), one of the greatest of Greek sculptors, probably flourished about 400 B.C. Examples of his work may still be seen at the Louvre, at the Vatican, and in Florence, but his most celebrated work, "Aphrodite of Cnidus," was destroyed in a fire at Constantinople during the 6th century.

PRAYING-WHEEL, a mechanical contrivance to which prayers or religious writings are attached. It takes the form of a revolving wheel or of a cylinder which rotates horizontally on a pivot. Among Buddhists, especially those of Tibet, each revolution of the praying-wheel is considered equivalent to an uttered prayer and is counted to the credit of the person who turns the wheel.

PRECEDENCE. Refer to *Index.*

PRECESSION, a going forward, or before something. It is usually applied in astronomy to the occurrence of the equinoxes each year a little *before* the point on the ecliptic where they fell the previous year. The entire revolution of the equinoxes takes about 25,000 years.

PRECIOUS STONES. See *Gems.*

PREDESTINATION. "The doctrine of Calvin and the Calvinists is that from all eternity God predestinated a certain fixed number of individuals, irrespective of anything in them, to final salvation and glory; and that all others are either predestined to damnation, or, at least, so left out of God's decree to glory, that they must inevitably perish." (Dr. Harold Browne on Art. xvii. in the Prayer Book.)

PRESBYTERIANISM. Refer to *Index.*

PRESCOTT, WILLIAM HICKLING, *b.* at Salem, Mass., 1796, *d.* 1859, a famous American historian. His works on "The Reign of Ferdinand and Isabella," "The Conquest of Mexico," and "The Conquest of Peru," based largely on original documents obtained from Spain, are lucidly written, and frequently attain a lofty grandeur of style. During the whole of his literary career he was forced to employ a reader to assist him, owing to partial blindness from an accident received while an undergraduate at Harvard.

PRESIDENT OF U.S.A., THE, is elected for a term of four years by presidential electors, who are themselves elected by the people of the various States, the number of presidential electors from each State coinciding with the number of Senators and Congressmen representing that State. The president is commander-in-chief of the army and navy; he is empowered to grant reprieves and pardons, to make, with the concurrence of a two-thirds majority in the Senate, foreign treaties, and to suggest new laws; he has, moreover, in his hands the appointment to numerous state offices. (For list of "Presidents" refer to *Index*).

PRESS-GANG. From King John's reign to that of William IV. it was customary, during war-time, to press men by force into the army or navy in order to increase the fighting strength. Bodies of men, known as press-gangs, each under the command of a lieutenant, were empowered to seize and enlist suitable men, *nolens volens*. From 1688 onwards this system was chiefly employed on behalf of the navy. Often the press-gang went down to some great seaport and boarded all the merchant ships lying at anchor, in order to collect sailors for the royal navy. It was not unusual for the sailors of some merchant vessel, just returning home after a long voyage, to be forced on board a man-of-war waiting in harbour to make up its complement.

PRESS, LIBERTY OF. Refer to *Index.*

PRESTER JOHN. During the Middle Ages there was a belief current in Europe that a Christian king who had styled himself Presbyter or Prester John, governed vast possessions in Central Asia. About 1165, a letter reputed to have been sent by him to Manuel Commenus, emperor of the East, circulated through Europe. Wonderful tales were told of his wisdom and the splendours of his court, but his identity has never been established. In the 14th century, the Christian king of Abyssinia became confounded with this fabulous potentate.

PRESTON, a town at the mouth of the Ribble, Lancashire. It is an important railway centre, and the dredging of the river has given a strong impetus to its growing shipping-trade. Cotton goods are manufactured and coal exported. Here, in 1648, the Scottish royalists were crushed by Cromwell; the town gave its support to the Old Pretender in 1715, and to the Young Pretender in 1745. (For population, etc., see p. 902.)

PRESTONPANS, a small town near Edinburgh, where, in 1745, Prince Charles Edward, the Young Pretender, defeated a British force under General Cope.

PRESUMPTIVE HEIR, the person who, should the existing holder of property die, would at once succeed, but whose title may be nullified by the birth of a child to the existing possessor. Thus a brother may lose his rights by the birth of a child to his elder brother, or a daughter by the birth of a son to her parents.

PRETENDER, THE OLD, James Francis Edward, *b.* at St. James's Palace, 1688, *d.* 1766, son of James II. and Mary of Modena. When James II. fled from England his son was sent to France, and there brought up under the protection of Louis XIV., by whom he was proclaimed king of England on the death of his father. His adherents, known as Jacobites, called him James III., but he is usually styled *The Old Pretender*, a word meaning "Claimant." In 1715 a rebellion was raised in Scotland and the north of England on his behalf, but it was easily suppressed.

PRETENDER, THE YOUNG, Charles Edward Stuart, *b.* at Rome, 1720, *d.* 1788, son of "the Old Pretender" and grandson of James II. of England. In 1745 he raised a rebellion in Scotland and claimed the English throne on behalf of his father. His genial personality gained him many adherents in Scotland. He defeated a royal army under General Cope at Prestonpans, and marched his forces into England. He got as far south as Derby, and then finding himself unsupported by the English he reluctantly retraced his steps. He was followed by an army under the Duke of Cumberland, and totally defeated at Culloden Moor in 1746. After exciting adventures he escaped to the Continent and settled at Rome, where he died prematurely from the effects of alcohol.

PRETORIA, the seat of the government of the Transvaal Colony. It was founded by the Boers in 1855, and named after Pretorius, the first president of the Transvaal Republic. It was entered by the British troops under Lord Roberts, 5th June, 1900, and was the head-quarters of the invading army till the close of the war. It is built on the rectangular system, and has fine government buildings.

PRETORIAN GUARD, a powerful force of picked Roman soldiers, formed by the Emperor Augustus Cæsar for his personal protection and for the maintenance of his power. In time this body became so powerful in the State as to depose and set up emperors almost at will. It was suppressed by the Emperor Constantine about 312 A.D.

PRIAM, in Greek legend, was the last king of Troy. By his wife, Hecuba, he had numerous children, of whom Hector, Paris, and Cassandra were the most famous. In the great siege of Troy by the Greeks under Agamemnon, Priam fell with the city.

PRIBYLOV ISLANDS, a group of four small volcanic islands in Behring Sea. Their area is only 50 square miles, but their importance lies in the fact that they are the breeding ground of the fur-seals, thousands of which are here killed annually.

PRIDE'S PURGE. Colonel Pride was commissioned by a council of officers of the Parliamentary army to station himself outside the Houses of Parliament and prevent the entrance of all Presbyterian members opposed to taking extreme measures with Charles I. By this means the appointment of a council to try the king was successfully passed, 1648.

PRIESTLEY, JOSEPH, *b.* near Leeds, 1733. *d.* 1804, an English scientist best known for his production of oxygen from

the red oxide of mercury in 1774. For many years he acted as a Nonconformist minister. In 1791 his openly expressed sympathy with the French Revolution led to his house being wrecked by a mob. From 1794 to his death he resided in the United States.

PRIMARY COLOURS, the name given to the colours produced by passing sunlight through a refracting and dispersing medium such as a prism. If the refracted rays are allowed to fall on a screen, a band of seven colours—violet, indigo, blue, green, yellow, orange and red—is seen. Red, green, and violet-blue, are regarded by some authorities as the primary colours, because from them the others may be obtained. But in painting the primary colours are red, blue, and yellow, as the other colours can be obtained from them. It is strange that colours due to mixture of coloured lights are different from those due to mixture of the corresponding paints; thus, blue and yellow light produce a dirty white, whereas blue and yellow paints produce green.

PRIMOGENITURE, in law, is the name specially applied to the principle by which the real estate of the parent descends, in the absence of a will, to the eldest son, to the exclusion of other members of the family. In feudal times this system served its purpose in keeping up the wealth and power of noble families, and facilitated the operation of feudal laws.

PRIMROSE, ARCHIBALD PHILIP, Earl of Rosebery, *b.* 1847, a prominent British statesman. He gained a name in the House of Lords as a skilful and polished debater, and was first Commissioner of Works in Gladstone's ministry, 1884–5. He served under Gladstone as Foreign Secretary in 1886 and 1892–4, and succeeded him as Premier, 1894–5.

PRIMROSE DAY, April 19th, the anniversary of Lord Beaconsfield's death, when his statue in Parliament Square, Westminster, is decorated profusely with primroses, his favourite flowers, in commemoration of his services to the empire. (See *Disraeli.*)

PRIMROSE LEAGUE, a political organisation, in which ladies play an important part, for the furtherance of the imperial policy which formed so prominent a feature in the statesmanship of Benjamin Disraeli, Earl of Beaconsfield; it was founded in 1884.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, lying in the Gulf of St. Lawrence, and separated from New Brunswick by Northumberland Strait. Its surface is undulating and very fertile, plentiful crops of wheat, barley, oats, and vegetables being produced. Fruit, especially apples, is successfully grown. The lobster, mackerel, cod, and hake fisheries are very productive. Area 2,184 square miles; population 104,000; capital Charlottetown.

PRINCE IMPERIAL. See *Napoleon, Eugène Louis.*

PRINTING, THE INVENTION OF. Printing from fixed type, which is really a species of engraving, seems to have been used to a limited extent in very ancient times. The invention of printing from movable metal types is claimed for two printers—Laurence Coster, of Haarlem, and John Gutenberg, of Mainz. The latter set up a printing press at Mainz about 1450. Printing was practically confined to Mainz till the sack of the town in 1462, dispersed the printers and led to the more general adoption of the art. William Caxton, the first English printer, learnt the secret while resident in the Low Countries, and set up a printing press at Westminster in 1476. Gothic type was used by English printers till 1518, when it was superseded by the more readable Roman type now employed. The Germans, however, still use the Gothic type.

PRIOR, MATTHEW, *b.* 1664, *d.* 1721, one of the foremost of English minor poets. In conjunction with Charles Montague, afterwards Earl of Halifax, he produced, in 1687, "The Town Mouse and The Country Mouse," a parody of Dryden's "Hind and Panther." In 1690 he began a diplomatic career, serving as Secretary to the English Embassy at the Hague, and later in a similar position at Paris. For his share in negotiating the unpopular treaty of Utrecht, he was sentenced, in 1714, to two years' imprisonment. His numerous short poems, on which his reputation chiefly rests, are light and graceful in style, and display much polished wit.

PRIVATEER. See *Marque, Letters of.*

PRIZE COURT. A court appointed by a country at war to adjudicate on questions relating to the capture of vessels carrying what is alleged to be "contraband of war." In England, the Judge of the Court of Admiralty is appointed president of the prize court.

PRIZE-FIGHTING, or **BOXING.** "P.R." was known to every one as *Prize Ring*, when prize fighting was in vogue and a fight for the championship was patronised by the highest in the land. The ring, so-called, was really a square of 24 feet, enclosed by two ropes, 2 and 4 feet from the ground. Each combatant had his own corner of the square, to which he retired between the bouts, and where he was attended by his seconds with sponge and bottle. The battle ended when one of the combatants failed to come to scratch after half-a-minute's rest. The scratch was a line drawn in the middle of the ring which the combatants had to toe before beginning or renewing the fight, and where they shook hands prior to the first round. Every endeavour was made to secure good temper and fair play; in other words, a strict observance of the rules of the ring, one of which forbade hitting below the belt, represented by a coloured handkerchief round the waist. The common expressions "to throw up the sponge" and "to come up to scratch" witness to the influence of the ring in times past. The sport first came into prominence about 1715, and attained its highest popularity a century later, when Jack Shaw, the mighty life-guardsman, was the hero of the day. After the retirement of Tom Spring, in 1824, among the most famous champions were "Gentleman" Jackson and Cribb, whose monumental tombs attest their former greatness: Jackson's, in Brompton Cemetery, London, and Cribb's in a churchyard at Woolwich; and last, not least, Tom Sayers, whose fight with Heenan was regarded as a national event, 1860. Sayers was a light Sussex man, 5 feet 8 inches in height; Heenan, a huge American, 5 or 6 inches taller. It was a fight between skill and strength. It lasted over 2 hours, and the later rounds were fought with the American practically blind and the English champion one-handed. Eventually the fight was interrupted. Sayers died 5 years later, and was followed to the grave in Highgate Cemetery by a countless throng of admirers. After the match between King and Heenan, in which the latter was nearly killed, prize fights, that is, contests with the naked fists, were declared illegal (1863).

PROCRUS'TES, in Greek legend, a robber of plausible tongue who waylaid travellers and invited them to his stronghold to share his hospitality. The guest on retiring to slumber was placed on a bed, which he was made to fit by having his limbs stretched or lopped according as they were too short or too long. He was slain by the Greek hero, Theseus. "Procrustean bed" and "Procrustean process" have become metaphorical expressions.

PROCTOR (shortened from L. *procurator*), one who acts for another. In the Law Courts the proctors have almost disappeared, their places being taken by solicitors. The King's Proctor acts in divorce cases to prevent a decree being made absolute that has been obtained by collusion or concealment of facts. At the universities the proctors are officials appointed by the authorities to see that the regulations are adhered to.

PROLETARIAT, the lowest class of the community, taken as a whole. Servius Tullius, sixth king of Rome, took the census of his subjects on a wealth basis, and to the poorest class, whose offspring or *proles* were their chief contribution to the State, he applied the name *proletarii.*

PROME'THEUS, in Greek mythology, one of the Titans. For stealing the sacred fire from heaven he was chained by command of Zeus to a rock in the Caucasus, where an eagle during the day consumed his liver, which grew again each night. He was finally freed by Hercules.

PROPAGANDA. In 1622 a committee of cardinals, known as the *congregatio de propaganda fide*, i.e., "the congregation for propagating the faith," was established at Rome, and still exists as the "Roman Propaganda." Its chief function is to support and extend foreign missions.

PROROGATION OF PARLIAMENT, the act by royal authority of closing one session of parliament with a view to its continuance in another session. As an *adjournment* is from day to day, so a *prorogation* is from session to session.

PROSECUTOR, PUBLIC. See *Public Prosecutor.*

PROSER'PINA, in Greek mythology, the daughter of Zeus and Demeter (Ceres). Abducted by Pluto, ruler of the nether world, she became his bride, but was allowed to spend two-thirds of each year in the upper world (the earth). Her re-appearance each year coincided with the return of Spring, and with her mother she was worshipped at Athens as the goddess of nature's bounty; but in works of art she generally appears as the queen of the lower world.

PROTECTION, the term used in political economy for the system adopted by a Government of imposing tariffs on imported articles, with a view to developing the home production of such articles, or of fostering certain home industries by handicapping foreign competitors.

PROTECTORATE, BRITISH, a country not under British rule, but whose foreign relations are absolutely under the control of the British government. Many of the states of India are in the position of protectorates, though not so designated. There are also the Protectorates of British Central Africa, East Africa, Zanzibar, Somaliland, the Malay States, British North Borneo and Sarawak.

PROTESTANT, one who has adopted the principles of the Reformation and, in consequence, protests against the errors of Roman Catholicism. For the original application of the term see under *Spires.*

PRO'TEUS, in Greek mythology, is a deified mortal, who had the care of the seals of Poseidon (Neptune). He had the gift of prophecy, but being reluctant to exercise his power, he eluded enquirers by changing his shape—animals, plants, fire, and water being his favourite transformations. On being seized he usually revealed the information sought.

PROTOCOL, originally a leaf pasted on scrolls, containing legal or legislative

matter, on which the date, names of witnesses, a brief summary of the contents, etc., were given. Later the name was given to the original copy of any despatch, treaty, or diplomatic document. It is also applied to a document signed by representatives of friendly powers, containing minutes of their discussions and resolutions on some subject of international import.

PROTOZOA. See *Zoology*.

PROVERBS, expressions which contain in a brief form worldly wisdom or moral precept. A proverb has been defined as "the experience of many expressed by the wit of one." Eastern sages were particularly fond of epitomising the results of their observations of human actions, in the form of a proverb. Short, pithy sentences from the works of great writers frequently come into current use as proverbs.

PROVERBS, THE BOOK OF, in the Old Testament of the Bible, is one of the wisest and best-known collections in literature. Their authorship has been much discussed, but it is believed that the majority are utterances of various Hebrew sages, including Solomon.

PRUNES, the dried fruit of the plum tree. Nearly all varieties of plums are converted into prunes, but the finest are produced in the Loire valley of France; the fruit-farms of California, Spain, Portugal, and the Balkan States are our other chief sources of supply.

PRUSSIA, the leading state of the German Empire, of whose area it occupies nearly one-half, extending, with few breaks, along the whole northern coast of the Empire. Its area is 134,622 square miles, and population upwards of 35 millions. Agriculture is flourishing, large crops of cereals, flax, hemp, beet-root, hops, and tobacco being produced. Minerals, especially coal, iron, and zinc are plentiful, and in the manufacture of cotton, woollen, and iron goods, Prussia ranks among the leading countries of the world. Berlin, the capital, is the great railway centre of Germany, and has very extensive manufactures. Other important towns are:—Hamburg, Breslau, Cologne, Frankfurt-on-Main, Dusseldorf, and Kiel. The present kingdom of Prussia has grown out of the Mark of Brandenberg, acquired by the Hohenzollern family in 1415. With the addition of the duchy of Prussia, the state developed under the military regime of Frederick William, the "Great Elector," (1640–1688), whose son assumed the title of Frederick I., king of Prussia, in 1688. Frederick the Great (1740–86) made Prussia prominent among the Great Powers, and added Silesia to his kingdom. More territories were added by the partitions of Poland in 1772, 1793, and 1795. The crushing defeat at the hands of Napoleon at Jena, 1806, brought Prussia to the rank of a second-rate power with considerable reductions of territory, but she recovered her position in 1815. War with Denmark, in 1864, added Schleswig-Holstein to Prussia, and the successful campaigns against Austria in 1866 increased her territory and her prestige. The war with France, 1870–1, led to the formation of the present German Empire, the imperial crown being vested in the king of Prussia and his heirs.

PRYNNE, WILLIAM, *b.* 1600, *d.* 1669, an English lawyer, prominent in the struggle between king and parliament in the reign of Charles I. His "Histriomastix," a virulent attack on theatres, and containing veiled references to the evil influence of the king and queen, led to his punishment in 1633, by the Star Chamber. He was fined £5,000, expelled from his profession, placed in the pillory, deprived of both ears, and imprisoned. Freed by the Long Parliament in 1640, he entered Parliament, and as a Presbyterian sided with the king in 1648. He suffered imprisonment during the Commonwealth, and at the Restoration became keeper of the Records in the Tower.

PSALMS. The name is especially applied to a collection, numbering 150, contained in one of the books of the Old Testament. Many of these are traditionally ascribed to King David, while others were undoubtedly composed after the return of the Jews from exile in Babylon. They form a treasury of prayer and praise suited to all circumstances and to all sorts and conditions of men of every age and country.

PSY'CHE, in Greek mythology, the personification of the human soul. In works of art she is represented as a beautiful maiden with the wings of a butterfly. Her love for Cupid is the theme of one of the most beautiful of classical allegories.

PTARMIGAN, a member of the grouse family; is common in Norway, and is found in the mountains of Scotland. It changes colour with the seasons, being mottled grey, like the lichen-clad rocks, in summer; and white, like the snow, in winter. It thus finds protection from hawks.

PTERODACTYL, an extinct reptile with wings like those of a bat, and a beak like that of a bird. It is only found in the rocks of the secondary period. The name means a wing formed by the fingers.

PTOLEMY I., *d.* 283 B.C. He was probably a natural son of Philip of Macedon, but the date of his birth is unknown. He was one of the bravest and most skilful of the generals who accompanied Alexander the Great in his campaigns, and on Alexander's death, in 323 B.C., he became regent of Egypt. In the wars that followed between the various Macedonian provinces, he successfully held Egypt, and in 306 B.C. assumed the title of king. After a wise and firm rule, he abdicated, in 285 B.C., in favour of his son.

PTOLEMY, L. CLAUDIUS, born early in the 2nd century A.D., probably at Alexandria, was the most famous geographer and astronomer of antiquity. His "geography" and terrestrial maps were regarded as authoritative up to the 15th century, when Columbus and Bartholomew Diaz made their discoveries. His "Syntaxis," in which he set forth his system of the universe, represented the earth as the fixed centre of the universe, with the heavenly bodies revolving round it. This system, known as the *Ptolemaic*, held its ground till Copernicus propounded his system in 1543.

PUBLIC PROSECUTOR. In State matters the Attorney-General is the official to prosecute. In other cases the duty was formerly left to private individuals, but in 1879 a public prosecutor was appointed, and in 1883 the duties of his office were imposed on the Solicitor to the Treasury. Prosecutions, where the public interest is concerned, are now usually undertaken by him or by Local Authorities. In Scotland such prosecutions by private persons are almost unknown.

PUCK, a lively, mischief-loving little fairy, whose existence was taken for granted in superstitious times. The name, which means "a little devil," was introduced into English folk-lore by the Danes. He is the mischievous attendant of Oberon in Shakespeare's "Midsummer-Night's Dream," and is the same as "Robin Goodfellow."

PUGILISM. See *Prize-fighting*.

PULLEY, a mechanical device for raising weights, or transmitting power through ropes passing round them.

PULTOWA, or POLTAVA, a town of S.W. Russia, on the railway from Odessa to Moscow. It contains several woollen-cloth mills, and its annual wool fair attracts many merchants. Near it, in 1709, the long struggle between Peter the Great of Russia and Charles XII. of Sweden culminated in the defeat of the latter, and the gradual acquisition by Russia of the Swedish territories along the east of the Baltic; population 54,000.

PUMICE STONE, a light spongy stone formed out of the froth-like part of lava. Its lightness is due to the fact that gases escaping form cavities and passages just as it is on the point of solidifying. It floats for a long time after ejection from the volcano, but ultimately gets saturated with water and sinks. It occurs abundantly in the Lipari Islands, the Auvergne Mountains, Iceland, and the Canary Islands.

PUMP. The common "suction-pump" for raising water from a depth, consists of a barrel fitted with a spout near its upper end for the discharge of the water, and a pipe, or suction-tube, of smaller diameter, whose lower end dips into the water to be raised. At the junction of the barrel and the suction tube is a valve which opens upwards. The barrel contains a piston which can be raised and lowered vertically in the barrel by means of a rod attached to the handle. This piston is fitted with a valve which opens upwards. When the piston is raised from its lowest position in the barrel, the valve of the suction-tube opens and the water rises in the barrel. The descent of the piston closes the suction-tube valve, and the water collected in the barrel passes through the piston-valve. On raising the piston again, this water is forced through the discharge spout.

PUN, a humorous expression, in which there is a play upon a word which has different meanings. The teacher who was correcting a child for calling Abraham and Isaac "partridges," made a pun in telling the offender not to make "game" of the patriarchs.

PUNCH, the short, hump-backed, hooked-nosed exponent of tragi-comic humour, who takes the leading part in the familiar street-play, "Punch and Judy." The word is an abbreviation of "punchinello," itself a corruption of the Italian "polichinello." The play is said to have originated at Naples in the 16th century, and from that city to have gradually spread over Europe. The drink called "punch" derives its name from the Hindu *punj*, five, the Hindus using five ingredients to make it.

PUNCHESTOWN, a famous racecourse near Naas, 20 miles south-west of Dublin. Here, in April, are held the steeplechases which form the racing event of the year for Dublin folk.

PUNDIT, or PANDIT, a learned Brahman, skilled in Sanscrit, and in the religion, literature, and laws of India.

PUNJAB, a province of north-west India, drained by the Indus and its four main tributaries:—Sutlej, Ravi, Chenab and Jhelum—from which fact it gets its name, *punjab* being the Hindu for "five rivers." It is ruled by a lieutenant-governor, and inhabited chiefly by Sikhs, who were brought under British rule after two wars, 1846 and 1848–9. The climate is dry and not unhealthy. Immense quantities of wheat and barley are produced. The chief towns are Delhi; Lahore, the capital; Multan, an important railway junction; Amritsar, the headquarters of the Sikh religion; and Peshawar, a military station at the head of the Khyber Pass. In 1859 the division of Delhi was transferred to the Punjab

from the North-west Provinces. Area 110,000 square miles; population exceeds 21 millions.

PUNKAH, a large fan used in tropical countries, particularly India, to keep the air in rooms cool. It takes the form of a rectangular frame, over which cloth is stretched. The punkah hangs from the ceiling, and is kept oscillating by a servant or by machinery.

PUPA, one of the forms assumed by most insects which undergo various metamorphoses in passing from the egg stage to that of the perfect insect. In the case of moths and butterflies, the pupa stage succeeds that of the caterpillar, the pupa being known as the chrysalis.

PURBECK, ISLE OF, a peninsula about 9 miles long on the coast of Dorset. Much of the gray marble used in mediæval churches in the south of England was obtained from the limestone quarries here. Purbeck marble is the general name for lime-stone of a similar type quarried in other parts of Dorset. It is used largely for ornamental building purposes.

PURCELL, HENRY, *b.* at Westminster, about 1658, *d.* 1695, one of the best English musical composers. In 1680 he was appointed organist of Westminster Abbey. His setting of some of Dryden's poems, his glees and cantatas, his chants and anthems, are much admired. He is chiefly remembered as a writer of church music.

PURGATORY, the place in which, according to the doctrine of the Roman Catholic Church, the souls of the truly penitent are purged of sins unexpiated during their lifetime. The doctrine was first formulated in express terms by Gregory the Great. Prayers and masses are considered by Roman Catholics to be efficacious in shortening the soul's sojourn in Purgatory.

PURIM, a Jewish festival, celebrated with much mirth on the 14th and 15th of the month Adar (March). It commemorates Esther's frustration of the schemes of Haman, as described in the Book of Esther.

PURITANS, a religious party that arose in England in the latter half of the 16th century, as a result of the spirit of religious enquiry engendered by the Reformation. They aimed at reproducing a form of worship as simple as that observed in Apostolic times, and desired to remove from public worship all forms and ceremonies that seemed to them opposed to the spirit of true religion. Under the name of Brownists, they suffered a mild persecution in Elizabeth's reign, and inability to secure fair treatment led many to emigrate to America in the reign of James I. They formed the chief element in the opposition to Charles I., and gained the ascendancy in England under the Commonwealth. The religious reaction at the Restoration, followed by the passing and enforcement of the Act of Uniformity, made their lot a trying one; but their share in the Revolution of 1688 led to the passing of the Toleration Act in 1689, and the subsequent removal of all the religious and political disabilities under which they suffered.

PUSEY, EDWARD BOUVERIE, *b.* near Oxford, 1800, *d.* 1882, a celebrated English theologian. In 1824 he was elected a Fellow of Oriel College, Oxford, and from 1829 to his death he was Regius Professor of Hebrew at Oxford. He took a prominent part with Newman and Keble in the "Oxford Movement," and contributed two tracts on Fasting and Baptism to the series of tracts, which gave the name of "Tractarians" to those in favour of "High Church" principles. In 1843, in consequence of a sermon on the "Holy Eucharist," Dr. Pusey was suspended for three years from preaching. The only effect of this prohibition was to make Pusey for some years the most influential man in the Church of England. The Oxford or Tractarian Movement now took the name of Puseyism, and its adherents were called Puseyites. Of his larger works, the most important are his two books on the Eucharist, his "Commentary on the Minor Prophets," and his "Lectures on the Prophet Daniel." He also took part in editing a series of translations from the "Fathers of the Holy Catholic Church."

PYGMALION, a king of Cyprus, who carved an image of a maiden in ivory, and became so enamoured of his work that he begged Aphrodite (Venus) to give it life. The goddess granted his request, and the transformed statue became his wife. The story is introduced into William Morris's "Earthly Paradise."

PYGMIES, a race of tiny human beings mentioned by Homer, Herodotus and other classical writers, and regarded as fabulous until Stanley's encounter with the dwarf tribes of the Congo Forest in 1888.

PYM, JOHN, *b.* in Somersetshire, 1584, *d.* 1643, an English statesman, who took a prominent part in the struggle against Charles I. He took part in the impeachment of Buckingham, helped to frame the Petition of Right and the Grand Remonstrance, and was one of the five members whose attempted arrest by Charles led to the outbreak of the Civil War. His great work, the successful arrangement of the "Solemn League and Covenant" between the Scots and Parliament, in 1643, led to such issues as he did not live to see realised.

PYRAMIDS, structures of stone or brickwork, standing on a square base and tapering upwards to an apex. In ancient times, such structures were commonly erected to the memory of a departed king or personage of importance. The Egyptians were especially noted as pyramid builders, and about forty, constructed between 4000 B.C. and 2000 B.C., still exist. In most cases they are built over a chamber containing the sarcophagus of a king. Limestone was the chief material used, but huge blocks of granite formed the outer casing. In all cases, the four triangular sides were so placed as to face the four points of the compass. An intricate passage was left during the raising of each pyramid, leading to the central chamber. The best known group of pyramids is that of Gizeh, a few miles north of Cairo. This group contains eleven pyramids, that of Cheops, 450 feet in height, being the largest and most imposing. It contains over 80 million cubic feet of masonry, and encloses several chambers. All these monuments suffered considerably from spoliation by the Arabs in the 7th century A.D.

PYR'AMUS AND THISBE, two Babylonian lovers, whose story occurs in Ovid's "Metamorphoses," and is humorously employed by Shakespeare in "Midsummer-Night's Dream."

PYRENEES, a lofty range of mountains stretching for about 240 miles between the coasts of the Bay of Biscay and the Mediterranean Sea, and forming a natural frontier to France and Spain. Maladetta (11,165 feet) and Perdu (10,994 feet) are the chief peaks. Of the many passes, five admit of the passage of carriages, whilst railways from France to Spain pass round the eastern and western extremities of the range.

PYRI'TES, (i-tes) the name given to sulphides of iron, copper, and other metals. They are principally mined for the sake of the sulphur that is obtained from them. The name originates from the fact that sulphide of iron yields sparks of fire (Gr. *pur*), on being struck with flint.

PYRRHIC DANCE, a favourite war-dance in the Dorian States of Ancient Greece. It was intended as a gymnastic training for war.

PYRRHUS, *b.* 318, *d.* 272 B.C., king of Epirus, in Greece, and the most famous warrior of his day. He invaded Italy, and with the help of his elephants gained two brilliant victories, but reaped no fruits from his successes. Hence the meaning of a "Pyrrhic victory." In a second invasion of Italy, his troops were totally defeated at Beneventum, 275 B.C. Pyrrhus afterwards conquered Macedonia, but in a war against Sparta he was killed by a woman at Argos, with a tile hurled from a roof.

PYTCHLEY, a Northamptonshire village, 3 miles from Kettering, one of the most famous hunting centres in England. The hunt was established in 1773, and the "Chase Books" at Althorpe give detailed accounts of each day's hunting for some years. In Domesday Book the owner of Pytchley (Pightesley) is recorded as a hunter of wolves, foxes, and other vermin.

PYTHIAN GAMES, one of the four great national festivals of Greece, held every fourth year on a plain near Delphi. The games were held in honour of Apollo, the slayer of the celebrated serpent, *Python*, at Delphi.

PYTHIAS. See *Damon*.

PYTHON, a genus of serpent found in Eastern Asia, Africa, and Australasia. It is not poisonous, but kills its prey by crushing it within its folds. The largest attain a length of about twenty feet.

PYX, TRIAL OF THE, the annual test of the quality and weight of gold and silver coins, issued during the preceding year, which is conducted by a jury of goldsmiths chosen by the Lord-Chancellor. It is usually held at Goldsmiths' Hall, London. The coins tested are specimens taken at random from each day's minting, and kept in a *pyx*, or strong-box, at the Mint, until the day of trial arrives.

QUACKERY. Medical practitioners, whether qualified or unqualified, who make boastful pretence to a surgical or medical skill which they do not possess, are called quacks, and their self-assertion quackery.

QUACKS. See *Med. Dict.*

QUADRAGESIMA (Latin, *fortieth*) includes the season of Lent—forty days. The name is, however, generally applied to the first Sunday in Lent, the three preceding Sundays being Septuagesima, Sexagesima, and Quinquagesima.

QUADRILATERAL, a four-sided figure (Latin *quatuor*, four, and *latus, lateris*, a side). The name is given in history to the four great fortresses of Northern Italy which stretch from the foot of the Alps to the river Po. They are Peschiera, Mantua, Verona and Legnago. They checked Napoleon III. after his victories of Magenta and Solferino in 1860, and caused him to sign the treaty of Villafranca. Russia has her quadrilateral, on her western frontier, and Bulgaria also boasts her quadruple fortifications.

QUADROON, the child of a white person and a mulatto, or half-breed. Thus the quadroon is a person who is in respect to parentage one-fourth black and three-fourths white.

QUADRU'MANA, meaning "four-handed," is the name given to a section of mammals made up of the apes, monkeys, and lemurs. Each of the four hands has a thumb, which can be

opposed to the remaining fingers. In this it differs from a foot, in which the great toe is not thus opposable.

QUADRUPLE ALLIANCE, a league formed in 1718, between England, France, Austria, and Holland, to counteract the schemes of Cardinal Alberoni, the Spanish Minister. It was really the Triple alliance of the preceding year extended by the admission of Austria to the league of the other three Powers.

QUAESTOR, a Roman magistrate. In the early history of the Republic, the Quaestors, two in number, united the office of our coroners with that of public executioners. In later times their duties were those of public treasurers, and they were always patricians. In 421 B.C. two more quaestors were appointed, and the office was thrown open to plebeians. In the last days of the Republic, when its dominions had vastly extended, the number of quaestors increased to forty, since at least one quaestor accompanied each army on foreign service.

QUAGGA, an animal allied to the Zebra, formerly found in great herds in South Africa, but now much reduced in number owing to the slaughter by European sportsmen. It owes its name to its shrill cry.

QUAI D'ORSAY, the quay on the south bank of the Seine, in Paris, on which is situated the building of the Corps Législatif. Hence the name is given to the French Government, much as the English Government is spoken of as the Court of St. James's and the Turkish Government as the Sublime Porte.

QUAIL. This bird is allied to the partridge and the grouse, and like them it ranks high as an article of diet. It is, fortunately, a very prolific bird, or it would have been exterminated long ago. Its migrations cover a wide area. In the East, these birds are pitted against each other after the manner of game cocks.

QUAIN, SIR RICHARD, *b.* at Mallow, in Ireland, 1816. *d.* 1898; an eminent physician and pathologist. His professional writings are numerous and important, and he has always taken a strong interest in public affairs touching his profession. He edited the "Dictionary of Medicine," and was largely responsible for much in the British Pharmacopœia.

QUAKERS, a popular name for the "Society of Friends" founded by George Fox about 1670. The Society now comprises about 20,000 members in the United Kingdom. It has 400 recorded ministers, including 160 women, and 400 places of worship.

QUARANTINE (French *quarantaine*—40 days). When a vessel arrives from a port where typhus, plague, smallpox, or any other infectious disease is prevalent, she is not permitted to land her cargo, nor is any one on board allowed ashore except at appointed places, and under special regulations. She is "in quarantine" and may be thus secluded for 40 days. If she has no sick aboard, she flies a yellow flag, but should she have sick, a yellow flag with a black spot. Quarantine is practically abolished in England.

QUARITCH, BERNARD, *b.* 1819. *d.* 1899; a famous collector of, and dealer in, rare books. He was a German by birth, but was naturalised as a British subject in 1847. He set up at first as a small second-hand bookseller in Leicester Square; after his removal to Piccadilly, his place of business became the resort of all book-lovers.

QUARLES, FRANCIS, *b.* 1592. *d.* 1644; poet and essayist. His numerous writings are all of a moral or religious nature, and among the serious they were highly valued. Of his poetry the "Divine Emblems," and in prose the "Enchiridion," a collection of essays and meditations, hold the first place.

QUARTAN FEVER, L. *quartus*, fourth, so called because the paroxysms recur every fourth day, counting both those on which they occur, thus giving two days' intermission. See "Ague" in *Med. Dict.*

QUARTER-DECK, the part of the upper deck abaft the main-mast. On a man-of-war it is pre-eminently the place of honour. Here the ship's crew assemble when addressed by the captain, and here visitors of distinction are received. On ordinary occasions it is the promenade of the senior officers.

QUARTERMASTER, in the army, an officer of a regiment or battalion who is responsible for the feeding, clothing, and lodging of his force. The post, which carries with it the rank of a lieutenant, is usually given to an experienced sergeant, and is much sought after. In the navy the quartermaster is a first-class petty officer, whose duty is to assist the navigating officer, and generally to keep watch and convey orders for the working of the ship.

QUARTERN, a quarter of something. In liquid measure it signifies a quarter of a pint; in dry measure a quarter of a stone, that is, 3½ lbs. A quartern loaf, however should weigh 4 lbs.

QUARTERSTAFF, a favourite weapon of the English peasant in the Middle Ages. It was a stout, heavy pole about 7 feet long, often bound at the ends with iron. It played an important part in the encounters with Robin Hood's "merry men."

QUARTODECIMANS (Latin *quartus decimus*—fourteenth). In the second century the Eastern and Western Christians fell out as to the exact time of keeping Easter. The Easterns kept it on the 14th of the first Jewish month, assuming that to be the day of the Jewish Passover. The Westerns kept it on the Sunday following the 14th. A council held at Nice in 325 decided in favour of the Westerns, who from that time called the Easterns "quartodecimans."

QUARTZ is the most widely distributed of all minerals. Pure quartz is an oxide of silicon. It crystallises in six sided prisms, in which form it is often called rock crystal. Cairngorms, cat's eye, chalcedony, jasper, cornelian, agate, and flint are all forms of quartz. Gold is mostly found in quartz reefs.

QUATERNARY DEPOSITS, also known as Post Tertiary, are the fourth and last divisions of the stratified rocks forming the earth's crust. The strata comprise the Glacial, Post Glacial, and Recent systems. Thus the lands recently formed by the sea, or deposited as alluvium by rivers, are late Quaternary.

QUATRE BRAS, a village a few miles south of Waterloo. A fierce battle was fought here on June 15th, 1815, the French cavalry, under Marshal Ney, making attack after attack on the British infantry squares, but being each time repulsed with heavy loss. The British fell back on Waterloo, to renew the fight on June 18th.

QUEBEC (State). This is the oldest State of the Dominion of Canada. It lies along the lower course of the river St. Lawrence. Its surface is covered with immense forests, wide stretches of agricultural land, and innumerable large lakes. Its climate is one of the most healthy and bracing in the world, and the dry cold of winter is pleasant and invigorating. The soil is most productive: cereals, grass, and root crops are raised in abundance. Tobacco, flax, hemp, and maize are grown, and grapes ripen in the open air. Apples, pears and apricots are grown in immense quantities for exportation. Cattle rearing is an important industry; frozen beef is being largely exported to England; Canadian Cheddar (cheese) is sent over to us in vast quantities. The French language and French laws are recognised by the legislature. A rebellion in 1837-8 led to the union of Upper and Lower Canada, and after-troubles resulted in the confederation of Canada with the other provinces of British North America (except Newfoundland) in 1867. This group of States is known as the Dominion of Canada.

QUEBEC (City) was founded in 1608 by the French geographer, Samuel Champlain, who settled there with twenty-eight followers. The commanding position of Quebec is exceedingly fine. The city is divided into the Upper and Lower Town, connected by a steep, winding street. The Upper town includes the walled city, with two suburbs, St. John and St. Louis, between the walls and the Plains of Abraham. A monument marks the spot where General Wolfe fell at the capture of the city in 1759. The Upper town is a conglomeration of quaint mediæval streets, while the Lower town, on the banks of the St. Lawrence, is devoted to commerce.

QUEEN ANNE'S BOUNTY. Refer to *Index*.

QUEEN OF SHEBA. The celebrated visit of this queen to King Solomon is recorded in 1 Kings x. She had heard of his wisdom, and came "to prove him with hard questions." When he had solved all her difficulties she made him many valuable presents, and congratulated his subjects on their good fortune in having so wise a monarch. The Sabæans were the inhabitants of the South-West of Arabia, now called Yemen, and the Queen of Sheba was probably their sovereign.

QUEENSFERRY, a town of Linlithgow, 9 miles from Edinburgh, on the south bank of the Forth. It is here that the famous Forth Bridge crosses the river. Near the town are the seats of the Earls of Rosebery and Hopetown, Dalmeny Park and Hopetown House. Rosyth, near Queensferry, has been chosen as a new naval station of the British Navy in the Forth. The site is 7 miles west of the Forth Bridge.

QUEENSLAND is the second largest of our Australian colonies, but the last to be colonised. It measures 1200 miles from North to South, and 800 from East to West, and lies mostly within the tropics. Little was known of this portion of Australia till it was partially explored by Surveyor-General Oxley in 1823. He discovered and named the river Brisbane. The Dividing Range, a continuation of the mountains of New South Wales, divides Queensland into three belts, viz., the coast regions between the mountains and the Pacific, the mountains and tableland themselves, and the well-watered slopes to the west of the plateau. No Australian colony has such extensive grass lands as Queensland. Near the towns, the country is divided into farms; farther inland it is occupied by squatters, with vast herds of cattle and horses, or flocks of sheep. Refer to "Queensland" in *Index*.

QUEENSTOWN, a port on an island in Cork Harbour, and so named in honour of Queen Victoria, who landed there in 1849. It is a place of call for vessels plying between Europe and America. The Anglo-American mails are received and despatched from Queenstown, being carried to and from London via Holyhead and Dublin.

QUERN, the hand mill formerly used by the peasantry for grinding corn. It consisted of two flat circular stones, of which the upper was pierced with a central conical hole, through which the corn was poured. The upper stone was rotated on

the lower by turning a wooden handle fixed in the stone, near its edge.

QUETTA, a town in Beluchistan, of great strategic importance, which has virtually been British since 1857. It guards the exit from India through the Bolan Pass (51 miles long), and dominates the Pishin Valley and the road to Kandahar. It is the terminus of a military railway from Sikkur on the Indus.

QUIBERON, a long narrow peninsula on the North-west coast of France. The fishing village of Quiberon stands at its extremity. In 1795 an English fleet landed there a party of French Royalists who sought to rouse the Bretons and Vendeans against the government. They were defeated by the Republican General Hoche, and the prisoners were nearly all shot by the order of the Convention. In Quiberon Bay, in 1759, an English fleet under Hawke defeated a French fleet under Conflans.

QUICKSANDS (*quick*=lively) are so called from their movements, as they are seemingly quick or living. They usually occur on flat shores, where the upper sand rests on a bed of rock impermeable to water. If, therefore, the tide comes in fast, and the lower stratum does not absorb water, the upper sand becomes saturated and moves with each influx of the waves. The Goodwin sands are quicksands at the rise of the tide.

QUICKSILVER, or **MERCURY,** is a metal which is fluid at ordinary temperatures. It is mostly obtained from its sulphide, which is called cinnabar, and is a crude vermilion. The chief mines for quicksilver are at Almaden, in Spain, and Idria, in Austria. The metal is largely used in the construction of barometers and thermometers, and in the extraction of gold from the quartz in which it is found.

QUIETISM is a kind of mysticism common to many forms of religion. The quietist attempts to enjoy actual communion with the Highest, by a kind of rapture in which all earthly surroundings are forgotten. The great objection urged against quietism is, that it leads to the ignoring of all responsibilities.

QUINCEY, DE. See *De Quincey.*

QUININE. See *Med. Dict.*

QUIN, JAMES, *b.* 1693, *d.* 1766; a famous actor, who from 1716 was the chief English actor till Garrick appeared (1741). The two acted together in the *Fair Penitent,* 1746, each contending for the first place in popular favour. In 1751 Quin left the stage, feeling bitter at his rival's acknowledged pre-eminence.

QUINTAIN, a piece of apparatus much used in the Middle Ages to train young gentlemen in the use of the lance and the management of the horse. It consisted of a figure with two long horizontal arms balanced on a pivot. The young aspirant had to ride and strike a flat board at the end of one arm with his lance, then pass on and get clear of a bag of sand at the end of the other, which swung round when his blow was delivered.

QUIR'INAL, one of the seven hills on which ancient Rome was built. The Capitoline hill was accounted the first, the Palatine the second, and the Quirinal the third of these famous hills.

QUIRI'TES (i-tes). This was the name of the citizens of Rome in their civil capacity; the name by which political orators always addressed them. The word was probably derived from Quirinus (Mars), who was supposed to have Rome under his especial care.

QUITO, the capital of Ecuador, though situated nearly on the Equator, enjoys a temperate climate, being built at a height of 9,000 feet above the sea level. The city is intersected by ravines. Water carriers bring water into the city in jars, as there is no regular supply. The streets are lighted at night by kerosene lamps. The population of 5,000 consists mostly of Indians and half breeds.

QUIT RENT, a corruption of the old Anglo-Saxon, *hwit-rent,* or white rent, so called because paid in silver. It was an annual charge paid by a tenant to the lord of the manor in lieu of certain services which otherwise he had to render, such as ploughing his lord's fields, etc.

QUORN or **QUORNDON,** a Leicestershire village about 2½ miles from Loughborough. It gives its name to a celebrated kennel of foxhounds. The hunt is called "The Quorn."

QUORUM. See *Commercial Dictionary.*

RABBIT. The harm the rabbit does in a populous country like England, where he is easily kept under, is probably counterbalanced by the good derived from the change of food he affords us. But in Australia and New Zealand, where his natural enemies are few, the rabbit has proved a serious pest to the farmer, and determined war is waged against him. From a single pair it is calculated that about a million descendants might be looked for under the most favourable conditions at the end of four years, so we see the serious nature of the problem to be faced in those countries. On the other hand, that breeding of the rabbit as an article of commerce can be made profitable under certain conditions is shown by the Belgians, who send every week in the winter close on 200 tons of rabbits to the English markets.

RABELAIS, FRANCOIS, *b.* 1483, *d.* 1533, was a native of Touraine, and became famous as a writer. His great work is the History of Gargantua and Pantagruel, a satirical romance, which, though soiled by the coarseness and obscenity of the times, abounds in original ideas, learning, and good sense, mixed with wild and extravagant nonsense. Under the mask of fiction, Rabelais spoke his mind concerning kings, priests, and scholars.

RABIES. See *Med. Dict.*

RACE OF ALDERNEY, a passage about 10 miles wide, between Alderney and the French coast. It is so called from the fierce sweep of the tides through the channel.

RACES OF MANKIND. Mankind is generally classed in five races. The most advanced is the Caucasian or White race, and the next the Mongolian or Yellow race. The Negro or Black race is peculiar to Africa and the Red Indians to America. The Malay or Brown race is limited to south-east Asia. The inhabitants of New Guinea and Australasia are of the Papuan race, thought to be a mixture of the Malay and Negro races.

RACHEL, ELIZA, was a great tragic actress. She was born at Aargau, in Switzerland, 1821, and began her career by singing in the streets of Paris. The excellence of her voice being recognised, she received lessons in singing, elocution, and acting from the best masters, and in 1838 she took Paris by storm when she appeared at the Théatre Français as Camille in *Les Horaces.* She excelled in the portrayal of evil or malignant passion. Her popularity brought her immense wealth, which she lavished on her family. She died in 1858.

RACINE, JEAN BAPTISTE, *b.* 1639, *d.* 1699; was the favourite tragic poet of the court of Louis XIV. In delineating the passion of love, he excels in tenderness, softness, and elegance all other French dramatists. His best tragedies are Phédre and Athelie. The latter was composed for a private performance by the ladies of St. Cyr.

RACK, an instrument of torture consisting of an oblong frame work, having a roller at each end. The victim was stretched upon the frame; his hands and feet were tied to the rollers with cords, and the rollers were turned by levers, so as to tighten the cords, and dislocate his joints. The rack was a common instrument of torture in England during Tudor and early Stuart times.

RADCLIFFE, JOHN, *b.* at Wakefield, 1650, d. 1714. He studied medicine at Oxford, and became the leading London physician. He attended Queen Mary and several members of the Royal family. In 1714, when Queen Anne was taken ill Radcliffe was summoned, but, pleading illness, did not attend. This roused the populace against him, and he was forced to leave London. He died of gout in 1714, leaving £40,000 for the erection of the Radcliffe Library at Oxford. In 1861 the books were taken to the University Museum, and the building of the Radcliffe Library is now the Reading Room of the Bodleian Library. Out of the residue of his estate the Radcliffe Observatory was established in 1772.

RADIAN. The angle suspended at the centre of a circle by an arc equal in length to the radius is called a "radian." It is also the unit of circular measure. It is approximately equal to $180° \div 3\frac{1}{4}$ or, more accurately, the radian is an angle of 57° 17′ 41″.

RADIA'TA, the name given by Cuvier to one of his four divisions of the animal kingdom. The Radiata included star-fishes, worms, jelly-fishes, sea anemones, and rotifers,—creatures now classified in widely different groups.

RADIATION. See *Heat.*

RADICAL, the name given to the more advanced wing of the Liberal party in England. It came into use about 1816, to denote those who, like Hunt, Cobbett, and Cartwright, were demanding *radical* reforms in the constitution.

RADIUM, a metal discovered by Madame Sklodowska Curie and her husband, while investigating in Paris the Becquerel rays of uranium, and for which the Davy medal for the most important discovery in chemistry made during the year was awarded to them by the Royal Society of England in December, 1903. The chloride or bromide of the metal is obtained in very minute quantities, as a whitish or greyish powder, from *pitch-blende,* an ore of uranium found in the Erzgebirge Mountains in Germany, and at Redruth in Cornwall. As a result of two years' labour by M. and Madame Curie, eight tons of the mineral produced about a gram of radium chloride, and it has been calculated that in the whole world scarcely more than one-fifth of an ounce is available. On December 31st the price quoted was twelve shillings per milligramme, and tubes containing $\frac{1}{2}$ of a grain have been recently sold at £10 each. Traces of the substances have also been detected in the deposits from the waters of the mineral springs of Bath and Buxton, and, lecturing in May, 1904, Professor Rutherford, who has been one of the principal investigators in England of the properties of the new element, expressed the opinion that radium is an ubiquitous constituent of the earth's crust, which tends to become more abundant as we descend deeper.

Radium is found to be a perpetual source of light and heat. The chloride and bromide emit a light that resembles that of the glow-worm. A diamond placed close to a small quantity enclosed in a pill box in a dark room scintillates as if a lighted candle were brought near it. It gives out sufficient heat to melt its own

weight of ice in an hour, or to raise the temperature of the same weight of water from that of a warm room to boiling-point, and yet there is no apparent diminution of its store of energy.

Radium constantly gives off a something which acts precisely as a heavy gas. This has been collected by Sir W. Ramsay, and enclosed in sealed tubes. Examined by means of the spectroscope, this at first gave the characteristic lines of the metal, but after a couple of days the spectrum of the same gas began to show the lines corresponding to helium, and in about a week, according to the same authority, the characteristic yellow lines of helium were "positively blazing." The intensely active element, radium, the atom of which is 250 times as dense as the atom of hydrogen, seems to have changed into the inert element helium, the atomic weight of which is 2.

Besides this gaseous emanation three kinds of invisible rays, which are known as the alpha, beta, and gamma rays, are constantly given off by radium. The gamma rays seem to correspond with the Röntgen rays. The other two classes are extremely minute particles of electrified matter. A screen, coated with zinc sulphide, as devised by Sir W. Ramsay, when brought near a small quantity of radium, shows by its brilliant flashes and scintillations that it is receiving a perfect bombardment of these corpuscles. The alpha rays, though travelling at an enormous speed, are stopped by a thin plate of metal, but the beta rays, the corpuscles of which are a thousand times smaller, pass through most metals.

If a tube containing a small quantity of a radium salt is held in the hand for a short time, a burning sensation is produced; and a similar tube placed in a cardboard box, and fastened to the sleeve of M. Curie for an hour and a half, resulted in an intense inflammation, which was followed by a sore, which took over three months to heal. Attempts have been made to utilise radium in the treatment of cases of superficial cancer, but with apparently little success at present.

RAE, HENRIETTA (Mrs. Normand), *b.* 1859, a distinguished lady artist. First exhibited in the Royal Academy, 1880. She has painted "Ophelia," "Psyche at the Throne of Venus," "Vashti Dethroned," and "Sir Richard Whittington," a fresco in the Royal Exchange. Of her many portraits the most striking is "The Marquis of Dufferin."

RAE, JOHN, *b.* in the Orkneys, 1813, *d.* 1893, was a celebrated Arctic traveller. In 1848 he joined in the unsuccessful search for Sir J. Franklin. Six years later he explored King William's Land, and proved it to be an island. Later he surveyed lines for a telegraph between England and America, via Iceland and Greenland, and for another across the Rockies westward from Winnipeg.

RAEBURN, SIR HENRY, *b.* near Edinburgh, 1756, *d.* 1823. He was apprenticed to a goldsmith, but turned miniature painter. He studied in Italy, returned to Edinburgh, and became celebrated as a portrait painter. Nearly all the great Scotsmen of his time sat to him.

RAFFLES, SIR STAMFORD, *b.* 1781, *d.* 1826, began his career as clerk in the India House. In 1805 he was sent as Assistant-Secretary to Penang, and later became Chief Secretary. He became Lieutenant-Governor of Java in 1811, when it was taken by the English. His efforts to civilise the natives, and to give them a just government, won their affection and respect. To him we owe the settlement of Singapore, which he chose as a centre from which to suppress piracy, and compete in trade with the Dutch. When returning to Europe he lost his valuable collection of natural history specimens, and all his manuscripts, in a fire at sea. He lived to found the Zoological Society, and to become its first President.

RAGLAN, LORD, *b.* 1788, fourth son of the Duke of Beaufort. As Lord Fitzroy Somerset he served with distinction under Wellington in the Peninsula. At Waterloo he lost his right arm. When Wellington was made Commander-in-Chief, Lord Fitzroy Somerset became his secretary. He took the command of the English army in the Crimean War (1854–6), and died during its progress in 1855.

RAIKES, ROBERT, *b.* at Gloucester, 1735, *d.* 1811. Shocked at the ignorance of the children of Gloucester, his native town, he in 1780 opened a Sunday School for teaching them reading and the repetition of the Church Catechism. Other cities followed the example, and Sunday Schools became general.

RAILWAYS. The advantage of a firm and even road for carriages led to the laying of stone and wood tracks, and later, of iron rails, the wheels of the carriages being flanged to keep them on the track. At first the carriages were drawn by horses, and these roads led mostly to collieries and quarries. Hedley's "Puffing Billy," the first successful steam locomotive, was patented in 1813. It was worked at Wylam Colliery, Northumberland, till 1872, when it was purchased by the Government. George Stephenson was the first to overcome the difficulty of keeping a sufficient head of steam on the locomotive. He ran an eight-ton engine at 15 miles an hour on the Stockton and Darlington mineral line in 1825. The first passenger railway was the Liverpool and Manchester, opened in 1829.

RAINBOW, the coloured arch seen in the sky by a spectator standing between the sun and a falling shower. The sun's rays passing into the rain drops are partly by refraction, and partly by reflection, divided into and presented to the spectator as the different coloured rays shown in the solar spectrum, viz., red, orange, yellow, green, blue, and violet.

RAINFALL. Refer to *Index*.

RAISINS are dried grapes, and are used as food, or for making wine. They are mostly grown in Spain and in Asia Minor. Currants are a small variety, mostly grown in the Morea and the Ionian Islands. Raisins are dried by exposure to the sun upon hurdles, or they are permitted to dry on the vines, the stems of the bunches being partially severed.

RAKE'S PROGRESS, THE. A set of satirical pictures painted by Hogarth in 1735. Their subject is the descent of a rich young man, through debauchery, to poverty, despair, and madness.

RALEIGH, SIR WALTER, courtier, soldier, and historian, was born near Budleigh, in Devonshire, 1552. As a youth he served in France and Ireland. In the suite of the Earl of Leicester he went to the Netherlands, and on his return was much favoured by Queen Elizabeth. He attempted without success to colonise in North America the district which he named Virginia. On the accession of James I. (1603), Raleigh was accused of complicity in a plot for placing Arabella Stuart on the throne. He was condemned to death, reprieved on the scaffold, and sent to the Tower, where he spent a portion of fourteen years in writing a "History of the World." On being released, in 1616, he led an unsuccessful expedition to Guiana in search of a gold mine. When he returned in 1618 he was executed on his former sentence.

RAMADAN, the ninth month of the Mohammedan year. In that month the Prophet is said to have received his first revelation. It is kept as a strict fast.

RAMBLER, THE. This was the last of a series of publications containing the news of the day, and an essay on some interesting subject. Addison and Steele had issued the *Tatler*, the *Spectator*, and the *Guardian*. Johnson followed with the *Idler* and the *Rambler*, the latter appearing twice a week.

RAMESSE'UM. This statue, which is often called the Memnonium, is the eastern of two enormous, seated statues sixty feet high, standing on the banks of the Nile at Thebes. The statues probably represent Amenoph III., for they are placed opposite to his temple, of which little now remains. The Ramesseum was long supposed to give out a musical note when struck by the first rays of the rising sun.

RAMILLIES, a village in Belgium, near Namur. It was the scene of a crushing defeat of the French by Marlborough in 1706.

RAMMOHUN ROY was a Brahmin of high birth, born in Bengal in 1772. His wide readings in Oriental literature led him to doubt the truth of Brahminism. His frank criticism of his ancestral faith, in which he denounced Hindu idolatry, estranged him from his family and led him to form, in 1828, the Brahmo-Somaj (or Theistic church), a Brahminical society which refuses to recognise caste, and sets its face against idolatry. He died at Bristol, 1833.

RAMSAY, ALLAN, a Scottish poet, *b.* 1686, *d.* 1758. He was apprenticed to a wigmaker in Edinburgh, but at the age of thirty he left wigmaking and set up a bookseller's shop in the Edinburgh High Street. To this he soon added a circulating library, the first opened in Scotland. He had long been known for his humorous poems, which had been sold in the streets at a penny each. His bookseller's business prospered, his shop becoming the fashionable resort of the wits of the time. His principal poem is "The Gentle Shepherd," a Pastoral Comedy published in 1725.

RAMSAY, SIR WILLIAM, *b.* at Glasgow, 1852, was educated at Glasgow University, and at Tübingen in Germany, where he studied chemistry chiefly. His successes as professor of chemistry at Glasgow and Bristol led him to the chair of chemistry at University College, London. His original work has been extensive. Our knowledge of Neon, Crypton, and Xenon is due to him, and he shared with Lord Rayleigh the discovery of Argon.

RANCH. This name is given to the great grazing farms which extend for hundreds of miles east of the Rocky Mountains in the United States and Canada. Formerly ranches were of enormous extent, and the cattle, at the annual "round up," were driven hundreds of miles to the nearest railway for sale. Now the increase of population, and extension of railways have altered all this. There is still a "round up" once or twice annually, but the ranches are smaller and the markets much nearer. The quality of the cattle has been much improved by crossing with superior breeds.

RANGOON is the chief port of Burmah. It stands on the Rangoon river, a branch of the Irawadi, about 20 miles from the sea. The city, which has a population of nearly 200,000, has handsome regular streets, lighted by electricity, and traversed by tramways. Its position makes it the centre of an enormous trade, to accom-

modate which it has extensive docks. It has been in the possession of Britain since 1852.

RANJITSINHJI, PRINCE KUMAR, *b.* in India, 1872; a famous cricketer. On leaving Trinity College, Cambridge, 1895, he joined the Sussex County Cricket Club, and held the premier position as batsman in that club for eight years. He has twice headed the batting averages for All England, and gained great distinction as a member of Stoddart's famous team in Australia, 1897-8.

RANKE, LEOPOLD VON, *b.* 1795, *d.* 1886. This great German historian is best known from his "History of the Popes," so eloquently reviewed by Macaulay. He was educated in the University of Leipsic, and for seven years taught history in the Gymnasium of Frankfort on the Oder. There his published historical works brought him a call to Berlin, where he became Professor of History in the University. Histories of Germany, of Northern Italy, and of the Nations of Northern Europe, testify to his laborious research. His History of England during the 17th century was written when he was over seventy years of age.

RANZ DES VACHES. These are simple melodies played by Swiss and Tyrolese peasants on their great Alpen horns, to call the cattle down from the mountain pastures. They were prohibited in armies in which Swiss mercenaries were formerly enrolled, as they caused in these soldiers an unconquerable home sickness or *nostalgia*.

RAPE OF GANYMEDE. Ganymede was said by the Greeks to have been the most beautiful of mortals. He attracted the attention of Jupiter, who sent an eagle to carry him off, and he was made cupbearer to Jupiter in place of the nymph Hebe.

RAPE OF LUCRECE. Lucrece was the wife of a Roman noble, Collatinus, and was famous for her virtue. Being shamefully outraged by Sextus Tarquin, the son of the last Roman king, she summoned her husband and her friends, and after obtaining their promise to drive the Tarquins out of Rome, she stabbed herself. One of Shakespeare's earliest poems, "The Rape of Lucrece" depicts this episode.

RAPE OF THE LOCK, a mock heroic poem by Alexander Pope. Lord Petre, a man of fashion at the Court of Queen Anne, cut off a lock of the hair of Arabella Fennor, his fiancée, a beautiful maid of honour. Her family were very angry at this outrage, and Pope wrote this delightful little poem to heal the breach, but without success.

RAPE OF THE SABINES. When Rome was but a small fortress on the Capitoline hill, its inhabitants were almost all men. To obtain wives they invited a neighbouring tribe, the Sabines, to join them in open-air sports. While these were in progress, each Roman youth seized a Sabine maiden, and carried her forcibly into Rome as his wife. The Sabine men were about to avenge the insult, when the newly-made brides interfered and made peace.

RAPHAEL, THE ANGEL. According to Jewish tradition he was one of the four angels who stood round the throne of God (Michael, Uriel, Gabriel, and Raphael). In the book of Tobit he is the sociable angel who in human disguise accompanies Tobias in his journeys to Media and back. Milton makes him the messenger of God to Adam, warning him against Satan. Longfellow describes him as the spirit of the sun, bringing to man the gift of faith.

RAPHAEL SANTI, *b.* 1483, *d.* 1520, was a celebrated Italian painter. He learned painting from Perugini, whose style he imitated. He was greatly praised by the rival masters, Michelangelo and Leonardo da Vinci. His subjects were mostly scriptural. In 1514 he was appointed architect of St. Peter's, Rome. His celebrated cartoons are now in the South Kensington Museum. The "Ansidei Madonna" in the National Gallery is an excellent example of his work.

RAPIER, a light, highly-tempered and fine-pointed kind of sword, about 3 feet long. Having no edge, it was useful only for thrusting, and is the weapon always referred to in accounts of duels with the sword. It is still worn as a part of Court dress.

RATIONALISM has been described as a system of belief founded on reason. The rationalist applies to sacred things the same methods of research as he applies to science and history. Lecky says "Rationalism leads men on all occasions to subordinate dogmatic theology to the dictates of reason and conscience . . . It predisposes men to attribute phenomena to natural rather than miraculous causes."

RATISBON (Regensburg) is a town on the Danube, in Bavaria. Its narrow crooked streets and high gabled houses give it a mediæval appearance. It was an important rendezvous for the Crusaders who followed the Danube route to the East. The imperial diet met in its town hall from 1645 to 1806.

RATTLESNAKE, a species of snake found only in America, and so called from the noise it is able to make by means of loose skin at the end of its tail, which it shakes violently when under the influence of fear or anger. It seldom attacks man, but its bite is often fatal.

RAVAILLAC, FRANCOIS, *b.* 1578, *d.* 1610, a French schoolmaster who fanatically stabbed Henry IV. of France. He was torn asunder by horses.

RAVENSPUR, formerly a great seaport on the north of the Humber. When Henry Bolingbroke landed there in 1399, the sea had already eaten far into the land around it, and, before long, Ravenspur itself disappeared. Hull took its place.

RAWAL PINDI, an important military station in the Punjab, 160 miles north-west of Lahore. The town has greatly increased since the last Afghan war, and since the extension of the railways to Peshawar. A great Durbar was held here in 1885, when the Ameer of Afghanistan was met by Lord Dufferin, Governor-General of India.

RAWLINSON, SIR HENRY, diplomatist and oriental scholar. Born 1810, *d.* 1895; he entered the East India Company's army, 1827. In 1833 he went to Persia to reorganise the army of the Shah. While there he diligently studied the cuneiform inscriptions and made a translation of Darius's famous Behustan inscription. He afterwards held the command at Kandahar, represented England at the Persian Court, and became vice-president of the Council of India. He has been called "the father of Assyriology."

RAY, JOHN, naturalist, *b.* 1628, *d.* 1705. After the restoration he travelled over Britain with a friend, Willoughby, collecting and examining botanical and zoological specimens. In 1663 they made a tour through the Low countries, Germany, France, and Italy, Willoughby studying the zoology and Ray the botany of the countries traversed. Ray takes a high rank both as a botanist and as a zoologist. He proposed a system of botany which led to the present natural system of classification. He has been styled "the father of English natural history."

RAYLEIGH (John William Strutt), **LORD,** *b.* 1842, a distinguished scientist, was Senior Wrangler and Smith's Prizeman of Cambridge University. He has made many investigations in Physics and Chemistry, and shared with Professor Ramsay the discovery of Argon in 1894. His scientific writings are important.

READE, CHARLES, *b.* 1814, *d.* 1884; son of an Oxford squire, was a novelist and playwright. His most successful play was "Masks and Faces." Among his novels the best are, "It is Never Too Late to Mend," "Hard Cash," "Griffith Gaunt," and "The Cloister and the Hearth." He stands high among the novelists of the 19th century.

READING, capital of Berkshire, stands at the junction of the Kennet with the Thames. Henry I. was buried there in the Benedictine Abbey, which he had founded. Nine parliaments were held within its walls. Reading Castle was destroyed by Henry V. The last abbot of Reading was hanged by Henry VIII. The town has an important corn trade. Huntley and Palmer's biscuit works, and Sutton's seed warehouses are features of Reading. (For population, etc., see p. 902.)

RÉAUMUR, RENÉ, physicist, was born at La Rochelle in 1683, and was educated in the Jesuits' College at Poictiers. He became a member of the Paris Academy of Sciences and did much literary work for the government. For his discoveries regarding iron and steel he was awarded a government grant of 12,000 livres, which he paid over to the Academy of Sciences for original research. Réaumur is best known from the thermometer which bears his name. He was killed by a fall from his horse in 1757.

REBECCA RIOTS were popular outbreaks against tollgates. They broke out in Wales in 1843. Bands of men, disguised as women, attacked and destroyed the tollbars at night. The military had to be called out and the riots were not suppressed without bloodshed. An enquiry showed that the grievance complained of was real, steps were taken to redress it, and the rioters who had been captured received but light sentences. They took their name from Genesis xxiv. 60.

REBELLION, THE GREAT, was the revolt of the Long Parliament against the tyranny of Charles I. The King claimed the right to levy taxes without the consent of parliament, and to imprison without trial such subjects as offended him. The Parliament, by withholding supplies, forced him to sign the Petition of Right, in which he formally renounced his claims. Still he continued to raise money by illegal exactions, till the Parliament (which sat from 1640 to 1653, and was hence called the Long Parliament) took up arms. The Royal Party were known as Cavaliers, the Parliamentarians as Roundheads. The war between them lasted from 1642 to 1645, when, at Naseby, the power of Charles was completely broken. The king, falling into the hands of the Parliament, was tried, condemned and executed in 1649.

REBUS, a kind of puzzle in which the words are expressed by drawings of things (*rebus*, in Latin, meaning "by things)." Thus an eye, a water-can, a knot, a bear, and a window-pane would stand for "I cannot bear pain."

RECAMIER, MADAME, *b.* 1777, *d.* 1849, a celebrated leader of French society during the First Empire. Her salon was crowded with all the wits and celebrities of the day.

RECIPROCITY, in Political Economy, is the arrangement between two countries that each will admit the goods of the other

on easy terms, though a high tariff excludes the goods of other nations. When Britain adopted the policy of Free Trade, she expected reciprocity on the part of other countries. As many of these taxed British goods, so as practically to exclude them, a demand arose, in 1904, for a tax against these protectionist countries.

RECHABITES. These seem to have been the same as the Kenites who came into Canaan with the Israelites, but had no territory assigned to them, and remained nomads. They abstained from wine, built no house, sowed no seed, nor owned land. We hear of them as associated with the Israelitish priests, and as taking part in religious celebrations. Dr. Wolff found an Arab tribe near Mecca, who professed to be descendants of the Rechabites, and were strict abstainers.

RECORDER. Refer to *Index*.

RECORDS, RECORD OFFICE. See *Archives*.

REDAN. This is one of the simplest forms of fortification, having but two faces, meeting at an angle a little less than a right angle. The Redan and the Malakoff were two celebrated earthworks, forming part of the defences of Sevastopol during the Crimean War. The capture of the Malakoff by the French, September 8th, 1855, led to the fall of Sevastopol, although the British failed in their attack on the Redan.

RED CROSS SOCIETY. An association formed in most civilised countries for co-operating with the governments in tending the sick and wounded during war. The society was the outcome of a convention which met at Geneva in 1863. The nurses and officials wear as a badge a red cross on a white ground. A flag bearing the same emblem flies over the field hospitals and is shown on the ambulance wagons. This secures immunity for all those engaged in the work of the Red Cross Society.

RED CROSS, THE ROYAL. Refer to *Index*.

REDMOND, JOHN EDWARD, *b.* 1851. succeeded Mr. Parnell on his death. 1891. as leader of the Parnellite party in Parliament. and on the reunion of the Irish Nationalists in 1900. he was appointed Parliamentary leader of the whole party.

RED RIVER EXPEDITION. In 1869 the territory of the Hudson Bay Company was transferred to the government of Canada. A number of French and half-breed settlers objected to the transfer, and proclaimed a republic under a French Canadian, Louis Riel. The English government sent a military force of 1,200 men under Lieutenant Wolseley (afterwards Lord Wolseley) to put down the rebellion. Their journey from Thunder Bay, on Lake Superior, to Winnipeg, a distance of 600 miles through pathless forests, down rivers abounding in rapids, was accomplished between the end of May and August 24th, 1870. When Fort Garry (as Winnipeg was then called) was reached, the rebellion collapsed.

RED SEA. This sea fills a deep rift in the earth's crust 1,200 miles long and 130 to 250 miles wide. Its northern end divides into two parts the Gulf of Suez and Akaba. The sea is noted for its high temperature, which partly arises from the fact that both shores are desert. The evaporation is so great that the sea is exceedingly salt. The whole area is rising so that the Red Sea is gradually becoming shallower. It is now connected with the Mediterranean Sea by the Suez Canal. Its southern entrance is commanded by the strong fortress of Aden, a British possession.

REED, the vibrating part of various wind instruments. In the clarionet and similar instruments it is made of the tough outer covering of a reed found in Southern Europe. In the organ pipe. harmonium, and concertina, the reed is of metal, although arranged differently in the two latter.

REEVES, SIMS, *b.* at Shooter's Hill, Kent. 1818. *d.* 1900; England's great tenor singer. He first appeared as a baritone in 1839, but after a course of training at Paris and elsewhere. he re-appeared as a tenor in 1847. taking the first place then. and retaining it for more than forty years. singing latterly only in ballad and oratorio music.

REFERENDUM. In Switzerland, on the demand of 50,000 voters or of eight cantons, any law passed by the Federal Parliament must be submitted to the general body of the people for acceptance or rejection. Similarly the laws passed by the parliaments of the separate cantons may be, and in many cantons must be, referred to the cantonal voters. This referendum is frequently called into requisition. Whilst a referendum is a regular process of Swiss government, a *plébiscite* is an unexpected or occasional reference to the whole body of electors. It was employed on various occasions by Napoleon III.

REFLECTION OF LIGHT. When a ray of light falls on any surface, a portion of it is thrown back or reflected. It is by these reflected rays that objects are made visible to us. When a ray falls upon a plane surface, the reflected ray makes with the surface the same angle as the incident ray.

REFLEX ACTION. See *Med. Dict.*

REFORMATION, THE, is the name given to that religious revolution which stirred all England and a great part of Europe in the 16th century. The results of the movement in this country were (1) the withdrawal of the Church of England from the rule of the Pope, (2) the dissolution of the monasteries, (3) the translation of the Bible into English and the placing of a printed copy in the parish churches, and (4) the compilation of the "Book of Common Prayer" for use in public worship. The first three steps were taken in the reign of Henry VIII. and the fourth in the reign of Edward VI.

REFORM BILLS, PARLIAMENTARY. (1) The first Reform Bill, 1832, disfranchised all boroughs with less than 2,000 inhabitants, and took away one member each from 30 boroughs more, whose population was between 2,000 and 4,000. This gave 143 seats for distribution among the more populous places. It bestowed the franchise upon tenants paying in boroughs a rental of £10 a year, and, in counties, a rental of £50. (2) The second Reform Bill, 1867, gave the franchise in boroughs to all householders paying poor rates, and all lodgers paying £10 a year, and in counties to all tenants whose rental was at least £12 a year. (3) The third Reform Bill, 1884, conferred household suffrage on residents in the counties, the smaller boroughs with less than 15,000 were deprived of their members, and the seats thus obtained were divided among the more populous towns and districts. At the same time an addition of 18 members was made to the House of Commons, thus bringing the number up to 670.

REFORMATORY. Children under sixteen years of age, convicted of crimes and sentenced to certain terms of imprisonment, may be sent to a reformatory selected by the court which passes the sentence. The expenses of these reformatories are met by the government, by local rates, and by payments levied on the parents or guardians of the offenders.

REFRACTION OF LIGHT. When a ray of light passes out of one transparent medium into another of different density its path is bent, that is, the ray is refracted. Thus a ray passing out of air into water is refracted, as is also a ray passing out of water into air, as is seen in the broken appearance presented by an oar in water. In the latter case, refraction causes a lake or river to appear shallower than it really is.

REFRIGERATED FOOD. Of late years vast quantities of fresh beef and mutton have been brought to England in cold chambers. These chambers are cooled by air, which is first compressed and then cooled, by means of water poured over the vessel containing the compressed air. This air is then permitted to expand and to enter pipes circulating through the refrigerating chamber, which contains the meat. By this expansion acting against the resistance of the air already in the pipes, the air does mechanical work, and thus its heat is used up as mechanical energy, and it becomes intensely cold. In this way the air in the refrigerating chamber is kept down to a very low temperature even in the tropics, and the frozen meat is brought to England in a perfectly fresh condition.

REGALIA is the name given to the outward signs of royalty, such as the crown, sceptre, orb, swords of justice and mercy, the ampulla containing the anointing oil, the anointing spoon, and the regal vestments. It is at the coronation only that all these are brought into requisition, though some of them are used on other state occasions. They are on view at the Tower of London.

REGENERATION. (1) In a theological sense regeneration means "new birth," and, according to the teaching of the Church of England, expresses that change of state which takes place at Baptism, when the person baptised is made "a member of Christ." Many Christians, however, identify the term with "conversion," and limit its application to those who give evidence of actually living in Christ. (2) In a biological sense it means the renewal of lost parts in animals. In most animals there is a constant renewal of the skin and hair; reptiles change their skins, and deer renew their antlers. But in many creatures regeneration goes much farther than this. Lizards renew their tails if these are lost, crabs and lobsters replace missing claws, and salamanders renew lost limbs, which have been amputated again and again.

REGICIDES, those who are in any way responsible for the death of a king or queen. In English history it refers to those who brought about the death of Charles I., among whom Cromwell, Ireton, and Bradshaw were chief. After the restoration the regicides, 81 in number, were punished in various degrees.

REGIUM DONUM (Latin—*royal gift*), was an annual grant of money by the government to Presbyterians and Nonconformists in England, Ireland and Scotland. The grant was discontinued in England and Scotland in 1859, and in Ireland in 1871.

REHOBOAM, son and successor of Solomon. When requested by his subjects to lighten their taxes, he threatened to increase them. Ten of the twelve tribes thereupon revolted and chose Jeroboam as their king. Thus the tribes were separated into the kingdom of Judah under Rehoboam, and the kingdom of Israel under Jeroboam, 975 B.C.

REICHSTAG is the legislative chamber of the German Empire. It consists of 397 members—that is one for every 100,000 people—elected by manhood suffrage. the voting being by ballot. The Hungarian parliament is also called the "Reichstag," and consists of a House of Magnates and a House of Representatives. The imperial

parliament of Austria is called a *Reichsrath*.

REID, MAYNE, a writer of boys' tales, *b.* in Ireland, 1818, *d.* 1883. He went to America at the age of 20, and served in the United States Army in the Mexican war of 1847. Returning to Europe he devoted himself to literature. His plots are mostly laid on the Mexican frontier, his description of its natural features being accurate and vivid. His thrilling tales have always been favourites with boys; "The Rifle Rangers," "The Scalp Hunters" and "The Headless Horseman" being among his best.

REID, THOMAS, *b.* 1710, *d.* 1796, Scotland's greatest Mental Philosopher, was the son of a Kincardineshire minister. He was educated at the Marischal College of Aberdeen, and was for ten years its librarian. In 1763 he was elected to succeed Adam Smith as Professor of Moral Philosophy in the University of Glasgow. In 1781 he resigned his chair to devote himself to the systematic exposition of his philosophy. In 1785 he published a treatise on "The Intellectual Powers of Man," and three years later, a second on "The Active Powers of the Human Mind." In these he sought to combat the scepticism of Hume, not by attacking his reasoning but by demonstrating the falsity of the assumptions on which his reasoning was based. Thus he founded what has been called the new school of Scottish Philosophy.

REIGN OF TERROR. This was a period of 420 days from May 31st, 1793, to July 28th, 1794, in which France was given over to a government of murderers. The chief of these were Robespierre, Danton, Hébert Couthon, and Carrier. An infamous 'Committee of Public Safety" daily sent to the guillotine batches of victims, many of whom were only *suspected* of enmity to the government. More than 30,000 people were beheaded in Paris alone.

REINDEER, a species of deer, native to the northern parts of the Old and New World. It is the most prized of the deer family, its flesh and skin being most valuable, while the domesticated reindeer furnishes milk, and is the draught animal of the polar regions. Both male and female are furnished with antlers.

REJECTED ADDRESSES. In October, 1812, Drury Lane Theatre was to be re-opened after its destruction by fire. The management offered a prize for the poem most suitable to be recited on the opening night. It occurred to James and Horace Smith to write a set of poems in parody of what the leading poets, as Wordsworth, Southey, Coleridge, etc., might be supposed to have sent in and had rejected. They were published in 1813 and attained an immense popularity.

RELICS are personal memorials of the great dead, especially of those distinguished in religion. Supposed fragments of the "true cross," of the crown of thorns, portions of bones, garments, books, instruments of torture, connected with the history of holy men are reverently treasured as relics.

RELIGIO MEDICI, a kind of confession of faith written by Sir Thomas Browne, a Norwich physician of Stuart times. He takes the reader into his confidence in matters of ordinary life, as well as of religion. The work is a fantastic medley of solemn reflections and outlandish digressions. He died in 1685.

REMBRANDT, *b.* at Leyden, 1607, *d.* 1669, a famous Dutch painter. He learnt painting in the studio of Van Swenburch, but commenced his career as an etcher. Settling in Amsterdam, he took pupils, at the same time producing from 30 to 40 etchings a year. His first great oil painting was the "Anatomical Lesson," painted when he was 25. The celebrated "Night Watch" was produced in 1642. He was one of the most interesting of the great artists, both in his subjects and their treatment.

REMONSTRANCE, THE GRAND. This was a summary of the illegal acts committed by Charles I. since his accession, followed by a scheme of proposed reforms. The first half of the Remonstrance passed the Commons with little opposition, but the last clauses which proposed to make radical changes in the Established Church were hotly opposed by the friends of the Church. In the end they passed by a narrow majority of eleven.

REMUS, UNCLE, an old plantation negro who is supposed to relate the plantation tales and folk lore collected by Joel Harris.

RÉMUSAT, COMTESSE DE, a French lady, wife of the Chamberlain of Napoleon the Great, and an attendant on the Empress Josephine. Her "Memories" give an insight into the court life of the First Empire.

RENAISSANCE, or "New Birth," is the name given to the great awakening of men's minds in the latter part of the 15th century. It was largely due to the revived study of the Greek and Roman classics, which led to broader views in art, religion and science. The study of classical literature led naturally to a taste for classical architecture. The Renaissance architecture, while imitating classical models, is still largely influenced by the Gothic style which preceded it.

RENAN, JOSEPH ERNEST, *b.* 1823, *d.* 1892, was a Breton and educated by the priests of his native village, of whom he says: "They taught Latin in the old fashion, but they sought above all things to turn out good men." After being trained for the Church, he found himself unable to accept its teaching, and therefore devoted himself to general literature. For a time he filled the Hebrew chair in the University of Paris. His work, entitled, "La vie de Jésus," caused an immense sensation. It was followed by a series of important works on the origin and progress of Christianity.

RENI, GUIDO, *b.* 1575, *d.* 1642, was one of the greatest painters of the Bolognese school. He was born at Bologna, and at nine years of age was set to work in the studio of the painter Calvert. After a time he joined the rival studio of Caracci, whose work he admired. Removing to Rome, he obtained the patronage of the Pope, Paul V. His best work in Rome is considered to be the fresco in the Rospigliosi Palace, "Phœbus and the Hours, preceded by Aurora." He spent the last years of his life in Bologna, where, through his mania for gambling, he was reduced to the condition of a picture dealer's hack.

RENNET, the inner lining of a calf's stomach. It yields a juice which causes milk to curdle. It is taken from the stomach as soon as the calf is killed, then salted and dried. When wanted, a small piece is cut off and soaked in water, which is then added to the milk to be curdled. An extract of rennet is also extensively used.

RENNIE, SIR JOHN, was a famous engineer. Starting as a workman for Meikle, the inventor of a Thrashing Machine, he attended lectures at the Edinburgh University. Then he worked for Boulton and Watt, at Soho, near Birmingham, and distinguished himself by his ingenuity, especially as a millwright. This made him known, and brought him many commissions. The construction of bridges, canals, and docks next engaged his attention, and in all he was eminently successful. Waterloo Bridge, in London, is among the many monuments of his skill.

REPOUSSÉ is a method of ornamenting metals by blows delivered from the back. Punches of various shapes are used, and the design is thus raised above the surrounding surface of the metal. The more delicate portions of the work are executed from the front by the aid of gravers or punches. The metal to be operated on is placed on the surface of a block of pitch, or other yielding material.

REPRESENTATIVES, HOUSE OF, the Lower House of the United States Congress, comprising (1903) 386 members, chosen every second year by the people of the several States. This House, like the British House of Commons, has the sole power of originating bills for raising revenue.

REPTILES. These form one of the five classes of the vertebrate animals. They breathe by means of lungs, and are allied to the birds on the one hand and the amphibians on the other, and through the amphibians to the fishes. The amphibians, in the earlier stages of their existence, breathe by means of gills, but in the adult state by means of lungs. We may therefore consider them to begin life as fishes and end it as reptiles. The reptiles have been divided into four natural orders (1) Ophidia or Snakes, (2) Crocodilia or Crocodiles and Alligators, (3) Lacertilia or Lizards, (4) Chelonia, comprising Tortoises and Turtles.

REPUBLICAN PARTY (United States). In 1856 a party calling itself by this name was formed for the purpose of limiting slavery to the States in which it then existed. The opposite or Democratic party was in favour of extending it. The antagonism of these two parties in 1861 led to civil war. The Republican party triumphed, and slavery was abolished throughout the States. The Republicans and Democrats now differ only on the question of tariffs, the former being strict protectionists, and the latter advocating a certain amount of free trade.

REREDOS, the ornamental screen or wall which is placed at the back of the altar. It is often adorned with figures.

RESINS. These are vegetable secretions found in a large number of plants, mostly in solution in an essential oil. Thus common resin is found in pine trees dissolved in turpentine. Resins are insoluble in water, but soluble in alcohol. Many such solutions are used as varnishes. Ordinary resin, Dammar, Copal, Mastic, Sandarach are examples of resins. Amber is a fossil resin.

RESPIRATION is the natural process by which animals take in oxygen and give out the waste product of their tissues, mostly as carbon dioxide and water. Respiration is effected in some animals by the general surface of the body; others, as in insects, by tubes called tracheæ, which open on the body surface by spiracles. Creatures living beneath the water breathe mostly by means of gills; while reptiles, birds, and mammals breathe by lungs, as do also adult amphibia. (See *Frog.*)

RESPONSIONS. Refer to *Index*.

RESZKÉ, JEAN DE, *b.* at Warsaw, 1852, a celebrated operatic tenor singer. Like Sims Reeves, he appeared first as a baritone. His brother EDOUARD, *b.* 1855, is almost equally famous as a baritone. The two brothers caused a great sensation in London when singing at the Royal Italian Opera.

RÉUNION, an island belonging to France, formerly "Ile de Bourbon," one

of the group of islands lying to the east of Madagascar. It is mountainous, and has one very active volcano. It produces coffee and vanilla, but its chief export is sugar; capital, St. Denis.

REUSS, a tributary of the Aar, rising in the northern slope of Mount St. Gothard and making its way down a wonderful gorge, where it is crossed by the Devil's Bridge, after passing Andermatt. It flows through the Lake of Lucerne, and joins the Aar near Brugg after a course of 90 miles.

REUTER, BARON PAUL JULIUS, *b.* at Casel, 1821, *d.* 1904. In 1849 he organised at Aix la Chapelle an office for collecting and distributing political and commercial news. In 1851 he removed his head quarters to London. As telegraphs extended, he widened his field of operations, employing special messengers in important centres beyond the reach of the telegraph. In 1871 he was made a baron of Germany.

REVELS, MASTER OF THE, a former Court officer whose function it was to regulate the amusements provided for the Christmas season. He also attended the sovereign on a royal progress to see that the temporary accommodation provided was adequate, as well as to supervise the various masques and pageants generally arranged for the occasion.

REVENUE, NATIONAL. Refer to *Index*.

REVERE, PAUL, was a young mechanic born in Boston, Massachusetts, in 1735. He is known for his midnight ride, described by Longfellow. The English were about to march from Boston to Concord, on April 19th, 1775, to seize a quantity of military stores, and Revere rode forward the preceding night to warn his comrades. The battles of Concord and Lexington fought that day were the first of the war.

REVERSION is the tendency in plants and animals to exhibit the character of some ancestral form. An egg from a pure breed of pigeons may yield by reversion the original blue rock. A cultivated flower may produce blossoms like those of the wild plant from which it sprang.

REVERSIONARY ANNUITIES. These are annuities which are to commence at a given future time, or on the failure of a life or a combination of lives. They continue payable during a given time or during the lifetime of a given person or persons. Thus an annuity left to a son, to be paid after the death of his parents, is a reversionary annuity.

REVIVAL OF LEARNING. See *Renaissance*.

REVOCATION OF THE EDICT OF NANTES. Henry IV. of France inaugurated his reign by the issue of the famous "Edict of Nantes," 1598, granting perfect freedom to all Protestants, and placing them on an entire equality with Catholics. Louis XIV., in 1685, revoked this edict, despoiled the Huguenots of all their civil rights, and subjected them to a cruel persecution.

REVOLUTION. (1) THE ENGLISH REVOLUTION OF 1688 led to the abdication of James II. and the election of William of Orange to be King of England in his stead. The revolution was caused by the Roman Catholic sympathies of James, and the terms of the election of William III. secured for England a succession of Protestant princes. (2) THE FRENCH REVOLUTION OF 1789. [Refer to *Index*.] (3) REVOLUTION OF JULY. Charles X. of France issued on July 26th, 1830, six ordinances, in which, among other tyrannical acts, he suspended the liberty of the press and disfranchised eight out of every nine voters. A revolution followed, and Charles fled to England. (4) REVOLUTION OF 1848. Louis Philippe succeeded Charles X., but, after reigning 18 years, he had become so unpopular, that he was forced to abdicate, February 24th, 1848. He died in England two years later.

REYNARD THE FOX is a popular epic poem in which the characters are beasts instead of men. The hero is the Fox who constantly by his cunning outwits Isengrin the wolf. The tales seem to have originated in the north of France, or in Flanders, about the 10th century. Some Flemish and Low German editions reach a high literary standard.

REYNOLDS, SIR JOSHUA, *b.* at Plympton, Devon, 1723, *d.* 1792; an eminent painter. At the age of eighteen he went to London and entered the studio of Robert Hudson, a portrait painter. He next went to Rome, where he studied the works of Raphael and Michael Angelo. In the Vatican he caught a chill, which resulted in deafness. Returning to London he soon attracted notice, and his studio in Leicester Square became a meeting place of Burke, Johnson, Boswell, and the literary wits of the day. His portrait of Mrs. Siddons as the Tragic Muse, his "Strawberry Girl" and "Simplicity" have obtained world-wide celebrity. He was the first President of the Royal Academy, and was knighted in 1769.

RHADAMANTHUS, the mythical son of Zeus, was made judge in the lower world with Æacus and Minos.

RHÆTIA, an Alpine province of ancient Rome. It included the modern Grisons, Tyrol, and Southern Bavaria. Its name survives in the Rhaetian Alps.

RHEIMS, a city of France, 82 miles north-east of Paris. Cæsar speaks of it as the capital of the Remi, whence its name. Its magnificent cathedral is renowned throughout the world. In the ancient church that occupied its site Clovis was crowned in 496, and in the cathedral most of the French kings were crowned, including Charles VII., through the heroic conduct of Jeanne d'Arc. Rheims is celebrated for its woollen goods, and is one of the centres of the champagne trade; population exceeds 100,000.

RHETORIC has been described as the "Science of Persuasion." It attempts to lay down rules for compositions written or spoken, intended to sway the feelings and convince the minds of the hearers or readers. Thus it deals with style, with accuracy of expression, with the proper arrangement of arguments, the use of figures of speech, etc.

RHINE, THE, rises in Mount St. Gothard, flows through Lake Constance, and forms the northern boundary of Switzerland. Turning north at Basle, it flows between the Black Forest and Vosges Mountains, traverses Western Germany, flows through Holland, and enters the North Sea. It is navigable by steamer below Mannheim. Between Bingen and Bonn the scenery is highly romantic. After leaving Cologne, the largest city on its banks, it flows through a busy manufacturing district, passing Düsseldorf. On entering Holland it divides into several branches, the two chief of which being the Waal and the Leck; total length 760 miles.

RHINE, CONFEDERATION OF THE. When Napoleon defeated the combined forces of Russia and Austria at Austerlitz in 1805, he obtained unlimited power on the Continent. Hence he was able to sweep away the German Diet, and combine fourteen German States into what he called the Confederation of the Rhine, under himself as Protector.

RHINE PROVINCE or **RHENISH PRUSSIA.** This, the most populous and the busiest manufacturing district of Prussia, lies along its western border, touching Luxemburg and the Netherlands. The capital is Coblenz, at the junction of the Moselle and Rhine. Bonn, Köln, Trier, Essen, Aachen, Crefeld, Barmen, Elberfeld, and Dusseldorf are also important towns. Essen is the centre of a coal and iron district, and contains the celebrated "Krupp" cast-steel works, famous for the manufacture of heavy guns, etc.

RHODE ISLAND, one of the thirteen original states of the American Union, and of all the American States the smallest and most densely populated; it has extensive manufactures of cottons and woollens. The capital is Providence, a large manufacturing town. Area, 1,250 square miles; population about 450,000.

RHODES, an island in the Greek Archipelago, 50 miles long by 20 wide. It was originally peopled by Greeks, but afterwards passed into the hands of the Persians, Saracens, and Knights of St. John. By these last it was held for two centuries, and was finally surrendered by them to the Turks, who still hold it. Its capital, Rhodes, at the north end of the island, was long celebrated for its Colossus—a gigantic statue of Helios, bestriding the entrance to one of its harbours. The trade of Rhodes is now small, its fine harbours being sand-choked and neglected.

RHODES, CECIL JOHN, *b.* at Bishop Stortford, Herts, 1853, *d.* at Cape Town, 1902; was educated at the Grammar School of his native town. Being in delicate health, he joined his brother, a planter, in Natal. Attracted to the Kimberley diamond mines, he acquired a fortune, returned to England, and became a student at Oriel College, Oxford, where he took his degree. He went back to South Africa, and sat in the Cape House of Assembly, as member for Barkly. As Premier of Cape Colony, he devoted himself to the reconciliation of the two races—British and Dutch—in that Colony, and to the extension of the British Empire in South Africa. To this great patriot England owes the extension of her Empire from the Transvaal to the Zambesi, and far beyond it to Lake Tanganyika, over a vast region called in his honour *Rhodesia;* to him also she owes the possession of Walfisch Bay, the best harbour on the south-west coast of Africa. His tomb is in the Motopo Hills, near Bulawayo. By his will the bulk of his vast fortune was devoted to the founding of scholarships at Oxford for students from the Colonies and the United States.

RHO'DOPE (o-pe) **MOUNTAINS,** called also the Despoto Dagh, a range forming the boundary between Thrace and Macedonia. They rise to a height of over 9,000 feet in Mus Alta, on the extreme western border of Eastern Roumelia.

RHONE GLACIER. This glacier lies on the western flank of Mount St. Gothard. Moraines and perched blocks show that the glacier once occupied the whole of the space between the Bernese and Pennine Alps and extended westward to the Jura, throwing off two branches, one westerly towards France, the other northerly as far as Berne.

RHONE RIVER. This, the swiftest stream in France, rises in the Rhone Glacier, in Switzerland, and flows through the Lake of Geneva, in which it leaves its glacial mud. It emerges from the lake a clear stream and runs in a zigzag course westerly to Lyons, where it is joined by the sluggish Saone. Thence its course is southerly, till it enters the Mediterranean by many mouths after a course of 490 miles. Geneva, Lyons, and Avignon are the chief towns on its banks.

RHUBARB. See *Med. Dict.*

RHYL is a watering place in Flintshire, on the mouth of the river Clwyd. It has fine sands, and a promenade nearly half a mile long. From it there are fine views of Snowdon.

RHYME, or **RIME.** The recurrence of the same sound at the end of two or more lines of poetry constitutes rhyme. A true rhyme demands that the vowel and what follows it should be the same, as in "flown" and "moan," but that the consonant preceding should be different. Words such as "tearing," "declaring," make a double rhyme; "unfortunate" and "importunate" a triple rhyme.

RHYTHM, in poetry is the regular recurrence of accent in a line which gives its character to the metre; in music it is the ordered recurrence of an accented beat or beats in each bar. Dancing also, is entirely dependent upon rhythm, a certain number of movements recurring again and again in a very marked manner.

RIALTO, BRIDGE OF THE, a bridge over the Grand Canal in Venice. It was built in 1591, and consists of a marble arch 91 feet in span. Shakespeare, in his "Merchant of Venice," makes the Rialto the meeting place of Venetian merchants.

RIBBON SOCIETY. This was one of the Irish secret societies which were common between 1820 and 1870. "Ribbonism" was strongest between '25 and '35. The Ribbon men were almost entirely peasants and differed in their aims in different parts of Ireland. In the north they were merely the opponents of the Orangemen, in the west the agitation was purely agrarian, while in Leinster "Ribbonism" was trades unionism of a violent kind.

RICARDO, DAVID, *b.* in London, 1772, *d.* 1823; was of Jewish descent. After making a large fortune on the Stock Exchange he devoted himself to the study of Political Economy, publishing in 1817 a valuable work on the subject, entitled "Principles of Political Economy and Taxation."

RICE. One of the most widely cultivated of the cereals, forming the staple food of at least a third of the human race. It was probably native to India, but is now cultivated wherever there is sufficient heat and moisture. It is grown in vast quantities in the great deltas and low alluvial plains of India, Burma, China, Japan and Java. The hot swamps of Carolina and the well-watered plain of Lombardy are also famous rice-growing districts. Rice when fermented yields an alcoholic liquor named *arrack*, well-known in the East Indies.

RICEPAPER, a paper made, not from any part of the rice plant, but from the pith of a tree growing in the island of Formosa. The stem is cut into lengths, and the pith pushed out. Then the latter is very skilfully cut into a kind of very thin spiral, which is afterwards flattened out. The paper made from rice-straw is much coarser and more uneven.

RICHARD I., son of Henry II., king of England, 1189–99. Brought up in Poitou among knights and troubadours, he imbibed the romance of the times. He joined the Third Crusade, and his deeds in Palestine aroused the greatest enthusiasm in Christendom. In returning from the Holy Land he was imprisoned by the Archduke of Austria, but was ransomed by his English subjects. He was killed by an arrow while besieging the castle of Chaluz in 1199.

RICHARD II., son of the famous Black Prince, reigned 1377–99. Though as a boy of 15 he showed great courage during Wat Tyler's rebellion, he became weak and yet tyrannical, and was at length deposed in favour of Bolingbroke, son of John of Gaunt, Richard's uncle. The fate of the deposed king is uncertain, except that he ended his days in Pontefract Castle soon after his deposition.

RICHARD III., son of Richard, Duke of York, reigned 1483–85. On the death of his brother, Edward IV., he was made Protector of the realm, as Edward's son and successor was only twelve years of age. Richard imprisoned the young king and his brother in the Tower, where they were murdered. The usurper was defeated and slain at Bosworth-field, Leicestershire, in 1485, by Henry, Earl of Richmond, a Lancastrian prince, who was crowned on the battle-field under the title of Henry VII. [See *Richmond, Earl of.*]

RICHARDS, BRINLEY, *b.* 1819, at Carmarthen, *d.* 1885; was a composer and teacher of music who did much to encourage the study of music in his native Wales. He received his musical education at the Royal Academy, in which he became a professor. Two of his best known compositions are "The Harp of Wales" and "God bless the Prince of Wales."

RICHARDSON, SAMUEL, *b.* 1689, *d.* 1761; was one of the best known novelists of the 18th century. He was the son of a joiner, and was apprenticed to a printer. In 1719 he started a printer's business in Salisbury Square, and became famous as the author of a novel, "Pamela," which is written in the form of letters, and is said to have been at first intended as a guide to letter writers. Two other novels, "Clarissa Harlowe" and "Sir Charles Grandison," also written in letter form, helped to make him famous. He excelled in the delineation of female character.

RICHARDSON, SIR BENJAMIN, *b.* 1828, *d.* 1896; a distinguished physician and writer on medical subjects, was educated at Glasgow and at St. Andrews University. He did much by his writings and lectures to promote the cause of temperance and observance of the laws of health. He invented the lethal chamber for dogs, and a mask for workers as a protection from metal dust, etc. He was knighted in 1893 in recognition of his public services.

RICHELIEU, CARDINAL, *b.* 1585, *d.* 1642; was a celebrated French statesman. In 1616 he became secretary of state and for 18 years (1624–42) was the chief minister of Louis XIII., who resigned to him all real power. Richelieu aimed at three things (1) to reduce the power of the Protestants, (2) to enforce the submission of the turbulent nobles, (3) to humble the house of Austria. In all these he was successful, and at his death, in 1642, left France the most powerful nation in Europe.

RICHMOND. There are at least three well-known towns of this name. (1) Richmond in Yorkshire is beautifully situated on the Swale. It is noted for its fine Norman Castle now used as barracks. The Earldom of Richmond was granted by Henry VI. to the father of Henry VII. The view of the castle, and the bridge across the Swale below, is a favourite subject with artists. (2) Richmond in Surrey was formerly known as Shene. In its palace, rebuilt by Henry VII., and hence called Richmond, Elizabeth spent part of her infancy, and there she died. The view over the valley of the Thames from Richmond Hill is celebrated. (3) Richmond in Virginia, situated on the James river, was in the early part of the Secession War (1861–64), the head quarters of the southern army under General Lee. The falls of the James river supply power for the industries of Richmond, which has foundries, rolling mills, and tobacco factories.

RICHMOND, EARL OF. The first Earl of Richmond was Edmund, son of Owen Tudor, a Welsh gentleman, and Catherine, the widow of Henry V. Their son Edmund was created Earl of Richmond by Henry VI., and his son Henry, Earl of Richmond, became Henry VII.

RICHMOND, SIR WILLIAM, *b.* in London, 1843; English painter, elected R.A. in 1895, and president of the Society of Miniature Painters in 1899. He was founder of the Grosvenor Gallery. His decoration of St. Paul's Cathedral, begun in 1891, has been variously criticised.

RICHTER, JEAN PAUL, *b.* 1723, *d.* 1825, a German humorous and satirical writer, was educated for the ministry, but soon gave up theology for literature, which, however, provided him with a poor living at first. By about 1795 his name became known, and thenceforward till his death he was in easy circumstances. The admiration of Carlyle for Jean Paul's works first drew attention to him in England, but he is now appreciated only by those who face the difficulties of studying him.

RIDLEY, NICHOLAS, bishop of London, *b.* 1500, *d.* 1555, was one of the most prominent of those who suffered for the Protestant cause in the reign of Mary I. He had travelled on the Continent as a young man, and there he became acquainted with the aims of the Reformers. In Henry VIII.'s reign he showed his reforming zeal, and through Cranmer's favour became bishop of Rochester. Under Edward VI., as bishop of London, he did much to help on the Reformation, and was therefore marked out as an early victim when Queen Mary came into power, and on October 11th, 1555, with Latimer, he was burnt at Oxford as a heretic.

RIEL, LOUIS, leader of two rebellions in Canada against British rule. The first, or Red River rebellion, in 1869–70, was put down by Colonel (now Lord) Wolseley. The second was a general rising of the French half-breeds, had its centre in Manitoba, and was put down by General Middleton at the head of the Canadian Militia. Riel was afterwards executed at Regina.

RIENZI, COLA DI, *b.* 1313, *d.* 1354, the great Roman tribune, was the son of an innkeeper at Rome. He showed great talent, and received a good education, in gaining which he learnt how far Rome had fallen from her once high estate. Fired with enthusiasm, he resolved to put down the nobles and free his fellow-citizens from their tyranny. The sanction of the Pope made this feasible, and in 1347 he was made tribune of Rome and granted full power over his fellow-citizens on the understanding that his rule was to be in accordance with the constitution which he produced for their sanction. But his head soon grew giddy with his elevation, and acts of despotism paved the way for his fall. After seven months of power he fled. He returned again in 1354, but his former faults were accentuated rather than eliminated, and a popular rising ended in his assassination.

RIFLE ASSOCIATION, NATIONAL. See *National Rifle Association.*

RIFLES. A rifle is a musket which has grooves cut inside the barrel proceeding in a spiral direction from the breech to the muzzle. The object of these grooves is to impart a rotary motion to the bullet, so that it flies much truer to the mark than a bullet from a smooth bore. The advantage of the rifle over the smooth bore was known so early as the 14th century, but no attempt was made to arm soldiers generally with it till the middle of the 19th century. Cannon also are rifled.

RIGA, a Russian seaport near the mouth of the river Dwina, which flows into the

Gulf of Riga, an arm of the Baltic Sea. It has a very large import and export trade, the two together totalling about £10,000,000. The port is closed by ice for about four months in the year, but the numerous manufactures in the city provide employment for many of the dock workers. Corn, timber, flax, hemp, and linseed are largely exported; coal, wine, and manufactured goods form the chief imports; population over 280,000.

RIGHT OF WAY. Refer to *Index*.

RIGHTS, BILL OF. See *Declaration of Rights*.

RIGHTS OF MAN, DECLARATION OF THE, a document adopted by the French National Assembly in 1798, declaring that all men had equal rights, and ought to have equality of opportunity at the hands of the State. After Burke had published his "Reflections on the French Revolution," Thomas Paine issued "The Rights of Man," a book vindicating the Revolution.

RIGI, a mountain in Switzerland, between Lakes Zug and Lucerne. The views from the Rigi are exceedingly fine, and as the ascent is not difficult, and a railway leads to the summit, thousands of tourists ascend the mountain every year. Height 5,900 feet.

RINALDO, the first serious work of Tasso, the great Italian poet, was published in 1562, when he was only eighteen. It is a poem of many beauties, and at once stamped its author as the coming poet of the age.

RING. The wearing of metal rings on various parts of the body as ornaments dates from very early times. It must not be forgotten, however, that a ring forms a very convenient form of portable treasure; the women of India, indeed, almost invariably put their savings into this form. There is no doubt that before the invention of coins, rings were used as a means of exchange. This seems to have originated with the Egyptians, and paintings still exist showing the weighing of the money rings. Among the Gauls and Britons, Cæsar found the same use, and traders with Africa to-day have rings of copper made to exchange with the natives. The use of signet rings dates far back beyond the general use of writing. It was obviously so convenient to carry about something which could be used as an unmistakable token of the owner's identity, or with which he could make a mark on a soft substance like wax in order to establish his personality. The use of poison rings amongst the Italians of the Middle Ages seem to have been widely spread. The origin of the marriage ring is not very clear; it was certainly used among the Jews previous to the Christian Era.

RING AND THE BOOK, THE, the most important of Robert Browning's longer poems, was published in 1868. The scene of the poem is laid in Italy, and the minute portrayal of the motives and feelings of each actor in the tragedy are wonderful. The poem contains over 20,000 lines.

RING DES NIBELUNGEN, a set of operas by Wagner, consisting of the "Die Walkure," "Siegfried," and the "Gotterdammerung," with "Rheingold" as an introduction. The plot is taken from the "Nibelungenlied," or the song of the Nibelungs, a great, early German epic poem. Wagner's treatment is worthy of his great subject, but the length of the whole sequence is too great to allow its frequent performance as a whole.

RIO DE JANEIRO, the capital of Brazil, and the most important town in South America, is beautifully situated on an inlet of the same name on the east coast of the Continent. The harbour is one of the finest in the world, and the scene, when one has passed the narrow entrance to the harbour, one of the most beautiful. The city is not a handsome one, nor healthy, yellow fever being very prevalent. Its commercial importance, however, is very great, half the imports and exports of Brazil, to the value of £17,000,000, passing through it. The population of the city and suburbs, covering an area of 540 square miles, is nearly 600,000.

RIO DE LA PLATA, or Plate River, is really an estuary, on the coast of South America, receiving the waters of the rivers Parana and Uruguay, just as our river Humber receives the Ouse and Trent.

RIO NEGRO, the most important tributary of the Amazon on the left, or north bank, rises in the south-east of Colombia, and flows in a general south-easterly direction in a course of 1,350 miles to join the Amazon in about the middle of its basin. Its dark waters can be distinguished for a long time from those of the Amazon.

RIOT ACT. Refer to *Index*.

RIPON, a cathedral city of Yorkshire, on the river Ure, 22 miles from York. The cathedral, though not large, is handsome, and contains some interesting monuments. It was rebuilt under the direction of Sir Gilbert Scott. The manufactures of the town, especially that of spurs, have declined. Studley Royal, the fine seat of the Marquis of Ripon, is well worth a visit; within its grounds is Fountains Abbey; population about 8,000.

RIP VAN WINKLE, a story by Washington Irving, tells how Van Winkle, a careless, good-natured farmer, goes hunting, and falls into a sleep which lasts for twenty years. When he wakes, he falls into numerous mistakes until he gradually learns what has happened. Then he is much amused, and affords amusement by comparing existing things, manners, and men with those of twenty years ago.

RIVALS, THE, the first play produced by the great dramatist, Richard Brinsley Sheridan. It had not a great success at first, but afterwards gained great applause, and is now regarded as a classic.

RIVERS, the natural channels by which water that falls on to the land is restored to the sea, to be drawn up again by evaporation. The latter part of their course may be, and often is, through a plain, but the impetus derived from the sharp descent from the hilly country of their origin, keeps them in motion, as in the case of the Amazon, Ganges, Rhine, etc. The uses of rivers for navigation and irrigation need hardly be mentioned, but the advantage they afford in mountainous or hilly districts by supplying power to set machinery in motion should not be forgotten. The basin of a river is the whole area from which it draws water. The basin of the Amazon comprises two and a quarter million square miles; the Congo one and a half millions; the Nile and Mississippi each above one and a quarter millions. Some rivers never reach the open sea; their water is evaporated in some desert region; these are called *continental* rivers. The Volga and Oxus, which are of this class, fall respectively into the Caspian Sea and the Sea of Aral, which are in reality lakes.

RIVIE'RA. The word "riviera" simply means river-bank, or sea-shore. The name is, however, generally restricted to the shore of the Gulf of Genoa from about Toulon to Leghorn. The charm of this district is due partly to its natural beauties and partly to the mildness of the winter, the majority of days at that season being as fine as a fair English summer day. Hyères, Cannes, Nice, Monaco, Mentone and San Remo are the principal resorts. The gambling tables of Monaco are world-renowned.

RIVIERE, BRITON, *b.* 1840, a popular painter of the present day, excels perhaps in animal scenes, but paints all kinds of pictures with facility. "Daniel in the Lion's Den." "A Roman Holiday." and "Væ Victis." are among his chief works.

RIZZIO, DAVID, an Italian musician and linguist, born at Turin early in the 16th century. In 1561 he became secretary to Mary, Queen of Scots, and the favour shown him soon excited the anger of her husband, Lord Darnley, who with Ruthven and others burst into Mary's apartments and murdered Rizzio almost under her eyes.

ROADS, the great means of communication between one place and another, are one of the greatest civilizing agents known to man. Their importance from a military point of view was appreciated by the Greeks, and still more by the Romans; some of the roads, indeed, made by the latter being still in existence and well adapted for traffic. But with the departure of the Roman power, road-making as an art disappeared, not to revive until the beginning of the 19th century with Macadam and Telford. During the intervening years, the roads were merely tracks, impassable from mud in winter, and full of ruts in summer, so that in the 18th century it often took two hours to drive in a carriage from Kensington to St. James's Palace, a distance of three miles. The vast increase of locomotion in the last half-century has led to many experiments in road-making, with the result that the best country roads are now made of whinstone, or some similar material, while in towns "macadam" and the paving stone are giving place to wood and asphalt.

ROARING, in horses, is the utterance of a sound, sometimes like a slight whistle, sometimes much louder and deeper, as an accompaniment to the breathing. It is caused by disease in the larynx, which often becomes half choked up by the hardening of a discharge from the diseased part. There is no cure for roaring; once a horse begins it, he gradually gets worse and worse until he becomes unfit for work.

ROBBIA, LUCA DELLA, *b.* in Florence, 1400, *d.* 1482, a celebrated sculptor and modeller. Most of his work was of a religious nature, executed for the cathedral or churches of Florence. Some of his relief work on the doors and galleries of the cathedral has never been surpassed. But his name is best known in connection with the figures in enamelled terra cotta, a kind of work he brought to high perfection.

ROBERT, SURNAMED "THE DEVIL," was Duke of Normandy from 1027 to 1035. He succeeded his brother Richard, whom he is said to have poisoned. He made war successfully on his neighbours, and was feared as a bold and successful leader. Later he went on a pilgrimage to Jerusalem as a penance for his youthful sins, and died on the way back. His son William, afterwards William the Conqueror, whose mother was a farrier's daughter, succeeded him. The libretto of Meyerbeer's splendid opera "Robert le Diable" is founded on supposed incidents of his life.

ROBERT, DUKE OF NORMANDY, the eldest son of the Conqueror, became Duke of Normandy on his father's death, 1087, whilst his brother William (Rufus) became King of England. In 1096 he went on a Crusade. During his absence, William died, and Henry seized the crown. An attempt by Robert to gain the crown led to his capture and imprisonment in Cardiff Castle, where he died.

ROBERT I. See *Bruce, Robert.*

ROBERTS, EARL. Before the great Boer War of 1899–1902, the career of the great general was almost limited to India, where he was born in 1832. After receiving his education in England, he returned to India in 1851 with a commission in the Bengal Artillery. He was in the thick of the Mutiny in 1857–8, and gained the V.C. for his gallantry. He did good service in the organising and conduct of the Abyssinian Expedition of 1867, so good indeed that the honour of carrying home the final despatches was conferred on him. The Afghan campaign of 1878–80 gave Roberts, now Major-General, a splendid opportunity of showing his capacity, and never did general more thoroughly justify his appointment. His celebrated march from Cabul to Kandahar, a distance of 313 miles, in 22 days, will be long remembered. Honours were showered upon him, and as Baron Roberts of Kandahar and Waterford, and Commander-in-Chief of the Army in India, he seemed to have set the crown on a brilliant career. But the serious reverses of our troops in 1899, at the Tugela River and Magersfontein, called for fresh counsels. How Lord Roberts turned the scale of victory in our favour by the relief of Kimberley and the victory at Paardeberg will not soon be forgotten. Nor will it be forgotten how, within six months from his landing in South Africa, 1900, he led the British army in triumph into the capitals of the two Boer States. An earldom and a grant of £100,000 were the reward of Roberts's services in South Africa. His "Rise of Wellington" and "Forty-one Years in India" have been widely read and greatly admired.

ROBERTSON, FREDERICK WILLIAM, *b.* 1816, *d.* 1853, was intended for the army, like his father and grandfather before him. But feeling his vocation to be the Christian ministry, he went to Oxford to prepare for the ministry. In due time he became a curate, first at Winchester, then at Cheltenham and Oxford. For the last six years of his life he was incumbent of Trinity Chapel, Brighton. During his incumbency he preached a series of sermons which are still widely read and which have suggested to preachers of all denominations many lines of fresh thought. The intensity of his feelings probably hastened the brain disease which was undermining his strength. His eloquence is said to have been very striking, and it was assisted by a very musical voice capable of great expression.

ROBERTSON, WILLIAM, *b.* 1721, *d.* 1793, a great Scottish historian, was a minister of the Scottish Church. "The History of Scotland," "History of the reign of Charles V.," and "History of America," are his chief works. They brought him handsome pecuniary rewards, as well as commendations from the leading men of the time, and, though subject to correction to-day, are still worth reading for the penetration and acuteness they display in judging of the problems of history as they then presented themselves.

ROBESPIERRE, MAXIMILIEN, *b.* 1758, *d.* 1794, one of the chief actors in the French Revolution, was also one of its victims. Educated as a lawyer, he soon gained a hearing in the States-General. His rise, both in popularity and in power, was rapid, and by clamouring for the king's death, he gained the confidence of all who aimed at destroying the monarchy. In 1793 he became a member of the "Committee of Safety," and then began the notorious "Reign of Terror." For weeks his enemies and rivals were guillotined at the rate of thirty a day. By the end of a twelvemonth he had forfeited the confidence of his partners in the Government, and was himself sent by them to the guillotine.

ROBIN GOODFELLOW. See *Puck.*

ROBIN HOOD, the hero of several old English ballads, cannot be said with certainty to have had any real existence. No doubt, in the days of the Norman kings and their early successors, many bold yeomen haunted the greenwood, both in Sherwood Forest and elsewhere, setting the forest laws at defiance, and combining the occupations of the deer-stealer and the highwayman. And no doubt such men often formed themselves into bands under the leadership of such a chief as Robin Hood. The first mention we have of the Robin Hood ballads is in Langland's "Piers Plowman," written about 1360.

ROB ROY, "Robert the Red," a chieftain of the clan Macgregor in Scotland, about the beginning of the 18th century. For some time he called himself a Campbell on account of his own tribe having been outlawed. He joined the Pretender in 1715, but, not having been very prominent, he soon gained a pardon, and lived the rest of his life making covert war on the Duke of Montrose, under the protection of the Duke of Argyle. Scott's novel, "Rob Roy," gives a very life-like picture of the man and the times.

ROBSART, AMY, daughter of Sir John Robsart, and the unacknowledged wife of Robert Dudley, afterwards Earl of Leicester, the favourite of Queen Elizabeth. In 1560 she went to live at Cumnor place, under the care of one Forster, in the service of her husband, and one night she was found dead at the foot of the staircase, but the cause of her death can only be conjectured.

ROC, THE, a fabulous bird of such immense size and strength as to carry off even elephants in its talons. It is frequently mentioned in the "Arabian Nights," and its existence was at one time widely credited.

ROCHDALE, an important manufacturing town of Lancashire, on the river Roch, about 11 miles north of Manchester. Besides its cotton industry, it has an important flannel manufacture dating back to Edward III. But its chief title to fame is the fact that it was the birthplace of the co-operative movement, its now flourishing society having commenced in 1844 with twenty-eight members. (For population, etc., see p. 902.)

ROCHELLE, LA, a seaport of France on the Bay of Biscay, opposite the Isle de Ré, and about 90 miles north of Bordeaux. It has, for its size, considerable trade, both coasting and oversea, the imports and exports together totalling three and a half millions. The chief export is brandy. It was a Huguenot stronghold, and the employment of English ships against it caused great indignation against Charles I. in 1626.

ROCHES MOUTONNÉES, the name given by Swiss peasants to rounded rocks, possessing a fancied resemblance to sheep lying down. In Scotland they are called "grey wethers." Such rocks have been smoothed by the grinding action of the glacier on the surface of the rocks over which they travelled.

ROCHESTER, a cathedral city of Kent, on the right bank of the Medway, near its mouth. It really forms one large town together with Chatham and Strood. It possesses considerable historical interest, the cathedral having been founded by Augustine in 606, and some of the original building still remaining. Rochester Castle is a noble Norman ruin. Dickens, who lived at Gad's Hill, 3 miles away, frequently introduced Rochester into his novel; population 30,000.

ROCHESTER (John Wilmot), **EARL OF,** *b.* 1647, *d.* 1680; a witty and dissolute courtier in the reign of Charles II. He was the author of the memorable lines on Charles, beginning: "Here lies our sovereign lord the king." Good judges have declared his writings to show a talent that might have placed him among the first writers.

ROCHET, a fine linen vestment worn by bishops. It resembles a surplice, except that the sleeves fasten at the wrist instead of being open.

ROCKEFELLER, JOHN DAVISON, *b.* in New York, 1839; a multi-millionaire who owes his wealth to petroleum, first in consolidating many oil companies into the Standard Oil Company, 1870, and later in establishing the Standard Oil Trust, 1882. He has devoted a large share of his wealth to Educational purposes in the United States, and, in particular, no less than 2½ millions for technical training.

ROCKET, a cylindrical tube filled with inflammable material, the rapid combustion of which causes a great rush of gas out of an opening, or openings, at the base, and thus propels the rocket with great force. In war, rockets are chiefly used for setting buildings on fire, and to inspire terror. [See *Life-Saving Appliances.*]

ROCKY MOUNTAINS, the mountains which stretch almost continuously from the Arctic Ocean to the junction with Central America. They are parallel with the western coast of North America, and not far from it. The name is sometimes restricted to the more easterly ranges, while those quite near the coast are called Cascade Range and Sierra Nevada. The highest peaks are in British Columbia, where Mount Hooker and Mount Brown attain a height of about 17,000 feet. A peculiar feature of the Rocky Mountains is the plateaus enclosed between the several ranges. Yellowstone Park, amid these mountains in the north-west of Wyoming, probably contains as fine scenery as the world can show. The Rocky Mountains are especially rich in deposits of gold, silver, and other metals.

ROCOCO, a name given to a style of decoration prevalent in the early and middle parts of the 18th century. Its characteristic may be said to have been excess of detail in ornament without unity of design.

RODENTIA, an order of animals embracing all those that gnaw their food. Rats, mice, squirrels, hares, rabbits, porcupines, guinea-pigs, and beavers, with many others, are included in the order. Their characteristic is the peculiar sharpness of the front teeth, which, being covered with enamel only in front, wear away quickly at the back, and so present the knife-like edge formed by the enamel.

RODNEY, GEORGE, LORD, *b.* 1718, *d.* 1792, a famous English admiral, entered the navy at the age of twelve. By the time he was twenty-four he had gained the rank of post-captain. He served with success in most of the wars of the time, but his greatest services were the relief of Gibraltar, in 1780, and his victory over the French under De Grasse off Dominica in the West Indies in 1782. The latter service was rewarded with a peerage and a pension of £2,000 a year.

RODOMONT, a character in the "Orlando Furioso" of Ariosto. He is represented as a very brave and fierce knight, but given to bragging, whence his name is used to denote a bragger, or boaster, and indulgence in bragging is often designated "Rodomontade."

ROE, RICHARD. See *Doe, John.*

ROGATION DAYS, the Monday, Tuesday, and Wednesday before Ascension Day. They were so called because of the solemn "rogations," i.e., supplications or litanies, recited in early times on those days. Before the Reformation the Litany used to be said or sung in a solemn procession, and a trace of this custom remains in "beating the bounds," which is still done in some places on Ascension Day.

ROGER DE COVERLEY, SIR, a delightful creation by Steele and Addison. He is the chief character in the Club professing to write the "Spectator," and the ideal portrait of an English gentleman of the reign of Queen Anne, when the "Spectator" was published.

ROGERS, JOHN, *b.* about 1500, *d.* 1555; the first Protestant martyr in the reign of Mary. He was converted by Tindal at Antwerp, and afterwards assisted the latter in his English translation of the Bible. He returned to England and obtained a prebendal stall in St. Paul's Cathedral. He was burnt at Smithfield.

ROGERS, SAMUEL, *b.* 1763, *d.* 1855, a leading poet of the first half of the 19th century, made his name in 1792 by his poem "The Pleasures of Memory." His next great work was "Human Life," published in 1819, a poem abounding in many happy phrases. "Italy," considered by many his finest work, was published at intervals between 1820 and 1830. A handsome fortune, inherited from his father, enabled him to keep his work in his own hands until he had polished it to his satisfaction.

ROIS FAINEANTS, the later Merovingian kings of France (656-751). They were called "Fainéants" (do-nothings) because they were content to leave the government of the country in the hands of their chief ministers, who were called "Maires du Palais."

ROJDESTVENSKY, PETROVITCH, *b.* 1848; a Russian admiral entrusted with the Russian fleet that sailed from the Baltic, October, 1904, to destroy the Japanese fleet. His exploit at the Dogger Bank (which see) is well known. In May, 1905, Rojdestvensky, with a great fleet of nearly 40 vessels, made for Vladivostok, through the Strait of Tsushima, between Corea and Japan. In the disastrous battle which took place here, he was wounded and taken prisoner (See *War, Russo-Japanese*).

ROKEBY, a small parish in Yorkshire on the river Greta, 10 miles north of Richmond. It forms the scene of Sir Walter Scott's poem of "Rokeby," in which he well describes the romantic scenery of the district.

ROLAND, the hero of many romantic old French ballads, was undoubtedly one of Charlemagne's knights. It is also pretty certain that in Charlemagne's retreat, or return, from Spain, the vanguard, commanded by Roland, was cut up almost to a man, and the leader slain. The rest of the story consists of additions made by the "jongleurs," or wandering minstrels.

ROLAND, MADAME, the wife of Jean Marie Roland, a minister of the ill-fated Louis XVI. Spurred on by his wife, Roland took an active part in the Revolution until the September massacres showed them how things were going. Their protests made them hateful to the Jacobins, and with others they were arrested, but Roland escaped. Madame Roland was guillotined, after five months' imprisonment, during which she wrote her "Memoires," which have thus a tragic interest, as being written under the shadow of the scaffold.

ROLLO, or ROLF, a Norwegian noble who harried England, Scotland and France towards the end of the 9th century. In 912, Charles the Simple, of France, was glad to cede to him the territory which we now call Normandy, and he thus became the founder of the Duchy of Normandy, and the ancestor of William the Conqueror. He was called Rolf the "Ganger" (or "walker"), being it is said, too long-legged to ride a horse.

ROLLS, MASTER OF THE. Refer to *Index*.

ROMAN CATHOLIC CHURCH, that part of the Christian Church which yields allegiance to the Pope. It ought, perhaps, to be pointed out that the members thereof do not themselves claim or use this title. They call theirs the "Catholic," i.e., the *Universal* church, the other Christian bodies prefixing the title "Roman," to assert their own claim to be part of the "Universal" church. No doubt the two chief epochs in the history of the Roman Catholic Church are the separation between East and West, which took place finally in 1054, and the great upheaval called the Reformation, in the 16th century, which resulted in the appearance of the various Protestant churches. Two great factors in the vitality of the Roman Catholic Church are the celibacy of the clergy and the complete ultimate subordination of every officer in it to the Pope. The first of these factors prevents any external interest from interfering with the interest of the Church, whatever sacrifice may be required to maintain or promote it: the second produces a practical unity of belief and action. Refer to "Roman Catholic Church," in *Index*.

ROMANCE. As now generally used, the term "romance" is used to denote a fictitious story, either in prose or verse, in which some, if not most, of the incidents border on the marvellous and impossible. In the 12th and succeeding centuries, stories in verse about Charlemagne, about Arthur, and about Amadis of Gaul became very popular with the upper classes, and as these were mostly written in one of the *Romance* languages, i.e., Spanish, French, or Italian, the name was applied to all such compositions.

ROMANCE LANGUAGES — Spanish, French, Portuguese, and Italian; so called because derived from the *Roman*, or Latin tongue.

ROMAN EMPIRE, THE HOLY, a term applied to the confederation of German States which, under the title of the Holy Roman Empire, held together more or less loosely from the time of Otho, who was crowned Emperor in 962, to that of Francis II. of Austria, who formally resigned the title in 1806.

ROMA'NES, GEORGE JOHN, *b.* at Kingston, Canada, 1848, *d.* at Oxford, 1894, a British naturalist. He has published "Animal Intelligence," "Mental Evolution in Animals," and "The Philosophy of Natural History before and after Darwin."

ROMANOFF, HOUSE OF, the present dynasty of Russian rulers; founded in 1612 by Mikhael Romanoff, a noble of Prussian descent.

ROMANY, the language spoken by Gypsies. It is curious that the language of true gypsies in every land is so nearly alike that a Gypsy from England can without much trouble understand the language of the Siberian Gypsy; and careful examination shows that Romany, though not derived from, is closely allied to, Sanscrit.

ROME, the capital of Italy, and for centuries the capital of the world, stands on the river Tiber, about 15 miles from the sea. How far its present interest depends upon its ancient importance and history would be hard to say, but undoubtedly few go to Rome, or mention it, without feeling that they have to do with a city that has a mighty past. The seven hills on which ancient Rome was built can still be traced, but the Campus Martius, which lay between them and the river, and which was the field of exercise for the early inhabitants, has long been built over. The remains which exist in the form of amphitheatres, baths, and circuses belong almost entirely to imperial times. The churches, pictures, and palaces are mostly of mediæval origin. The Vatican, probably the largest palace in the world, is near the west bank of the Tiber. It was begun in 1150, and has not long been completed. It is said to contain 11,000 rooms, and the treasures of art within its walls are marvellous. It is the seat of the Pope. The king's palace, the Quirinal, is on the east side of the river. The catacombs or underground burial places of Rome have long been celebrated. Here the Christians used to bury their dead, and taking advantage of the sacredness accorded to places of burial by the Romans, they held here, in times of persecution, their meetings for worship. It is said the length of the galleries, if all were placed in line, would amount to three or four hundred miles. The manufactures of Rome are few and unimportant; population exceeds 460,000.

ROMILLY, SIR SAMUEL, *b.* 1757, *d.* 1818, an eloquent and learned lawyer, is chiefly remembered for his persistent advocacy of the reform of the criminal law, especially with regard to the limitation of capital punishment, and the reduction of penalties for lesser crimes. He gained his knighthood for services rendered as Solicitor-general.

ROMNEY, GEORGE, *b.* 1734, *d.* 1802, portrait painter, was the son of a carpenter of Dalton, Lancashire. At twenty-one he began to learn painting, and in two years more he had married and set up as a portrait painter on his own account. In 1732 he left his wife and family and went to London, where for thirty-seven years he worked and made money. The story of his return in old age to his wife, and her forgiveness, is very touching. Some of his portraits are very celebrated.

ROMOLA, one of the most successful of "George Eliot's" novels, deals with the Florence of Savonarola's time. She succeeds in giving us some highly interesting characters, but they are not quite the Florentines of the 15th century.

ROMULUS, the fabled founder, with his brother Remus, of the city of Rome. The sons of King Numitor, of Alba Longa, they were placed by the usurper Amulius, on the Tiber's bank to die. After being suckled by a she-wolf they were rescued and reared by a shepherd. In 753 Rome was founded, and Romulus slew Remus in a quarrel. Romulus died after a reign of thirty-seven years, and was later worshipped under the name of Quirinus.

RONCESVALLES, the valley in Navarre where the rear of Charlemagne's army was cut off, and Roland was slain. In the church are shown many relics asserted to have belonged to Roland [See *Roland*].

RÖNTGEN RAYS, rays, probably of light, produced by passing a current of electricity through a highly exhausted vacuum tube. Unlike ordinary light, however, they possess considerable power of passing through opaque bodies, as paper, wood, metal. As a rule, the denser the substance the greater resistance it offers to the passage of the Röntgen rays; hence if one's hand is interposed between the vacuum tube and a photographic plate, the bones cast a deeper shadow than the flesh, and the same with coins in

a purse, etc. Hence the value of the rays in searching for bullets in the bodies of wounded men.

ROOD, signifies a cross. Anciently there was a rood or crucifix set up between the body of the church and the chancel. This was flanked with images on either side, generally of Saint John and the Virgin Mary, and the spaces filled with carved work. The carved work still remains in many cases, and forms the rood-screen.

ROOK is a common bird of the crow family. Its chief food consists of grubs, specially those of the cock-chafer, and it is thus useful to the farmer. It, however, eats grain, eggs, and even young birds, and so does harm to fields newly sown with corn and to game preserves. Rooks form colonies during the breeding season, building their nests in the tops of tall trees; the eggs are five in number, green with dark blotches, and are incubated by both sexes, which sit alternately.

ROOKE, SIR GEORGE, *b.* 1650, *d.* 1709, an English admiral, did good service at the battles of Beachy Head and La Hogue. In the War of the Spanish Succession, also, he distinguished himself greatly by destroying the combined fleets of France and Spain in Vigo Bay. His great service, however, to his country was the capture of Gibraltar in 1704, a prize whose value was not recognised at the time.

ROON, COUNT VON, *b.* 1803, *d.* 1879, a Prussian soldier and field-marshal, whose reforms and improvements in the army paved the way for the success of the Prussians in 1866 over the Austrians, and in 1870–71 over the French. His idea of a nation trained to arms is now practically universal on the Continent and in Japan.

ROOSEVELT, THEODORE, *b.* in New York, 1858; twenty-sixth President of the United States. Having finished his education at Harvard College, he tried the law first, then ranching. In both municipal and national politics he soon proved himself a fearless, able, and determined reformer. The outbreak of the war with Spain, for which as Secretary of the Navy he had long been preparing, gave him the opportunity to form and lead his "Rough-riders," who did such good service before Santiago. The assassination of President Mc.Kinley, 1901, gave him his first term of office as President, and paved the way to his election, in 1904, to a second term. He has the honour of having taken the initiative in bringing about peace between Russia and Japan.

ROOT-AND-BRANCH MEN, the party in the Commons who supported a petition presented in 1640 by 15,000 citizens of London, praying that Episcopacy might be destroyed "root and branch." Hampden, Sir Harry Vane, and Nathaniel Fiennes were the leaders.

RORKE'S DRIFT, a ford of the Tugela River, in Natal. Here Lieutenants Chard and Bromhead, with 80 men, kept at bay an army of 3,000 Zulus in 1879, after their annihilation of a British regiment at Isandlana.

RORQUAL, one of the commonest whales, often attains a length of 80 or 90 feet. Specimens are not uncommonly stranded on the British coasts. It does not produce so much oil as the Sperm Whale.

ROSA CARL, *b.* at Hamburg, 1843, *d.* 1889; an operatic impresario. In 1875 he formed a company to bring out standard operas in English. He also encouraged English musicians to write operas, inducing Mackenzie to write "Colomba" and "The Troubadour," and Stanford to write "Canterbury Pilgrims."

ROSAMOND, FAIR. See *Clifford, Rosamond.*

ROSA, SALVATOR, *b.* 1615, *d.* 1673, poet, musician, and painter, could have won distinction in either field. He is best known, however, as a painter, although his poems are still reprinted. His powers showed best in depicting wild scenes of Alpine grandeur.

ROSARY, a string of beads used by Roman Catholics as aids in remembering the number of times they have recited certain prayers and invocations. The use of beads for a similar purpose is common among Hindus and Mohammedans, and was introduced, it is said, into Europe by the Crusaders.

ROSCOE, SIR HENRY ENFIELD, *b.* in London, 1833; an eminent chemist and writer on chemistry, was educated at Liverpool University College, London, and Heidelberg. He was professor of chemistry at Owens College at 25, and F.R.S. at 30. His works on chemistry have a world-wide reputation, and he has done much to advance secondary and technical education.

ROSEBERY, EARL OF. See *Primrose, Archibald Philip.*

ROSE, SIR HUGH (Lord Strathnairn), *b.* 1801, *d.* 1885; a distinguished commander in India, where he gained great distinction in the time of the Indian Mutiny. By his skilful operations in Central India, he did much to localise the Mutiny, and to rehabilitate British authority. From 1860 to 1865 he was Commander-in-Chief of the army in India, and from 1865 to 1870 held the same post in Ireland. He was made a peer in 1866.

ROSES, WARS OF THE. See *Wars of the Roses.*

ROSETTA, a seaport town of Egypt, a few miles east of Alexandria. It is a great mart for the rice grown in the delta. As a port, its importance has almost vanished; population 16,000.

ROSETTA STONE, a stone found at Rosetta, a town at the mouth of the western branch of the Nile, containing an inscription in honour of Ptolemy Epiphanes in three forms: in Hieroglyphics, in the popular tongue of Egypt (Coptic), and in Greek. This acted as a key to the meaning of the hieroglyphics, and since then their interpretation has gone on apace. It was brought to England in 1802, and is now in the British Museum.

ROSEWOOD, a very hard and beautifully marked wood imported into this country from Brazil. It takes a fine polish and is very durable, and is much used as a veneer. The wood of an allied tree found in the East Indies yields East Indian rosewood. It derives its name from the odour the wood gives out when fresh cut.

ROSLIN, a small village in Scotland, 6 miles from Edinburgh, is famous for its beautiful chapel, built in 1450, and adorned with much fine carving. It contains the celebrated "Prentice Pillar."

ROSS, a small town in Herefordshire, 11 miles south-east of Hereford. Its chief title to fame consists in the fact that John Kyrle, Pope's "Man of Ross," lived here. His body lies in the handsome church of the town; population 3,500.

ROSS, SIR JOHN, *b.* 1777, *d.* 1851, English admiral and Arctic explorer, entered the navy at the age of nine. His chief services were rendered in the Polar Seas, where he took part in, or conducted, many exploring expeditions. His last voyage was an attempt to find Sir John Franklin, in 1850. His accounts of his voyages are very interesting.

ROSS, SIR JAMES, *b.* 1800, *d.* 1862, nephew to Sir John, followed closely in his uncle's footsteps as an explorer. He accompanied his uncle and Captain Parry in their Arctic voyages, but his fame was gained by the great Antarctic exploring expedition of 1839, in which he commanded the *Erebus*, and Captain Crozier the *Terror*. They spent four years in the Antarctic regions, and made most valuable observations. Sir James was knighted on his return.

ROSSE (William Parsons), **EARL OF,** *b.* 1800, *d.* 1867; the maker of the celebrated "Rosse" reflecting telescope, devoted himself early to the branch of work which gained him his fame. His great six-foot reflector, set up at Parsonstown, Ireland, in 1845, began to be used in 1848, and soon solved many astronomical problems, chiefly with regard to nebulæ. This great achievement brought Lord Rosse many scientific distinctions in England and from abroad.

ROSSETTI, DANTE GABRIEL, *b.* 1828, *d.* 1862, son of an Italian refugee from Naples, possessed in an eminent degree the characteristic southern temperament. Artistic in every fibre of his nature, he might have excelled either as a poet or a painter. His influence in painting has had great effect on the subsequent development of English art, for he was one of the pioneers of the *Pre-Raphaelite* movement. His wife's early death was probably the cause of his comparative failure in later years.

ROSSINI, GIOACHINO ANTONIO, *b.* 1792, *d.* 1868, a great Italian composer, was born at Pesaro, an Adriatic seaport. He took to music early, and had written much before he was twenty. His first lasting work was "Tancredi," produced in 1813, but the "Barber of Seville" (1816) far outshone it. "Semiramide" and "William Tell" complete the list of his masterpieces, but many more good operas came from his pen. His great *forte* was melody.

ROSYTH. See *Forth, Firth of.*

ROTATION OF CROPS. Long before chemistry was applied to agriculture, it was known that continual raising of the same crop from a piece of ground tended to "exhaust" the ground, while if different things were grown in turn, much greater crops resulted. The most common rotation of crops is the Norfolk system, under which they follow this order:—(1 clover or mixed grass, (2) wheat or oats, (3) roots (such as turnips and mangolds) or potatoes, or else the ground is left fallow, and (4) barley. Of course, the intelligent farmer does not blindly adhere to this, but his operations must be based on it, or on some similar system, to secure the best results.

ROTHAMSTED, seat of Sir John Bennet Lawes, near St. Albans. Here in 1843, with the assistance of Dr. (afterwards Sir) J. H. Gilbert, he began a series of experiments in farming and cattle-breeding, testing the effect of manures on crops and of various foodstuffs on cattle, etc. At his death, 1900, besides the experimental fields and laboratories, he gave £100,000 for the continuance of the research work.

ROTHESAY, a favourite seaside resort in the north-east of the Island of Bute, and the chief town of Buteshire. It has a splendid harbour and a very mild climate, and is a good centre for tourists.

ROTHSCHILD. This celebrated family of bankers attribute their rise to the proud eminence they occupy to Meyer Amschel Rothschild, a banker in Frankfort during the latter half of the 18th century. Setting aside the story of the landgrave's treasure hid in his garden, there is no doubt that Meyer made much money by negotiating loans during the Napoleonic wars. His son Nathan greatly extended the scope of the bank's operations. Lionel, his successor, did much towards

removing the civil and political disabilities of the Jews. The present head of the house, Nathaniel Meyer, was made a peer in 1885. His niece, Hannah, married Lord Rosebery.

ROTTEN ROW, a fashionable place for riding and driving in Hyde Park. Here, in "the season," from about 4 to 6 in the afternoon, may be seen the wealth and fashion of England walking, driving, riding or lounging. The name is derived from "route du roi" or "king's drive."

ROTTERDAM, the second largest city of Holland, is situated on the river Maas, about 19 miles from its mouth. The city is intersected with canals, along whose banks trees are planted, producing a very pleasing effect. Rotterdam is the chief seaport of Holland, trading largely with the East Indies, as well as with other places. It does a large trade with England in butter, cheese, eggs, and other food produce, and its river traffic is enormous. Erasmus, the celebrated divine, was born here; population exceeds 360,000.

ROUEN, the old capital of Normandy, and still an important town, is situated on the river Seine, about 80 miles by river from the sea. The old ramparts have been converted into handsome boulevards, but quaint old houses, the abbey, and the interesting cathedral, remain to give a flavour of antiquity to the town. The close connection of Normandy and England at one time makes Rouen very interesting to Englishmen. Here William the Conqueror died and Joan of Arc was burnt. As a port, Rouen comes fourth in France; imports and exports amounting to a total of nearly £11,000,000. It has important manufactures of cotton and hosiery; population 115,000.

ROUGH RIDER, in general, a horse-breaker. In the army, men are specially chosen out to help to teach riding to the cavalry recruits, and to break in horses for military purposes. These men are called rough-riders.

ROUMANIA, a kingdom in the south-east of Europe, bordering on the Black Sea. For boundaries it has the river Pruth and the Black Sea on the east, the Danube on the south, and the Carpathian mountains on the north and west. The northern part is called Moldavia and the southern Wallachia. Roumania was dependent on Turkey until 1877. Then Prince Charles joined the Russians in the great Turco-Russian war, and won independence for his country, which became a kingdom in 1881. Agriculture is very successfully carried on, and much corn and fruit are exported. The population amounts to six million, nearly all belonging to the Greek Church. Bucharest is the capital; population exceeds 250,000.

ROUNDHEADS, a name applied during the Civil War to the Parliamentarians, who wore their hair cropped short, whilst the Cavaliers generally had long flowing hair.

ROUND TOWERS, tall, strongly built towers, found chiefly in Ireland, where over 100 still exist. They are from 100 to 120 feet high, 16 feet diameter at base, and have walls 3 or 4 feet thick; built of more or less prepared stone. The building consisted of four stories, each reached by a ladder, and they were probably used as strongholds against the attacks of the Danes.

ROUP, is an infectious and usually fatal disease of the throat occurring amongst poultry kept with damp and insanitary surroundings. The hen mopes and presents an offensive discharge from the nostrils, and often has a grey membrane in the throat also. The diseased hens must be isolated, and if valuable, a veterinary surgeon consulted; if not, they are best killed and buried in quicklime, the hen house being thoroughly cleaned and, if possible, moved to fresh ground.

ROUSSEAU, JEAN JACQUES, *b.* 1712, *d.* 1778, the son of a watchmaker, was a native of Geneva. At the age of sixteen he began a wandering life, which lasted, with intervals of repose, till his death. As a writer he first became known by his "Discourse on Arts and Sciences," in which he maintained very plausibly that knowledge had not made mankind happier. His "Social Contract" helped largely to pave the way for the French Revolution, for his ideas as to the true basis on which a state should be founded permeated the minds of thoughtful Frenchmen. His autobiographical works reveal him as a selfish, unprincipled character, capable of sending his own children to a Foundling Asylum. There are few great writers, if any, for whom the world has so little respect.

ROWE, NICHOLAS, *b.* 1674, *d.* 1718, poet and dramatist, gained success with his "Ambitious Stepmother" when he was but twenty-four. Other tragedies followed, mostly successful, and his miscellaneous poems were welcomed. In 1714 he was made Poet Laureate. His works are not much read.

ROWLEY POEMS, THE, the poems which Chatterton professed to have found in manuscript, and which he published as the work of a priest named Rowley [See *Chatterton*].

ROWTON HEATH. Soon after his defeat at Naseby Charles entered Chester, then besieged by a Parliamentary army. Attempting to raise the siege, the Royalists were utterly defeated at Rowton Heath. This disaster, added to that at Philiphaugh (which see), deprived the king of his last hope.

ROWTON HOUSES, dwelling-houses for unmarried working men, who for 7d. a night, or 3s. 6d. a week, can obtain bed and use of public rooms. The first block, accommodating nearly 500 persons, was erected at Vauxhall, 1892, by Lord Rowton, formerly private secretary to Earl Beaconsfield. His expectations were more than realised, and now (1906) there are six blocks of these houses in different parts of London, all paying a fair interest on the capital laid out.

ROYAL ACADEMY OF MUSIC, Tenterden Street, Hanover Square, was founded in 1823 by Lord Burghersh. It received a royal charter in 1830, but had a chequered existence till 1868, when it was assured an annual grant of £500 from Government. All branches of music are taught, as well as the principal modern languages, and there are valuable scholarships.

ROYAL ACADEMY, THE. This institution, which now has its home in Burlington House, Piccadilly, was founded in 1768 under the patronage of George III., with Sir Joshua Reynolds as first President. It consists of 42 academicians (of whom two are engravers) and about 30 Associates. Besides holding an annual exhibition, it does important work in providing the best tuition,—gratis to necessitous students of talent—and in awarding valuable scholarships and exhibitions to enable students to continue their studies in painting, sculpture, or architecture.

ROYAL COLLEGE OF MUSIC, is the outcome and successor of the National Training School for Music. The latter was established in 1876, mainly to give free instruction to pupils of merit, selected by competition. Sir Arthur Sullivan was the first principal. In 1883 the Royal College was incorporated and received its charter, and in its home at Kensington Gore has done good work in conjunction with the Royal Academy in promoting and directing musical education.

ROYAL EXCHANGE, THE, a handsome building in the city of London, where merchants may meet and transact their business. The first building for the purpose was erected in 1570 by Sir Thomas Gresham, a flourishing and enlightened London merchant. It was opened by Queen Elizabeth. A second Exchange had to be built after the Great Fire, and it was opened in 1669. This, too, was burnt down, and in 1845 the present building was opened by Queen Victoria.

ROYAL FAMILY. Refer to *Index*.

ROYAL GEORGE, THE, a British warship which went down in 1782 in deep water off Portsmouth, with Admiral Kempenfeldt and a crew of 800 men. The vessel had been placed so as to get at the lower hull for repairs, when by the shifting of her guns she suddenly heeled over and went down. Cowper's beautiful poem, "Toll for the Brave," well expresses the emotion excited by the sad news.

ROYAL SOCIETY, THE, a society which aims at the advancement of scientific knowledge of all kinds, was incorporated by a Royal Charter granted by Charles II. in 1662. Most of its first members had been previously in the habit of meeting to discuss and read papers on scientific subjects. The history of the Society is almost the history of English Science, and a list of its members would include all the great scientists of the last 250 years. Nearly every week papers are read on the latest discoveries and developments in Science, and are collected and published yearly. Besides this, the Society makes grants to scientific investigators of all kinds, and awards medals to those who make striking or valuable discoveries. There are about 500 Fellows of the Society, and about fifteen are elected every year. Needless to say that the right to put F.R.S. after his name is one of a scientist's highest ambitions.

RUBBER. The trees and shrubs which produce some sort of rubber grow in a narrow belt round the world, within five degrees, north and south of the equator. There is a great disparity in the quality of rubber, the best being *Para* rubber, which comes from the *Hevea brasiliensis*, which grows in the Amazon valley. The great demand for rubber for the tyres of vehicles, and the increasing uses to which it is put by engineers, has recently led many companies, in Ceylon and elsewhere, to root up the old plantations of tea and coffee and to plant instead the famous Hevea or Para rubber tree. Planters in Ceylon, Borneo, the Malay Peninsula, and Java, are clearing off patches of jungle and planting Hevea. The present (1906) total output of the Eastern plantations is only 200 tons per annum, whereas Brazil exports 30,000 tons. Very large quantities of inferior rubber come from the Congo and Liberia, Peru and Bolivia. The great rubber ports in Brazil are Manaos and Para.

RUBENS, PETER PAUL, the great Flemish painter, *b.* 1577, *d.* 1640, was born in Germany, the temporary home of his parents. In 1609 he settled in Antwerp, his mother's native city, and there, five years later, produced his masterpiece, the "Descent from the Cross." He visited France, Spain and England, practising his art, and acting as diplomatic agent on behalf of his country, for he was a skilful politician and an excellent linguist. His finest works are to be seen in Antwerp, but London, Paris, and Munich contain many excellent specimens.

RUBICON, a little river of central Italy, near Rimini, which in Cæsar's time formed the boundary between the Roman Republic

and its dependent state, Cisalpine Gaul. If Cæsar crossed this with an army without a special decree enabling him to do so, he would be making war on his country. Hence "to cross the Rubicon" is a metaphorical expression for taking an irrevocable step.

RUBINSTEIN, ANTON, *b.* 1829, *d.* 1894, pianist and musical composer, of Jewish race, was born in Roumania. At the age of eleven he performed before the public at Moscow, and at twelve in Paris. The great Liszt recognised his genius, and encouraged him. He made his home in St. Petersburg, but his time was largely occupied in concert tours, which were immensely successful. He wrote numerous operas, besides his oratorios, "Moses" and "Christus," but he will best be remembered for his songs and chamber music, in which two species of composition he has few equals.

RUBRICS, in law books, are the titles or headings of chapters or of statutes. In ecclesiastical use they are the directions and rules given in the Liturgy for the conduct of the service. The name arises from these parts being formerly printed in *red* (L. *rubricus*).

RUBY, a gem prized next to the diamond and in many cases above it. It is a species of alumina, as are the sapphire, emerald, and amethyst, and has a specific gravity of about 3·9. Only the diamond exceeds it in hardness. A perfect ruby is not so common as a perfect diamond of the same size. Its value per carat increases with its size, so that where a 5 carat ruby may be worth £100 per carat, one of 20 carats would probably be worth £500 per carat. Burma is now the chief source of natural rubies, but artificial ones of great merit are produced chemically.

RUGBY SCHOOL, one of the four greatest public schools of England, only Eton, Winchester and Harrow rivalling it in importance and antiquity, has accommodation for about 400 pupils. Founded in 1567 by Laurence Sheriff, it did good work locally for a long time, but Dr. Arnold, who became Head Master in 1828, made its reputation national. "Tom Brown's Schooldays," by Judge Hughes, gives a vivid picture of life at Rugby School.

RULE BRITANNIA. This stirring national song is one of the lyrics from a masque written by Thomson and Mallet in 1740 for Frederick, Prince of Wales. Which of the two actually wrote the words we do not know; the music is by Dr. Arne, the composer of so many favourite songs.

RUM, a liquor obtained by distillation from the "scum" that arises when cane-juice is boiled to obtain sugar, and from molasses. Jamaica and Demerara are our chief sources of supply, but the consumption has gone down from nearly nine million gallons in 1875 to about half that quantity.

RUMINANTS, a group of animals distinguished from all other animals by the fact that they "chew the cud," or in other words, that their food is brought back from the stomach to the mouth to be masticated. Camels, deer, giraffes, oxen, sheep, goats, and antelopes are the chief ruminants. The stomach is divided into four compartments, of which the first is practically a place of storage; the second forms the food into the required shape and consistency to pass back up the gullet; and the third and fourth complete the process of digestion when it returns.

RUMP PARLIAMENT. On December 6th, 1648, Cromwell, who had been alarmed by the willingness of the Long Parliament to treat with Charles, sent Colonel Pride with an armed force to prevent all members but those who were devoted to the army from entering the House of Commons. By the remnant who were allowed to enter, together with the army, the trial and execution of the king were authorised. The members who thus continued to sit were called the "Rump" Parliament. They were expelled by Cromwell in 1653, but assembled again in 1659 to take measures which resulted in the Restoration.

RUNCORN, a market town and seaport of Cheshire, stands near the head of the Mersey estuary, on the south side. It dates from Saxon times, but rose to importance in 1772, when it became the terminus of the Bridgewater Canal. Its dock accommodation has been increased since the Manchester Canal was finished. Shipbuilding and the manufacture of chemicals are carried on. The railway bridge over the Mersey is a fine work; population about 20,000.

RUNES, the characters or letters of the alphabet used by the ancient German and Scandinavian tribes in the early centuries of our era. The origin of the letters is not clear, but probably they were learnt from the early Phœnician traders, and modified to suit the sounds they were required to symbolise. Inscriptions traced in Runic characters are also often called "runes." They are commonly found in Scandinavia, and a few have been discovered in England.

RUNNYMEDE, a meadow on the right bank of the Thames, between Staines and Windsor. Here the army of the barons assembled in June, 1215, while John and his attendants were encamped on the island opposite. On the 15th of the month John signed the document called "Magna Charta," still preserved in the British Museum.

RUPEE, a silver coin current in India, and in some other of our eastern possessions. Its nominal value is two shillings, but owing to the depreciation of silver, its value is fixed by the Indian Government at 1s. 4d., or 15 rupees to the £.

RUPERT, PRINCE, *b.* 1619, *d.* 1682, was the son of Elizabeth, daughter of James I., who married Frederick, the Elector Palatine of the Rhine. Rupert was present when his uncle, Charles I., raised the royal standard at Nottingham in 1642, and he took an active part in the Civil War. Had his caution equalled his daring, it is possible that the war might not have ended quite as it did, for he would win a battle by a dashing charge and then lose it by a heedless pursuit of the flying enemy. After the Restoration, he did good service in the Dutch wars, and also took great interest in scientific investigations.

RURAL DEAN. Refer to "Church Dignitaries" in *Index*.

RUSKIN, JOHN, *b.* in London, 1819, *d.* 1900, the great art teacher, social reformer, and writer of the 19th century, was the son of a wealthy wine merchant, who had his boy educated at home until the time came for him to go to Oxford. Long before this he had dabbled in authorship, and his work, though having no permanent value, gave undoubted signs of genius. His mission in art was to teach the true nature of beauty, and to aid people in appreciating it aright. To this end his "Modern Painters," "Seven Lamps," and "Stones of Venice" were directed. Later in life he lectured and wrote on education, morals, and social topics generally. "Ethics of the Dust," "The Crown of Wild Olive," and "Fors Clavigera" mark this period. He spent his last years in retirement at Coniston, where he was buried.

RUSSELL, (JOHN), EARL, *b.* 1792, *d.* 1878, politician, statesman, and writer, commonly known as "Lord John Russell," till his elevation to the peerage. Trained for politics, he entered Parliament young, and soon made his mark, being found always on the side of progress. He advocated the repeal of the Test and Corporation Acts, and had a great hand in the Reform Act of 1832. He has a large share of the credit of conciliating the Canadians by the settlement of 1841. He was Prime Minister in 1846 and in 1866, and indeed took a leading part in all Liberal administrations up to the latter year. His literary works are chiefly biographical and historical. His peerage was bestowed in 1861.

RUSSELL, LORD WILLIAM. See *Rye House Plot*.

RUSSELL OF KILLOWEN, LORD, *b.* at Newry, Ireland, 1832, *d.* 1900; Lord Chief-justice of England. He was noted for his physical and mental vigour, which made itself keenly felt in cross-examination. He gained a great reputation as counsel for Parnell, 1889. He was counsel for Britain in the Behring Sea Fisheries Arbitration, 1892; succeeded Lord Coleridge as chief-justice in 1894; conducted the trial of the Jameson raiders, 1896; and was one of the arbitrators in settling the boundary of Venezuela, 1899.

RUSSELL, SIR WILLIAM HOWARD, the first great "war correspondent," was born in Ireland, 1821, and educated at Trinity College, Dublin. He went out to the Crimea as correspondent for the *Times*, and thence wrote those famous letters which revealed to England the painful condition of our soldiers there, owing to stupid mismanagement. His correspondence in the Crimean War and the Indian Mutiny has been published in book form: "Letters from the Crimea," "My Diary in India," etc.

RUSSIA, a country hardly reckoned to be of European importance in the 18th century, began to show her strength and resources at the opening of the 19th, and bids fair to engage a large share of the world's attention in the 20th. In Europe she rules 2,000,000 square miles, or about half the total area, and in Asia 6,000,000 more, so that the Russian Empire nearly equals the British in size. A good deal of the northern part of Russia is uninhabitable from the intense cold, and in the more southern parts the climate is very extreme, the summer being very hot, and the winter cold to a degree hardly realisable by Englishmen. Agriculture is the chief industry, and the exports of grain, timber, tallow, hemp, hides, skins, oil, flax, wool and leather are considerable. The petroleum wells in the Caspian districts are of considerable importance. The Russian Government has tried by prohibitive tariffs to encourage native manufactures, but their growth is not rapid. The reign of Peter the Great (1696-1725), marks the commencement of modern Russia. He built St. Petersburg, organised the army, founded a navy, introduced improved methods of agriculture, and gave an impetus to education. But none of these reforms touched the serfs, and until Alexander II. freed them in 1861, they were practically slaves. The persistent persecution of all who differ from the "orthodox Church" is a serious blot on the religious and civil administration of the country. St. Petersburg, the capital, on the Neva, has a population of 1,260,000. Moscow, the ancient capital, contains the Kremlin, a group of imperial and ecclesiastical buildings; population 1,000,000. Odessa, population 400,000, near the mouth of the Dnieper, is the great grain port of the Black Sea; Astrakhan, population 113,000, at the mouth of the Volga, trades

largely with Asia; Baku, also on the Caspian, is the head of the petroleum industry.

RUSSO-JAPANESE WAR. See *War, Russo-Japanese.*

RUSSO-TURKISH WAR. In 1877 Russia took up arms on behalf of the ill-treated Christians in Turkey. The Turks offered a much stouter resistance than had been anticipated, but after the Russians, aided by the Roumanians, took Plevna, their resistance crumbled. The Treaty of San Stefano, which marked the conclusion of the war, was greatly modified at the Berlin Congress, held soon afterwards, 1878.

RUST, a compound of oxygen and iron that only forms in presence of water. Iron that is exposed to the atmosphere is usually coated with paint, which requires to be renewed from time to time. Thin iron articles are covered with zinc (galvanized) or tin to preserve them from rust. Japanning is an effectual but more expensive way of preserving iron. Warships have four or five coats of special paint to preserve their armour, but even then rust has been known to be produced underneath.

RÜTLI, a meadow above the southern branch of Lake Lucerne, in Switzerland. Here, in 1307, the men of the Swiss cantons —Uri, Schwitz, and Unterwalden —met in conference and organised the rising that overthrew the Austrian power in Switzerland.

RUYSDAEL, JACOB, a great Dutch landscape painter of the 17th century. He lived and worked at Haarlem, and most of his subjects were taken from the neighbourhood. The gloomy and majestic was the aspect of nature he delighted to portray.

RUYTER, ADMIRAL, a great Dutch sailor who rose from the lowest ranks, is chiefly interesting to us from the trouble he gave us in the time of the Commonwealth, and under Charles II. In the former period, he and De Witt fought for naval supremacy with Blake and Monk; while in 1677 he actually sailed up the Thames and Medway, and burnt some ships at Chatham.

RYE, an interesting old town of Sussex, nine miles east of Hastings. It is one of the old "Cinque Ports," but is now two miles from the sea; population 4000.

RYE, a cereal allied to wheat and barley, much cultivated in Northern Europe, where wheat will not ripen. Bread made of it is much darker than wheaten bread, and not quite so nutritious. Rye is mostly grown in England to be cut down as a green food for sheep, cattle, and horses.

RYE HOUSE PLOT, a plot made in March, 1683, to assassinate the king, Charles II., as he returned from Newmarket to London. The few desperadoes who formed the plot were also connected with a much more extensive scheme for raising a general rebellion against the government, and both plots being discovered, Charles managed to involve the heads of the latter scheme in the odium of his attempted assassination. Thus at one blow he got rid of the chief Whig leaders, including Lord William Russell and Algernon Sidney.

RYMER, THOMAS, a 17th century writer and critic, is chiefly remembered for his invaluable collection of historical materials, whether letters, treatises, acts, or proclamations, dealing with the 12th and succeeding centuries, to his own time.

RYSWICK, a Dutch village near the Hague. Here was signed, in 1697, the treaty which brought peace between France on the one side and England with her continental allies on the other. It was a veritable triumph for William III., although he had gained no brilliant successes in arms.

SAARBRÜCK, a town of Rhenish Prussia, with important manufactures in iron, glass and chemicals. It was the scene of the first encounter in the Franco-German War of 1870-1.

SABBATH, a Hebrew word meaning *rest*, the name of the seventh day in the week, which was set aside, from the earliest times, as a day of rest. The fourth of the commandments committed to Moses on Sinai directed the observance of the seventh day as a Sabbath, and after the Captivity the day was observed with great strictness. The early Christians transferred their Sabbath to the Sunday or first day of the week; but the Jews still observe Saturday or the seventh day of the week as the Sabbath.

SABLE, a kind of marten, a native of Siberia, trapped in pits to prevent injury to the fur. It is about 20 inches long, and has a brown fur, yellowish on the throat. The skin is of great value, a perfect one fetching nearly £30.

SABOTS, wooden shoes worn in the Netherlands and the north of France. They are made of blocks of soft, tough wood, usually alder, beech or fir, and the industry is carried on principally in the Cevennes. A padding of wool or packing of straw is used to make the shoes fit.

SACCHARIN, an intensely sweet, white, crystalline product of coal-tar, useful as a substitute for sugar. At present it is used for diabetic patients, and in disguising the taste of drugs, but its cost and the uncertainty of its effects have so far prevented it from usurping the place of sugar.

SACHEVERELL, HENRY, *b.* 1672, *d.* 1724, an ardent High Church preacher of great popularity in the reign of Queen Anne. He was impeached by the Whigs before the House of Lords, for his pulpit attacks upon the Act of Toleration, and forbidden to preach for three years. The succeeding Tory government invited him to preach before them.

SACHS, HANS, *b.* 1494, *d.* 1576, a German poet of a singularly happy disposition, who worked as a shoemaker at Nuremberg.

SACK was a general name for the white, dry wines that came from Spain and the south, as distinguished from the red wines of Portugal and France. Canary was the commonest of sacks. The popularity of the wine is illustrated by the fact that Shakespeare made it the favourite drink of Falstaff.

SACRAMENT. The Latin word originally denoted the *oath* taken by a Roman soldier on entering the army. It was adopted by the early Christians as the name for the most sacred rites of the Church. The Protestant Churches restrict the term to the two ordinances "ordained by Christ Himself," viz., "Baptism and the Supper of the Lord." In the Roman Catholic Church the term is applied to seven ordinances:—Baptism, Confirmation, the Mass, Penance, Extreme Unction, Holy Orders and Matrimony.

SACRIFICE, a form of religious observance almost universal amongst ancient nations and peoples, both civilised and barbarian. It took two forms: (1) gifts or oblations as thank-offerings, consisting of fruits, oil, wine, grain or flesh, which were partly consumed by the worshippers and partly poured out on the ground or burned for the object of worship to partake of; (2) living victims, slain as a propitiatory sacrifice, to appease the anger of the Deity, or to avert the wrath of some god whom the worshippers feared. Ordinarily the sacrifice was a feast in which gods and worshippers shared.

SACRILEGE, a term denoting the act of breaking into and stealing from a place of worship. The offence of sacrilege comes under the description of house-breaking, and has no longer a separate legal signification.

SADDUCEES, an aristocratic party among the Jews at the time of our Lord. They rejected the traditional teaching of the Scribes and recognised only the written law. They denied the doctrine of the resurrection, and did not believe in the existence of angels or spirits. They were probably highly cultured, but worldly and somewhat cynical.

SADOWA, a village near the city of Königgratz, in Bohemia. It gave its name to a battle fought in 1866, when the Prussians signally defeated the Austrians.

SAFES, or strong boxes for the protection of papers and valuables from fire and burglary, were first brought to a state of satisfactory security by Mr. Thomas Milner in 1840. They are built of double plates, and the interspace is filled with fire-resisting chemicals, such as alum. The outer wall or plate is threefold, and the door has a series of locks set in dovetail directions on each of the four edges. Safe-deposits are large chambers containing safes, specially built and guarded with a view to perfect security. The Chancery Lane Safe Deposit is open to inspection daily.

SAFETY-LAMP, an oil lamp for use in coal mines, with a chimney made of fine gauze, which fits so closely as to leave no aperture greater than the mesh of the gauze. Its purpose is two-fold; it shows by a change in the colour and size of the flame the presence of firedamp, and it enables the flame to exist in this explosive atmosphere without communicating the effects to the air outside the gauze. Sir Humphry Davy announced his invention of the first safety-lamp in 1815, and although electric light has now become common in mines, the safety-lamp is still used as a means of detecting the presence of explosive gases.

SAFETY-VALVE, an arrangement by which the pressure of steam within a boiler may be relieved after it has reached a certain degree of intensity. The valve is kept closed by a spring or by weights, which are only movable by a high pressure of steam. In this way the pressure effects the opening of the valve when otherwise it might have injured or burst the boiler plates.

SAFFRON, a colouring matter obtained from the dried stigmas of a species of crocus. Many flowers are necessary to yield a small quantity of saffron, and its uses as a dyeing agent is declining. It has medicinal values, and is esteemed as a condiment as well as a safe colouring matter for foods and confectionery.

SAGAS, Icelandic tales partly historical and biographical and partly fabulous, but giving a vivid idea of the manners and life of the days in which they were written. The first writer of sagas lived in the 11th century, and his work deals with Iceland and the early Norwegian kings. The *Edda*, an account of Scandinavian mythology, was written about 1200 A.D.

SAGHALIEN ISLAND, an island in the Sea of Okhotsh, separated from Siberia by the Gulf of Tartary, and from Yezo, Japan, by La Perouse Strait. It stretches for 550 miles from north to south with a breadth varying from 15 to 80 miles. It has extensive forests of valuable timber, frequented by numerous fur-bearing animals, but its most important product is coal. In 1875 it was ceded by Japan to Russia by whom it has been used as

a convict station. As a result of the Russo-Japanese War, 1904–5, the island is divided between the two Powers, the southern half now belonging to Japan.

SAGO, a food-stuff obtained from the pith of various palm trees in the Eastern Archipelago, and particularly in Sumatra and Borneo. The tree is cut, and the pith extracted from sections of the stem and placed in a sieve, through which water is passed. This carries the flour into a second vessel, where it is deposited and dried after the water has been run off. The sago is then sent to Singapore, where it is prepared for the market, and shipped.

SAHARA, THE, is the great belt of desert that stretches eastwards from the Atlantic to the Nile, and southwards to the Niger and Lake Chad. Its northern edge is the hinterland of Morocco, Algeria, Tunis and Tripoli. South of Algeria and Morocco and in the centre are important mountain ranges seamed with valleys in which water is to be found below the surface. The mountains of the central plateau are covered with snow for three months of the year. The Sahara is crossed by many caravan routes, which follow the oases. The routes from Murzuk in Tripoli to Lake Chad, and from Morocco to Cairo are of particular importance. A process of desiccation or drying is in progress all over this area. Extreme heat during the day and excessive cold during the night, combined with the great evaporation that takes place, tend to break up the rock and thus to produce fragments that the wind reduces to sand. It is a wide error to suppose that the Sahara lies as a whole below the sea level, although a chain of lagoons exists in Northern Algeria, which have been surveyed with a view to forming them into an inland sea by connecting them with the Mediterranean.

SAHIB (Arab. "Master") a term of respect equivalent to Mr. or Sir, used by natives in India and Persia in addressing Europeans.

SAIGON, the capital of French Cochin-China, is a handsome modern city 60 miles from the sea, on the delta of the Mekong. It is the centre of French influence in Siam and the East.

SAINT. For names of saints, see under the proper name, as *Augustine, Saint.*

ST. ALBANS, a cathedral city of Hertfordshire, 20 miles north of London. It was the important Roman station of Verulam, and remains of the original British and Roman works still exist. The Abbey is an interesting Norman building of great length, and containing a remarkable number of Roman tiles in its structure. The abbots of St. Albans were of great importance in the Middle Ages, and the shrine of the martyr attracted pilgrims and offerings to the church.

ST. ANDREWS, an ancient Scottish city and university town on the coast of Fife, 40 miles north of Edinburgh. There are about 200 students at the University, and many ladies take the St. Andrews degree of L.L.A. (Lady-literate in Arts). The golf links are famous as the home and headquarters of the game; population 7,000.

ST. ALDWYN, LORD. *See Hicks Beach, Sir Michael.*

SAINT-ARNAUD, MARSHAL, *b.* at Bordeaux, 1796. *d.* 1854, made his name as a soldier in Algeria, and assisted Louis Napoleon in the *coup d'état* by which he became Napoleon III. in 1852. He led the French troops in the Crimea, at the battle of the Alma, in 1854, and died on his way home.

ST. ASAPH, a small cathedral city of Flintshire of 2,000 inhabitants, with the smallest cathedral in Great Britain. It is built of red sandstone in the Decorated style and is of simple cruciform plan. There is a small Elizabethan Grammar School, which was rebuilt in 1882.

ST. BARTHOLOMEW'S DAY, August 24th, was rendered memorable in 1572 by a concerted massacre of Huguenots throughout France, by the garrisons of all the cities where the population was of mixed faith. "A white sleeve and the white cross of Lorraine were the tokens by which the murderers were to know one another" (Miss Yonge). The massacre was the outcome of the attempt of the queen-mother, Catherine de Medici, to play off the Huguenots against the powerful Romanist faction of the Guises, who in their turn, inflamed their followers by insinuations of Huguenot plots.

ST. BERNARD DOG, THE, takes its name from the hospice at the head of the Great St. Bernard Pass from Switzerland to Italy. The present St. Bernard is of the Newfoundland breed crossed with a short-haired breed, the shaggy coat of a pure Newfoundland being unfitted for work in the snow. They accompany the monks as far as the shelters on either side of the Pass to assist travellers whom the monastery has been warned to expect, by telephone from the valley.

ST. BERNARD, THE GREAT, a pass 8,120 feet high, between Martigny in the Rhone Valley in Switzerland and Aosta in Piedmont. The famous hospice at the top of the pass is kept by a dozen sturdy Augustinian monks, as a means of assisting and sheltering travellers.

SAINTE BEUVE, *b.* 1804, *d.* 1869, a great French literary critic. His best work appeared weekly, in the form of critical articles entitled "Causeries du Lundi," in the *Constitutionnel* and other papers. Each "Causerie" represented some sixty hours' work, and they form as a whole an inexhaustible mine of facts and ideas bearing on human character and literary art.

ST. CLOUD, a town 10 miles west of Paris, situated on rising ground above the Seine. A château built here by the Duke of Orleans, brother of Louis XIV., was a favourite residence of the two Napoleons. The celebrated Sèvres-ware factory stands within its grounds.

ST. DAVIDS, an ancient cathedral city of Pembrokeshire, with a population of 2,000. It stands on the extreme western point of the county, and is of great interest to students of antiquity.

ST. DENIS, a city 3 miles north of Paris. Its abbey church contains the tombs of the French kings.

ST. ELIAS, MOUNT, a snow-clad, volcanic mountain, 18,000 feet high, standing near the Pacific coast on the Canadian side of the frontier of Alaska.

ST. ELMO'S FIRE, an electrical phenomenon similar to the brush discharge from an electrical machine. It is caused by the electricity from a cloud, at a low level, combining with that of the earth, and playing about the extremities of pointed objects appears as luminous brushes. It is rarely seen in Britain.

ST. ÉTIENNE, a town of 140,000 inhabitants, standing on a tributary of the Loire, about 36 miles south-west of Lyons. It is the centre of an important coal-field, and has a great iron and steel industry. Ribbons and lace are extensively made by people working in their own houses. The town is grimy and uninteresting, but it is the most important ironworking centre in France.

ST. GOTHARD, a mountain pass in Switzerland, from whose glaciers descend the rivers Rhone, Rhine, Ticino and Reuss. The St. Gothard Pass crosses a shoulder of the mountain at a height of 7,000 feet, from Lucerne to the Ticino valley and the Italian Lakes. The railway passes through the St. Gothard Tunnel (9¼ miles) at a height of 3,600 feet, and forms one of the chief means of communication between Italy and Germany. It was completed in eight years, and opened in 1882.

ST HELENA, a lonely island, 1,200 miles west of the African coast, and a port of call on the way to the Cape. Its capital, Jamestown, is a coaling station for the navy and is strongly fortified. Here Napoleon was obliged to live, 1815–21, and here General Cronje and 2,000 Boer prisoners of war were kept 1900–2; population over 3,000.

ST. HELENS, a Lancashire town between Liverpool and Wigan, and twelve miles from the former. Railway and canal facilities and the presence of coal have led to its development within living memory from a village to a great centre of industry. It specializes in sheet and plate glass, and has important alkali and iron works. (For population, etc., see p. 902.)

ST. JAMES'S PALACE, originally a hospital dedicated to Saint James, was adopted as a royal residence by Henry VIII., who built the clock tower and gateway from designs by Holbein. Charles I. slept at St. James's the night before his execution, and walked across St. James's Park to Whitehall next morning. The British Court is officially known as the "Court of St. James's," though the palace is no longer used as a residence of the sovereign.

ST. JOHN, (1) the largest river of New Brunswick, for a great part of its course separates that State from Maine. It flows into the Bay of Fundy after a course of 450 miles. (2) The largest town of New Brunswick stands on the north bank of the estuary of St. John River. It forms an excellent winter port for the Dominion, and is connected with Montreal by the Inter-colonial Railway; population 40,000.

ST. JOHN, HENRY, created Viscount Bolingbroke. *b.* at Battersea, 1678, *d.* 1751, an English statesman, who took an important share in the government in Queen Anne's reign. Being opposed to the House of Hanover, he fled, at Anne's death, to France, but subsequently returned and wrote on political subjects, including a "Dissertation on Parties" and the "Idea of a Patriot King."

SAINT-JUST, ANTOINE, *b.* 1767, *d.* 1794, an ardent French revolutionist, who perished on the scaffold along with his leader, Robespierre. His early work for his party lay with the armies on the North-eastern frontier, where his zeal and fiery enthusiasm were of great value. He was singularly beautiful and youthful in appearance, but utterly relentless in carrying out his purposes.

ST. LAWRENCE, THE, is the general name applied not only to the great river that issues from the great lakes of North America, but to the water-way through them. It rises with the Mississippi and the Red River, on the plateau of Minnesota, under the name of the *St. Louis*, and passes into Lake Superior. Under the name of St. Mary's river it passes to Lake Huron, which is connected by a wide water-way with Lake Michigan, the most southerly of the lakes. Thence by the river and lake of St. Clair and the Detroit river it reaches Lake Erie, and leaves that lake to pass over the great Niagara Falls on its way to Lake Ontario, the last of these inland seas. Before it reaches the island city of Montreal it becomes entirely Canadian, and after it passes Quebec it begins to widen out into the Gulf of St. Lawrence. Eight important canals have been constructed to obviate the obstacles of falls and rapids, and of these the Welland Canal, which avoids the Falls of Niagara, is the most

famous. Of the tributary rivers, the Ottawa, which joins the main stream opposite to Montreal, is the most important.

ST. LAWRENCE, GULF OF, the estuary of the St. Lawrence River is sheltered from the Atlantic by Newfoundland and Cape Breton Island. It also contains Anticosti and Prince Edward's Islands, and many clusters of islets which render navigation difficult during the fogs that often prevail. The Gulf is impeded by ice from December to March, and Halifax in Nova Scotia is used during that period as a winter port for the Dominion.

ST. LEGER, a famous annual horse-race, founded in 1776, and named after Colonel St. Leger. It is run on Doncaster racecourse about the beginning of September.

ST. LOUIS, U.S.A., the principal city of the Mississippi valley, stands on the right bank of the river, 20 miles below the junction of the Mississippi and Missouri. It extends along the river for a frontage of 19 miles, and the river is crossed by two magnificent bridges of over 800 yards in length. It has a great grain and cotton trade, and is the leading tobacco centre in the world. Population exceeds 600,000. The year 1904 was rendered memorable in the history of St. Louis by the great World's Fair, held here during the spring and summer.

ST. LUCIA, the largest of the Windward Group of the Lesser Antilles. It contains scenery of exceptional beauty, and produces sugar, cocoa, tobacco, and spices. Castries, the capital, possesses one of the finest harbours in the West Indies, and serves as the principal coaling station of the British West Indian fleet.

ST. MALO, a strongly fortified French seaport built on a rocky islet communicating with the mainland by a causeway, at the mouth of the River Rance, Brittany.

ST. MARK'S, VENICE, originally the ducal chapel, now the cathedral of Venice, was erected 976–1071. The interior is decorated with wall pictures executed in mosaic on a background of gold. Over the main entrance are the four gilded bronze horses brought from Constantinople in 1204, removed to Paris by Napoleon, and restored to Venice in 1815. Its celebrated campanile (bell-tower), 323 feet high, collapsed in 1902.

ST. MICHAEL'S, the largest of the Azores, is about 40 miles in length, with a breadth varying from 5 to 10 miles. The island is of volcanic origin, exceedingly fertile, and produces the finest oranges in the world. The exports also include lemons and other fruits, wine, wheat, and maize.

ST. MICHAEL'S MOUNT, a conical mass of granite rising to a height of 250 feet, in the north-east corner of Mount's Bay, Cornwall. On the opposite side of the English Channel stands Mont St. Michel, in Brittany.

ST. PAUL, on the Mississippi, 2,070 miles from its mouth, is the capital of Minnesota, U.S.A. It is an important railway centre, and carries on an extensive distributing trade. In August, 1904, the city was visited by a destructive hurricane; population exceeds 150,000.

ST. PAUL'S CATHEDRAL stands at the summit of Ludgate Hill, London. The present building was erected 1675–1710, by Sir Christopher Wren, on the site of the old cathedral which had been restored by Inigo Jones, but which was destroyed in the Great Fire of 1666. The cost was defrayed by levying a tax on coal. The most conspicuous feature is the immense dome, surmounted by a lantern with ball and cross, the latter 364 feet above the ground. Among its "mighty dead," Nelson and Wellington are interred close together under the centre of the dome.

ST. PETER'S at Rome is considered the finest cathedral in the world. It stands on the legendary site of the martyrdom of the Apostle and of many of the early Christians of Rome. The present building, which is the successor of the basilica erected by Constantine the Great in 306, was begun in 1450 and completed in 1626. The dome, which is 44 feet higher than that of St. Paul's, was the work of Michael Angelo. The cathedral is of immense size, but the details of the interior are so perfectly proportioned that this is not at once apparent.

ST. PETERSBURG, the capital of Russia, on the Neva, was founded by Peter the Great, in 1703. The site is low and marshy and surrounded by dreary wastes, and the poor parts of the city are liable to periodic inundations of the Neva. Its palaces and government buildings are among the largest in the world. It is the principal manufacturing centre of Russia, and is the commercial capital and chief port, taking more than half the foreign trade of the country. The principal exports are corn, flax, linseed, leather, and petroleum; population exceeds 1¼ millions.

SAINTSBURY, GEORGE EDWARD, *b.* 1845, is one of the leading literary critics of the day. His industry is extraordinary, and his work is marked by great knowledge and clear thought. He has written extensively on French and English literature, and was for some time editor of Macmillan's Magazine. He is professor of English Literature at Edinburgh University, and is engaged (1906) on his *magnum opus*, "A History of Criticism."

ST. VINCENT, CAPE, a lofty, rocky headland in the south-west of Portugal. Off this cape Admiral Jervis defeated a Spanish fleet, 1797. He was created Earl of St. Vincent.

ST. VINCENT, EARL OF. See *Jervis.*

SAKHALIN. See *Saghalien.*

SALAAM, from an Arabic word meaning "peace," is the form of salutation used by Mohammedans among themselves. Saying "Peace be with you," the Mohammedan places his hand on the head and inclines his body forward, receiving usually as response "With you be peace."

SALADIN, *b.* 1137, *d.* 1193, by his military skill and daring made himself sultan of Egypt and Syria. He attempted to expel the Christians from Palestine, gaining a great victory over them on the Plain of Tiberias, in 1187, and later in the same year taking Jerusalem. These events led to the Third Crusade, in which Richard Cœur-de-Lion recovered Acre and defeated Saladin in two important battles. In 1192 a truce was concluded between the two leaders, which left the Christians in possession of the strip of coast between Jaffa and Tyre, while the rest of Palestine remained in the hands of Saladin.

SALAMANCA, a Spanish city, about 120 miles north-west of Madrid. Its university is one of the oldest in Europe, and at one time attracted 14,000 students from all parts of the continent. In the neighbourhood Wellington gained a great victory over the French, 1812.

SALAMANDER, a species of animal akin to the frog and the newt and similar in shape to a lizard. It is chiefly interesting from the ancient belief that it could live quite comfortably in fire.

SALAMIS, a mountainous island of Greece, about 10 miles west of Athens. In the narrow strait between it and the mainland was fought the famous battle in which the Greeks, under Themistocles, defeated the Persians under King Xerxes, 480 B.C., and secured their independence.

SALFORD, a parliamentary borough of Lancashire, now practically a suburb of Manchester. It manufactures cotton and iron. (For population, etc., see p. 902.)

SALIC LAW, the law that excluded women from the throne of France. It seems to have been derived from the code of the Sabian Franks, among whom women were debarred from inheriting certain lands known as *Salic lands.* One of its first applications to the crown was when it was brought forward in opposition to the claim of Edward III. of England to the throne of France. The law remained in force from that time to the close of the French monarchy.

SALISBURY, formerly called New Sarum, the capital of Wiltshire, is famous for its cathedral, begun in 1220 and completed in 1258; population about 17,000. See *Old Sarum.*

SALISBURY, MARQUIS OF (Third), *b.* at Hatfield, 1830, *d.* 1903, a celebrated English statesman and Secretary for Foreign Affairs. In early life he worked hard as a journalist, and was a regular contributor to the Saturday and Quarterly Reviews. In 1868, through the death of his father and brother, he succeeded to the marquisate, and was at once recognised as one of the greatest debaters in the House of Lords. In 1874 he was again Secretary for India, this time under Disraeli, and in 1881 he became Secretary for Foreign Affairs. He was one of the representatives of this country at the Berlin conference of 1878. On the death of Lord Beaconsfield, in 1881, he became leader of the Conservative party. After that date he four times occupied the position of prime minister, on the two last occasions forming a coalition with the Liberal Unionists. He retired from public life in July, 1902. His chief relaxation from the cares of State was the study of chemistry and electricity.

SALISBURY PLAIN, an elevated plain in Wiltshire, near Salisbury, now used as a military camp. It is famous for the remains of the Druidical temple of Stonehenge.

SALLEE, an Atlantic seaport of Morocco which, as the home of pirates, gave its name to the famous *Sallee Rovers* immortalized in "Robinson Crusoe."

SALLUST (Caius Sallustius Crispus) a Roman historian, *b.* 86 B.C., *d.* 34 B.C. He belonged to the political party of Cæsar, whose fortunes he followed. He amassed great wealth and laid out the famous Quirinal gardens. As an historian he followed the brief and concise style of the Greek historian Thucydides. His chief works are "Catalina" and "Jugurtha."

SALMON inhabit both fresh and salt water. In autumn the adult fish ascend the river from the sea for the purpose of spawning. The spawn is deposited during the months of October, November, and December, in shallow grooves hollowed out in the gravel in the river bed by the tail of the female fish. Rivers continue to be the home of the fish until the spring floods, when they return to the sea. On both the ascending and descending journey they remain for some days in the brackish waters of the estuaries, and so gradually accustom themselves to the change of habitat. The young fish are hatched out in April or May. At first they are weak and timid, and confine themselves to the immediate neighbourhood of their birth-place, sheltering under stones and rocks in the quieter parts of the stream. In the *parr* stage, which is attained in about twelve months, their bodies are marked by dark transverse

bands. At the age of about two years they become *smolts*, when the dark bands are exchanged for a covering of bright, silvery scales, and the fish are able to pay their first visit to salt water. At this stage they average from 6 to 8 inches in length. A stay of from two to six months in the sea adds considerably to their weight, and they return to the river as *grilse* or *salmon peel*, weighing from 3 to 10 pounds. At this stage the fish are first capable of depositing eggs. The salmon is extremely prolific. It has been estimated that more than 150 millions of salmon ova are annually deposited in the Tay alone. Of these, only about one-third reach the parr stage, and probably less than one in fifty of these becomes a perfect fish.

SALONICA, the ancient Thessalonica, is the chief port of Macedonia, and stands at the head of the Gulf of Salonica which forms the north-west corner of the Ægean Sea. Its ancient importance was due to its position as a port upon the great Roman road to Byzantium (Constantinople). It has many interesting Greek, Roman, and Byzantine remains, but since the great fire of 1890 the business part of the city has been modernized. The chief exports are grain, wool, skins and tobacco.

SALON, THE, galleries in Paris in which an exhibition of pictures recently painted is held annually.

SALOP, same as Shropshire.

SALT. (1) Common salt is a compound of sodium and chlorine. It is widely diffused throughout the world. Sea-water contains nearly 3 per cent. by weight, and the waters of certain salt lakes and brine springs are even more fully impregnated. In the form of rock-salt it is found in great abundance in Cheshire and Worcestershire, and in various parts of the continent of Europe, notably so in the north-east of Austria, where the galleries in the mines at Wieliczka, near Cracow, exceed 50 miles in length. Its uses as a preservative, as a condiment, and in cooking are well known. It is extensively employed in alkali works in the manufacture of soda-ash or carbonate of soda. (2) In the science of chemistry the term salt is applied to any compound substance formed by the union of an acid with a metal or base.

SALT LAKE CITY, the capital of Utah, U.S.A., and the head-quarters of Mormonism. The city, which stands at the foot of the Wasatch Mountains, more than 4,000 feet above sea-level, was founded by Brigham Young in 1847, and contains the Mormon temple and the university of Deseret.

SALT, SIR TITUS, *b.* near Leeds, 1803, *d.* 1876, a manufacturer and philanthropist. Near his birth-place he erected mills for the manufacture of alpaca, and for the benefit of his work-people founded the model village of Saltaire. It is situated on the Aire, 3 miles from Bradford.

SALTPETRE, or nitre, is nitrate of potassium, a substance used in the manufacture of gunpowder (which see).

SALT SEA. See *Dead Sea.*

SALT, SPIRITS OF, muriatic or hydrochloric acid.

SALUTATIONS, the various forms of greeting made use of at meeting or parting. The kiss, which is still employed by royal personages on ceremonious occasions, and which persists also in the custom of kissing the hand of a monarch, was the general form of salutation in England until the time of Charles II., and continued so in country districts until a much later period. The same custom existed among the Jews, Greeks, and Romans and was adopted by the early Christians as a sign of fellowship. Handshaking is now general in all civilised countries. Other modes of greeting are seen in the custom of rubbing noses in vogue in Lapland and among the Maoris, and in the stroking the face with the hand or foot of the person met, as practised by the Polynesians. Bowing varies in degree, from the slight inclination of the head and body to complete prostration in the dust. This last method of saluting a superior is met with in China and Siam. From very ancient times the words made use of in salutations consisted of various expressions of blessing, e.g., "God be gracious unto thee" (Gen. xliii. 24). A similar form is seen in the English *Good bye*, "God be wi' ye," and in the French *Adieu*, "To God."

SALUTE. There are several modes of saluting; firing guns, dipping colours, flags and topsails, manning yards, presenting arms, &c. A royal salute consists in the discharge of a great gun twenty-one times, in the lowering by officers of their sword-points, and in the dipping of their colours.

SALVADOR, the smallest but most densely populated of the republics of Central America, has an area of 7,200 square miles, and a population exceeding one million, about three-fourths of whom are of mixed race, the remainder being Indians. Agriculture employs the majority of the people, and the country produces coffee, indigo, sugar, rubber, and tobacco. San Salvador, the capital, population about 60,000, has suffered frequently from earthquakes.

SALVAGE. Refer to *Index.*

SALVATION ARMY, the outgrowth of the Christian Mission founded by William Booth, a Methodist minister, in the East End of London in 1865. The society adopted its present name and semi-military organisation in 1878. It aims at reaching those who are too degraded or indifferent to be influenced by other religious bodies. Its "soldiers" are divided into "corps," commanded by officers who assume military titles, captain, major, colonel, brigadier, etc., the whole being under the supreme command of "General" Booth, assisted by his chief of staff and commissioners. In addition to 15,000 officers supported from the funds of the society, there is an army of 45,000 voluntary workers, each of whom undertakes a definite task. In addition to its religious work, the "Army" seeks to aid the very poorest, and for this purpose has started in various parts of the world hundreds of shelters, rescue-homes, and labour-factories, and a farm colony at Hadleigh-on-Thames, Essex. In September, 1904, the "General" propounded a scheme for providing shelters for the homeless outcasts of London. The Army possesses training homes for officers, trading and publishing departments, and extensive printing works. The total circulation of its illustrated magazines and newspapers exceeds 46 millions annually (see *Booth, William*).

SALVATOR ROSA. See *Rosa, Salvator.*

SAMARCAND, a province of Russian Turkestan. With the exception of an extremely fertile river valley the land is mostly desert. The capital, Samarcand, is connected by railway with the Caspian. It contains many remains of beautiful architecture, the finest mosque in Central Asia and the tomb of Tamerlane.

SAMARIA (1) The central province of Palestine in the time of our Lord, lying between Judea and Galilee. (2) The capital of the Kingdom of Israel, situated about 40 miles N.N.W. of Jerusalem. The city was built by Omri, about 925 B.C., and continued to be the metropolis of the Ten Tribes until they were carried into captivity by Shalmaneser, 720 B.C.

SAMARITANS, a mixed race of people sent by Shalmaneser, King of Assyria, to occupy the land vacated by the Israelites whom he had transported to his own kingdom. On the return of the Jews from Babylon, the offer of the Samaritans to assist in the re-building of the Temple was rejected, in consequence of which they hindered the work as much as possible. This gave rise to the hatred that ever afterwards existed between the two peoples.

SAMOA, or Navigators' Islands, a group of fourteen volcanic islands surrounded by coral reefs in the South Pacific. In 1899 Britain relinquished her claim to these islands, and consented to an arrangement by which Germany took possession of the two largest and the United States the remaining ones. R. L. Stevenson is buried on the top of a Samoan mountain near his home of Vailima, where he spent the last five years of his life. The chief exports are copra and cocoa beans.

SAMOS, an island 30 miles in length, in the Ægean Sea, near the coast of Asia Minor. Its highest point is 4,725 feet. The island gives its name to the ancient red Samian ware so well known in the Roman sections of our museums. The inhabitants are Greek in sentiment and are governed by a Greek prince, but pay tribute to Turkey.

SAMPSON, WILLIAM THOMAS, *b.* 1840, *d.* 1902, an American naval officer, who in the war between the United States and Spain, commanded the fleet that destroyed the Spanish ships off Santiago, Cuba, 1898.

SAMSON, an Israelite of the tribe of Dan, one of the "Judges," and famous for extraordinary strength which he used against the Philistines. His exploits are related in the Book of Judges, chapters xiii.–xvi.

SAMUEL, the last of the judges of Israel, was consecrated by his mother to the service of God from his birth. He assisted Eli, and on his death succeeded him as "Judge." He revived the worship of Jehovah, established schools of the prophets, and made a yearly circuit of the country to administer justice. He anointed Saul king, and in consequence of his disobedience to God's commands in regard to Amalek, anointed David as his successor.

SANBALLAT, a Moabite who was governor of Samaria under Artaxerxes. He opposed every measure brought forward by Nehemiah for the welfare of Jerusalem (Neh. vi.). He built a temple on Mount Gerizim, and appointed Manasseh, his son-in-law and brother of the high priest at Jerusalem, to be its chief priest.

SAN BENITO. See *Auto da fé.*

SANCROFT, WILLIAM, *b.* in Suffolk, 1616, *d.* 1693, Archbishop of Canterbury, was one of the seven bishops committed to the Tower for petitioning against the "Declaration of Indulgence" of James II. On the accession of William and Mary he refused to take the oath of allegiance, was deprived of his archbishopric, and retired into private life.

SANCTUARY, a privilege formerly attached to certain buildings, in virtue of which criminals taking shelter therein were safe from arrest. From the beginning of the 4th century, in many countries, certain churches were set apart as asylums for fugitives from justice. In England these privileges were curtailed in the reign of Henry VIII., and were finally abolished in that of James I., though sanctuaries for debtors existed in and near London until 1697.

SAND, an accumulation of water-worn particles derived from pre-existing rocks or other mineral substances such as shells, volcanic debris, coral, etc. It is most commonly composed of quartz grains.

SAND, GEORGE, *b.* 1804, *d.* 1876, the pseudonym of Aurore Dupin, an eminent French novelist. Her early novels depict the life of Paris at the time of writing; those of a later date are marked by political, philosophical, and religious speculations; while those of the last period are beautiful studies of country life. "Indiana," "Consuelo," and "La Petite Fadette" may be mentioned as typical of these various characteristics.

SANDAL WOOD, the sweet-smelling wood of a tree growing chiefly on the Malabar coast of India, and in the islands of the East Indian Archipelago. It is used as a perfume, as a sedative, and is manufactured into light articles of furniture. The Brahmans also make use of the products of the tree in various religious ceremonies.

SANDHURST (1) A village in Berkshire, famous for its Royal Military Academy, at which candidates for commissions in the British Cavalry, Infantry, and the West Indian Regiments receive a special military education. (2) A flourishing city, at first, and now again, known as Bendigo, about 100 miles north of Melbourne, Victoria. It is the centre of a rich gold-bearing district.

SAN DOMINGO, capital of the republic of the same name, is a fortified port on the south coast of the island of Hayti. Its 16th century cathedral contained the remains of Columbus for nearly 250 years. The town was captured and pillaged by Drake in 1586; population 20,000.

SANDOWN PARK, a well known race-course at Esher, Surrey. There are five important meetings held here during the flat-racing season, and four steeplechase meetings.

SANDRINGHAM, a parish about 7 miles north-east of Lynn in Norfolk. Here in 1862, King Edward, when Prince of Wales, purchased an estate, 7,000 acres in extent, and here in 1870 he built Sandringham House, which in a special sense is His Majesty's home.

SANDWICH, one of the ancient Cinque Ports, Kent, 11 miles north of Dover. It was once on the coast, but the receding of the sea has left it about two miles inland; population about 3,000.

SANDWICH ISLANDS. See *Hawaiian Islands.*

SANDY HOOK, a sandy peninsula of New Jersey, about 18 miles from New York. At Sandy Hook Bay take place the races for the American Cup.

SAN FRANCISCO, the largest town in California, and the greatest commercial city on the West coast of America. It is the terminus of two lines of railway crossing the continent to the Atlantic coast, and is connected with China, Japan, Australia, and the Hawaiian Islands by regular lines of steamers. Its rapid rise was due to the discovery of gold in the neighbourhood, 1848; population 459 in 1847, and 380,000 in 1902. Here, in April, 1906, a terrible earthquake occurred, resulting in a fire that destroyed a large part of the city, causing a loss of about 1000 lives and property worth at least £50,000,000.

SANGREAL. See *Grail.*

SANHEDRIM, the supreme judicial council of the Jews from the time of the Maccabees to the destruction of Jerusalem. It consisted of 70 members, including the chief priests, elders, and scribes, and was presided over by the high priest. Its jurisdiction extended to every Jewish settlement.

SANITATION. Refer to *Index.*

SANKEY, IRA DAVID, *b.* 1840, an American evangelist and writer of hymns and tunes. For 29 years he assisted Mr. Moody in his work as an evangelist, and by means of his hymns contributed much to their success. Many millions of his hymns and sacred songs have been sold. See *Moody.*

SANKT MORITZ, a celebrated health resort in Switzerland, situated near the river Inn in the Upper Engadine.

SAN MARINO, an independent republic in the north-east of Italy, and, next to Monaco, the smallest state in Europe, having an area of only 33 square miles. It comprises a town of the same name, and several villages on the eastern slopes of the Apennines.

SANPO. See *Brahmaputra.*

SANSCULOTTES, a name applied in contempt by the Court Party to the mob during the early days of the French Revolution. Literally the term means "without breeches," but its application referred to the rejection of knee breeches by the people and the substitution of loose trousers. The retention of knee breeches as a feature of court dress at the present day has thus a curious bearing upon this question.

SAN SEBASTIAN, an important fortress, a busy seaport, and a favourite watering-place on the north coast of Spain, a few miles from the French frontier. The town was besieged and taken by Wellington in 1813.

SANSKRIT, the language in which the greater part of the ancient Hindu sacred literature was written, though it has not been a spoken language during the Christian era. It belongs to the Indo-European family of languages.

SAN STEFANO, TREATY OF, the preliminary treaty, signed at the village of San Stefano, a few miles west of Constantinople, which ended the Russo-Turkish War, 1878. Many of its articles were afterwards considerably modified in favour of Turkey by the Treaty of Berlin.

SANTA CLAUS, a contraction of Saint Nicholas, bishop of Myra, Asia Minor, in the 4th century. He is the patron saint of children, and is fabled to bring presents to them on Christmas Eve.

SANTIAGO (1) The capital of Chile, stands on a fertile tableland at the foot of the Andes. Most of the houses are of one storey as a precaution against earthquakes; population 336,000. (2) A seaport on the south-east coast of Cuba, carrying on a considerable trade with Europe and America. The chief exports are sugar, tobacco, timber, and fruits. The town was captured from the Spaniards by American troops in 1898.

SAÔNE, a tributary of the Rhone, rises in the Vosges Mountains, and joins the main stream at Lyons, after a course of 280 miles. The river is navigable for nearly 200 miles, and by means of canals it communicates with the Loire, Seine, and Rhine.

SAPPHIRE, a blue, transparent variety of corundum. The finest specimens of the gem, which is exceedingly hard, are found in the sands of rivers and in alluvial deposits in Ceylon.

SAPPHO, a Greek lyric poetess who flourished in the 7th century, B.C. Little is known of her life, and of her works only a few odes and some fragments of hymns and elegies have come down to us.

SARACENS, the name originally of an Arab tribe that harassed the frontiers of the Roman Empire, and afterwards applied to all the Arabian tribes who embraced Mohammedanism, and who extended their conquests over Syria, Persia, Egypt, and North Africa. To the Crusaders the term was synonymous with infidels.

SARAGOSSA, a town on the Ebro, in Spain. It contains two cathedrals, a leaning clock-tower, and many interesting relics. During the Peninsular War it became famous for its gallant defence when besieged by the French. It was obliged, however, to capitulate after a prolonged siege, 1809.

SARATOGA SPRINGS, in New York State, one of the most popular watering-places in the United States on account of its mineral springs. The scene of the surrender of General Burgoyne and his army of 6,000 men, in 1777, lies about 12 miles to the east of the town.

SARAWAK, in the north-western part of Borneo, proclaimed a British protectorate in 1890. It was in 1842 made over to an Englishman, Sir James Brooke, and for nearly 50 years administered by him and by his nephew.

SARCOPH'AGUS. A species of limestone used by the Greeks for coffins, and so called because it was supposed to consume the flesh of the dead. (*Sarcophagus* meaning "flesh-eating.") Hence the name came to be applied to a stone chest, more or less ornamented, for receiving a dead body.

SARDINE, a fish of the herring family, closely resembling the pilchard in form, but smaller in size. Immense shoals frequent the Mediterranean and the Brittany coast, but the Breton fishermen have found, in recent years, a great falling off in the supply. Numbers are sold in the fresh state, but by far the larger quantities are cured and preserved by being boiled in oil, and then packed in hermetically sealed tins or glasses.

SARDINIA, next to Sicily the largest island in the Mediterranean. It lies to the south of Corsica, from which it is separated by the Strait of Bonifacio. It now forms part of the Kingdom of Italy.

SARDOU VICTORIEN, *b.* 1831, a French dramatist of European reputation. Among his earlier plays are "La Papillone," "Nos Intimes," "Les Vieux Garçons," and "Odette," written between 1862 and 1881. He then wrote a series of dramas, beginning with "Fédora," to display the talents of Sarah Bernhardt. Of his later plays the most notable is "Madame Sans-Gêne." Many of his plays have been adapted for the English stage; among them, "A Scrap of Paper," the English rendering of his first successful comedy, "Les Pattes de Mouche."

SARGASSO SEA. See *Atlantic Ocean.*

SARGENT, JOHN SINGER, R.A., portrait painter, *b.* at Florence, 1856, of American parentage, was educated in Italy and Germany, and studied art under Carolus Duran. As a portrait painter he has attracted great attention by his originality of style and vivid portraiture. Among his best known portraits are those of Ellen Terry, Mr. Chamberlain, and Mr. Wertheimer. Elected R.A. 1897.

SARTO, ANDREA DEL, *b.* at Florence, 1488, *d.* 1530, a celebrated artist who possessed a wonderful imitative skill. Many of his works in oil or fresco are to be seen in the galleries of Florence, Paris, and Dresden, and a celebrated portrait of himself forms one of the treasures of our National Gallery.

SASKATCH'EWAN. A province carved out of the North-West Territories of Canada lying north of Manitoba and Assiniboia, and east of Alberta, having an area exceeding 107,000 square miles. Most of the land is included in the great prairie wheat belt. The province is crossed from west to east by the river Saskatchewan, which rises in the Rocky Mountains in two great branches known as the North and South Forks, each about 800 miles in length; 280 miles after the junction the river enters Lake Winnipeg.

SATELLITES, i.e., "attendants," are the smaller bodies or moons that revolve

round the planets. The Earth has one, Mars two, Jupiter four, Saturn eight, Uranus four, and Neptune at least one.

SATIN, a soft, closely woven, glossy silk. Owing to peculiarities in weaving, the weft is hidden beneath the warp. The latter presents an even and smooth surface, which reflects light freely, and thus gives the material its characteristic lustre. The chief centres of its manufacture are Lyons, Genoa, and Florence.

SATIN-WOOD, the timber obtained from a small tree growing in India and Ceylon, and from a larger species which is a native of the West Indies. The wood, which is suitable for all kinds of ornamental work, is hard, close-grained, of a light orange colour, and capable of taking a high polish.

SATIRE, a species of literary composition that exposes, ridicules, and censures the vices and follies of the age. It originated among the Romans. Horace and Juvenal excelled in the art. Dryden, Pope, Swift, and Byron may be mentioned as English writers who have employed it in their works.

SATURN. (1) In Roman mythology, Saturn was the god of agriculture. He is usually depicted as an old man, bent with age, holding a sickle in his right hand. (2) The sixth planet in order of distance from the sun and the second in size. It rotates upon its axis in 10¼ hours, and revolves round the sun in slightly less than thirty years. The most remarkable thing about Saturn is the series of bright rings that surround it, about 10,000 miles distant from it, and almost in the same plane as its equator. It is thought that the rings represent a vast aggregation of small satellites. In addition the planet has at least eight moons.

SATURNALIA, a festival in ancient Rome in honour of Saturn. All classes gave themselves up to merriment. No public business was transacted, the slaves enjoyed temporary freedom, master and servants changed places, and some prisoners were released.

SATYRS, in Greek mythology, a race of woodland deities who roamed the hills in the time of Dionysius (Bacchus). They are represented with long ears, flat noses, a man's body, and the legs and hoofs of a goat.

SAUL, of the tribe of Benjamin, was the first king of Israel. He distinguished himself in wars against the Ammonites, Philistines, Moabites, and others, but his disobedience to the divine command led to the anointing of David in his stead. Saul made several futile attempts on the life of his rival. He finally ended his own life by falling on his sword after his forces had been defeated by the Philistines.

SAUMUR, a town on the river Loire, which manufactures linen, leather, enamel, and glass. It has an important trade in sparkling wines. Until the revocation of the Edict of Nantes it was a stronghold of the Huguenots.

SAUNDERSON, NICHOLAS, a blind mathematician, *b.* 1682, at Thurlstone, Yorks., *d.* 1739. He lost his sight in infancy, but was well educated. He lectured on Newton at Cambridge, and was appointed Lucasian Professor of Mathematics. He published an "Elements of Algebra" (2 vols.) and a treatise on "Fluxions." His knowledge of geometry, a science that would appear to demand the sense of sight, was deep and accurate.

SAVANNAH. (1) The chief seaport of the State of Georgia, and the second cotton port of the United States. In addition to cotton, the exports include timber, rice, flour, and tobacco. (2) A general name for a prairie in the tropical parts of North America.

SAVINGS BANKS. Refer to *Index.*

SAVONARO'LA, GIROLA'MO, *b.* at Ferrara, 1452, *d.* 1498, an Italian political and religious reformer. He was educated for the medical profession, but became a Dominican monk. In Florence he headed the party that was agitating for a more democratic form of government, and he preached constantly with wonderful fervour against the immorality of the clergy and the vices that prevailed unrebuked by the Church. For a time he was practically dictator of Florence. But he incurred the enmity of Pope Alexander VI., was tried by a spiritual court, and, under torture of the rack, confessed that he had falsely claimed supernatural powers. The sentence of the court, that he should be strangled and then burned, was carried out in 1498.

SAVOY CONFERENCE. A conference of Episcopalians and Presbyterians held at the Savoy Palace, London, in 1661, for the purpose of revising the Book of Common Prayer. The two parties separated at the end of four months without settling any of the points in dispute, and feeling more bitterly hostile towards each other than before.

SAWDUST, the small fragments produced in sawing timber is of some commercial value. Large quantities of oxalic acid are prepared by treating it with caustic potash. Sawdust obtained from mahogany and rosewood is employed in the process of dressing furs, while that produced from cedar and other sweet-smelling woods is of value in the manufacture of perfumes. *Bois-durci,* (wood hardened) which has the appearance of polished ebony, and is used for the manufacture of various ornaments, is produced by mixing the sawdust of ebony and rosewood with blood, and compressing the mixture.

SAXE-COBURG-GOTHA, one of a group of four Saxon Duchies, sovereign states, in Central Germany. Saxe-Altenburg, Saxe-Meiningen, and Saxe-Weimar are the sister states. The sovereign houses boast a common Saxon origin and are united by family bonds. The Prince Consort was a second son of the house of Saxe-Coburg, but as his elder brother died childless, the succession passed to the Prince Consort's second son, the Duke of Edinburgh. On his death the throne was occupied by his nephew, Leopold, Duke of Albany. As the Duchy consists of two detached portions there are two capitals, Coburg and Gotha. Population of the Duchy about 230,000.

SAXONS, a Teutonic race who lived along the banks of the Elbe, and on the islands near its mouth, early in the 2nd century. They were a warlike and piratical people. In the 5th and 6th centuries they crossed to Britain in considerable numbers, and settled in the south of England, where the names Middlesex (Middle Saxons), Sussex (South Saxons), and Wessex (West Saxons), still bear witness to their influence. Those who remained in Germany extended their territory southwards by conquest, and it is this southern and mountainous part of the old kingdom that now bears the name of Saxony.

SAXONY, THE KINGDOM OF, ranks third among the states of the German Empire, and is the most densely populated; population about 4½ millions. The country is rich in coal, silver, and other minerals. The manufactures of wool, cotton, machinery, and paper are very important, employing nearly two-thirds of the inhabitants. Chief towns —Dresden, the capital, Leipzic, Chemnitz, and Freiberg.

SCAB is a disease of sheep caused by a parasitic mite which burrows in the skin. Affected sheep should be isolated and dipped in an arsenical wash.

SCAGLIOLA, a composition made to imitate marble and other ornamental stones. It is composed of finely powdered plaster of Paris, mixed into a paste with alum and a thin solution of glue. The veining or other colouring is usually produced by means of ochres. Columns and other objects for interior decorations are made of a framework of wood, and covered round with laths that receive a coating of mortar, upon which the scagliola is laid while still moist. Splinters (It. *scagliole*) of spar, marble, granite, etc., are pressed into it and made level with the surface. After it has set hard it is rubbed with pumice stone, and then polished.

SCANDINAVIA, in its more restricted application, means the peninsula comprising Norway and Sweden; in its more extended application, it includes also Denmark and the adjacent islands. (See under *Denmark, Norway, Sweden.*)

SCAPE-GOAT. See *Azazel.*

SCAPULAR, part of the dress of the monks of certain orders, consisting of two woollen bands, one of which crosses the shoulders and the other the breast.

SCARABÆUS, the sacred beetle of the Ancient Egyptians, was held in great veneration. Figures of it, carved in stone, were worn as amulets, and its body was sometimes embalmed.

SCARBOROUGH, a popular watering place in Yorkshire, beautifully situated on two sandy bays, separated by a rocky promontory. The harbour is much used as a shelter from easterly gales; population exceeds 38,000.

SCHAFFHAUSEN, FALLS OF, form one of the finest cascades in Europe. They occur on the Rhine, about 3 miles below the Swiss town of Schaffhausen. The waters of the river, which is here about 120 yards broad, are precipitated in three separate cascades, over a ledge of rock more than 70 feet in height.

SCHAMYL, *b.* 1797, *d.* 1871, a Caucasian chief who, from 1830 to 1859, resisted the Russian attempts to annex Caucasia. He inflicted many defeats and heavy losses on his enemies, sometimes invading Russian territory, and retiring to his mountain fastnesses when hard pressed. In 1859, after losing nearly all his followers, he was compelled to surrender. He was sent to St. Petersburg, received a pension of 10,000 roubles, and was allotted the town of Kaluga as a residence.

SCHIEDAM, a town in the province of South Holland, on the river Maas, about 4 miles from Rotterdam. The staple manufacture is Hollands gin, for the production of which there are nearly 200 distilleries in the town and its environs.

SCHILLER, FRIEDRICH VON, *b.* in Wurtemberg, 1759, *d.* 1805, a German poet, dramatist, and historian. "William Tell" is considered the finest of his tragedies, and his historical works include the "History of the Netherlands" and the "History of the Thirty Years War."

SCHISM, THE GREAT PAPAL, a separation in the Roman Catholic Church caused by a division in favour of rival candidates for the papal chair. It began in 1378, when Urban VI. and Clement VII. both claimed to be Pope, and ended in 1429 with the abdication of Clement VIII.

SCHLEIERMACHER, FRIEDRICH, *b.* at Breslau, 1768, *d.* 1834, a distinguished German theologian and philologist. His study of Plato, Kant, and other philosophers led him to reject the teaching of the Moravians, among whom he had been educated. He was opposed to all dogmatic formulas, contending that religion is based on the feeling.

SCHLESWIG-HOLSTEIN, the southern portion of the peninsula of Jutland, now forming a province of Prussia, but previous to 1864 a part of the kingdom of Denmark. The treatment of the German inhabitants, especially the compulsory use of the Danish language in the state schools, led Prussia and Austria to commence hostilities, and the Danish king was compelled to renounce his rights to the territory. At first Schleswig was administered by Prussia, and Holstein by Austria, but after her defeat at Sadowa, in 1866, Austria relinquished the whole to Prussia.

SCHNITZER, EDWARD, better known as *Emin Pasha* (which see).

SCHOLASTICISM, the name given to the system of thought and education countenanced by the Church from about the 9th to the 15th century. The Renaissance was an intellectual revolt against the narrowness of scholasticism, just as the Reformation was a revolt against religious abuses in Europe during the Middle Ages.

SCHOMBERG, FRIEDRICH VON, *b.* 1619, was a distinguished soldier who became a marshal of France, but quitted her service on the revocation of the Edict of Nantes. In 1688 he accompanied William of Orange to England, and in the following year was sent to Ireland in command of an army to oppose the adherents of James II. He was killed at the battle of the Boyne, July 1st, 1690.

SCHOOLMEN, men versed in the niceties of the scholastic philosophy, such as Duns Scotus, Thomas Aquinas and Bonaventura. See *Scholasticism*.

SCHOONER, a small, swift-sailing vessel with two or three masts rigged either with fore-and-aft sails only on all the masts, or with two square sails, the top and top-gallant sails, on the foremast, and the remainder fore-and-aft sails. As this particular rig is favourable to a high rate of speed, it is the one most commonly employed for the larger class of yachts.

SCHUBERT, FRANZ PETER, *b.* at Vienna, 1797, *d.* 1828, excelled as a musical composer of ballads and songs. His compositions also include operas, masses, symphonies, cantatas, and quartets.

SCHUMANN, ROBERT, *b.* in Saxony, 1810, *d.* 1856, a distinguished German composer and musical critic, whom his fellow-countrymen rank with Beethoven, and regard as the founder of a new school of musical composition. His best known work is the cantata, "Paradise and the Peri." He also composed several symphonies and songs.

SCHWEINFURTH, GEORGE AUGUST, *b.* at Riga, 1836, a famous German traveller who explored a portion of the centre of Africa. His book, "The Heart of Africa," contains an account of his journeys and of the Mid-African tribes.

SCILLY ISLANDS, a group of several islands and numerous clusters of rocks lying about 27 miles south-west of Land's End, Cornwall. The largest is St. Mary's. The climate is remarkably mild, and the inhabitants are chiefly employed in cultivating early vegetables and growing flowers for the London market.

SCINDE. See *Sind*.

SCIPIO AFRICANUS, *b.* about 235, *d.* 183 B.C., was one of the most illustrious Roman generals, and the great opponent of Hannibal. He was appointed proconsul in Spain, and succeeded in expelling the Carthaginians from the country. He received the surname of Africanus after his return from the successful campaign in Africa, in which he totally defeated Hannibal at Zama.

SCONE, a village in Perthshire, on the river Tay, 2 miles from Perth. The kings of Scotland were formerly crowned in its abbey, while seated on the "stone of destiny," now in Westminster Abbey.

SCORPION, an animal of the same class as the spiders, but differing from them in possessing a long, segmented abdomen, followed by a post-abdomen, the last joint of which bears a sharp claw at its end, in which is the duct of a poison-gland. With this claw the animal is able to inflict painful and, in the case of delicate persons, dangerous wounds. Scorpions chiefly inhabit tropical countries, hiding under stones and in dark places, and feeding on insects.

SCOT AND LOT, an ancient legal phrase denoting all parochial payments for the poor, church, watch, light and cleaning. In many places parliamentary votes were confined to payers of SCOT and LOT. The term *scot* which means payment, occurs in the phrases *scot-free* and "paying one's *shot*."

SCOTCH FIR. See *Pine*.

SCOTISTS, followers of *Duns Scotus* (which see).

SCOTLAND forms the northern portion of the island of Great Britain. Much of the surface consists of rugged mountains, bare moors, and heath-covered hills, especially in the north and north-west, a part known as the Highlands. Much of its scenery is famed for its picturesque beauty, and its mineral wealth is considerable. The west coast is bold and indented with deeply-penetrating arms of the sea, known as lochs or firths, and is protected by a double chain of islands, while the east coast is comparatively low and shelving, with few openings and islands. The highlands have numerous lakes. The chief commercial rivers are the Clyde and the Forth. The lower course of the Clyde is through a busy mining and manufacturing district in which many thousands are employed in the production of iron, cotton, woollen, and silk goods; and between Glasgow and Greenock the river passes a succession of ship-building yards which are capable of turning out the finest liners or the largest battle ships. Edinburgh is the capital, but the largest town and chief manufacturing centre is Glasgow. The principal ports are Glasgow, Aberdeen, Leith, Dundee, and Greenock. Scotland, including the islands, has an area of nearly 30,000 square miles. The country, which is divided into thirty-three counties, is represented in the British Parliament by sixteen representative peers and seventy-two members of the House of Commons. The population is about 4½ millions. Refer to "Scotland" in *Index*.

SCOTLAND YARD, in Whitehall, was the head-quarters of the Metropolitan police previous to 1890. It is said to have derived its name from a palace that formerly occupied the spot, and in which the Scottish ambassadors were lodged. New Scotland Yard is on the Thames Embankment, near Westminster Bridge.

SCOTS, a brave and warlike Celtic tribe from Ireland who were led to embrace Christianity by the preaching of Saint Patrick. Early in the 6th century they took possession of what is now the county of Argyle, and rapidly extended their conquests to the north. For three centuries there were constant wars between them and the Picts. In 843 Kenneth Mac Alpin overthrew the last of the Pictish kings, and united the kingdoms of the Picts and Scots into Scotland.

SCOTS GUARDS, a British regiment of foot, one of the regiments of the Household Brigade (See *Guards*). The term is one of great historical interest as denoting the body of Scottish troops who from 1418 to 1830 served the French crown. In "Quentin Durward," Scott gives a vivid picture of the life of these "Scottish Archers" in their early days. They were appointed a royal bodyguard, and though disbanded at the Revolution, they were again reinstated in all their privileges, only to disappear with the old French monarchy in 1830.

SCOTT, SIR GILBERT, *b.* near Buckingham, 1811, *d.* 1878, was the most eminent "Gothic" architect of his time. He built many churches and was also engaged in the restoration of many of the English cathedrals, including St. Alban's, Hereford, Ely, Lichfield, Durham, and Ripon. His other works comprised the Foreign Office, India Office, the Midland Railway Terminus and Hotel in London, Exeter College Chapel and the Martyrs' Memorial at Oxford, the new Quadrangle at John's, Cambridge, and the Albert Memorial in Kensington Gardens. He became an R.A. in 1860, and was knighted in 1872.

SCOTT, SIR WALTER, *b.* in Edinburgh, 1771, *d.* 1832, the famous novelist and poet, was educated for the Scottish bar. His earliest attempts in literature were translations from the German and the collecting and editing of old ballads. His first poem, "The Lay of the Last Minstrel," appeared in 1805. "Waverley" was published anonymously in 1814, and proved such a great success that other novels followed in rapid succession. He is said to have written the equivalent of thirty printed pages every day. In 1826, owing to the failure of two business houses, the author found himself penniless and in debt to the amount of £117,000. He at once undertook the task of paying off this sum, and in the next four years his creditors received £70,000. This tremendous effort brought on paralysis. "Marmion" takes the first place among his poems, and among his best novels are "Guy Mannering," "The Antiquary," "Old Mortality," "Rob Roy," "Ivanhoe," and the "Heart of Midlothian."

SCREW PROPELLER, a contrivance employed for propelling steam vessels. This method of propulsion was patented by Mr. Francis Smith in 1836. The screw consists of two or three spirally twisted metal blades fixed to a shaft, and revolving beneath the water at the stern of the vessel. The water plays a similar part to the nut in a screw-press, the revolving of the screw producing a thrust on the shaft which is transmitted to some well lubricated point within. In heavy seas, or in a deeply laden ship, the screw propeller has many advantages over the older paddle-wheel, since it is more constantly deeply submerged, and therefore producing efficient work. For this reason this mode of propulsion is now universally employed on ocean-going steamers, the use of the paddle-wheel being limited to vessels engaged in river work, or for passenger boats making short coasting voyages.

SCROGGS, SIR WILLIAM, became Chief-Justice of the King's Bench in 1678, and made himself infamous by his injustice and corruption. He was impeached in 1680 and dismissed from his office, but received a pension from Charles II. His death took place in 1683.

SCROLL. (1) A roll of paper or parchment or a manuscript in the form of a roll. (2) In architecture the term is applied to a common form of ornament consisting of folded or spiral bands, as in the volutes of the capitals of Corinthian and Ionic columns.

SCRUB, a name given in Australia to extensive tracts of land in the interior, that are covered with a species of bushy eucalyptus, bearing hard prickly leaves, and commonly known as the tea-tree. The bushes grow to a height of from 8 to 10 feet, and are so densely interwoven

with climbing plants as to be almost impenetrable.

SCULLING is the term applied to the propulsion of a boat by a single rower, either by means of a pair of short oars, called sculls, working in rowlocks in the centre of the boat, or by working a single oar from side to side with a screw motion over the centre of the stern, without raising the blade from the water. The latter method is usually practised on the sea, the former on smooth water.

SCULPTURE is that branch of art which is concerned in the reproduction of natural objects in solid substances, by carving or chasing in wood, ivory, or stone, modelling in clay, wax, or other plastic substance, or casting or beating out in various metals. The object may be represented either with or without an accompanying background. In the former case it is said to be in high-relief, *alto-rilievo*, or low-relief, *basso-rilievo*, according as the representation stands out boldly from the background, or is only slightly removed from it. When the object stands alone without a background, it is technically described as "in the round." The art has been practised from very early times. Specimens of Assyrian bas-reliefs may be seen in the British Museum, but the work of the ancient Greek sculptors excelled that of all others. The Venus of Milo, the Apollo Belvedere, the Elgin Marbles, and the Dying Gladiator are world-famous. The statue of Zeus in the temple at Olympia attracted visitors from distant countries for more than six centuries after its execution, and the Colossus of Rhodes was considered one of the "Seven Wonders of the World." The art of sculpture declined after the fall of the Roman Empire. There was a revival in the 14th and 15th centuries, followed by a second decline in the 17th. The modern revival dates from the end of the 18th century.

SCUTAGE, literally "shield-money," a money payment instituted by Henry II., as a composition fee by payment of which a knight might forego the necessity of performing his military duties. This enabled the king to levy mercenary troops abroad for a long term of service and left the merchants and others of knightly rank to pursue their vocations without interruption.

SCU'TARI. (1) A town in Asiatic Turkey, on the shores of the Bosphorus, opposite Constantinople, of which it is considered a suburb. The chief manufactures are cotton and silk. The barracks on the outskirts were used as hospitals by Florence Nightingale during the Crimean War. (2) The name of a province, lake, and seaport respectively, situated in the north-west of Turkey in Europe. The town possesses ship-building yards, and manufactures cotton goods. The exports include wool, wax, hides, and tobacco.

SCYLLA. See *Charybdis.*

SCYTHIANS, an ancient nomadic race inhabiting the steppes of Russia and Western Asia. They picked up some of the arts of civilization from the Greeks, and the eastern tribes established themselves by conquest in India.

SEA covers three-fourths of the earth's surface, or a total area of about 145 million square miles. This vast area is divided into five oceans; the Atlantic about 25 million square miles, the Pacific 90 million square miles, the Indian 23 million square miles, the Arctic, and the Antarctic. The smaller divisions of the ocean are known as seas. The average depth of water is about 12,000 feet. This is exceeded in many places. The Challenger Expedition reported a sounding slightly exceeding 27,000 feet, a little to the north of the Caroline Islands, in the Western Pacific; American surveyors have recorded a depth of 30,000 feet off the eastern shores of Japan; and a sounding exceeding 27,000 feet has been obtained north of the Virgin Islands in the West Indies. One of the most striking characteristics of sea-water is the quantity of salts, chiefly common salt, held in solution, averaging about 3½ per cent. by weight. The proportion varies in different localities. It is highest in the tropics, where the evaporation is greatest. In those land-locked seas of temperate regions that receive a large volume of river-water, it is much below the average. The waters of the Baltic are merely brackish, containing less than 1 per cent. of salt in solution. The waters of the ocean are in constant motion. The inequalities of temperature, polar cold and tropical heat, assisted by the prevailing winds, gives rise to a continuous flow of surface water from the Equator towards the Poles, equilibrium being restored by under-currents from the colder regions. In this way are produced the Equatorial Currents which are felt in the three great oceans. The direction of these is modified by the diurnal motion of the earth, and by the contour of the land bordering the oceans. The attractive force exerted by the moon, and to a lesser degree by the sun, gives rise to the tidal wave which flows round the earth from east to west, varying in height from a few inches in large open expanses like the Pacific Ocean, to 50, 60, or even 70 feet in narrowing gulfs like the Bay of Fundy. The friction of currents of air on the surface of the water gives rise to ordinary waves. The use of trawls, dredges, and tow-nets has shown that animal life exists at all depths. Plant life is more dependent on sunlight, and as sunlight can penetrate only to a certain depth, plant life is found only at or near the surface.

SEABURY, SAMUEL, *b.* in Connecticut, 1729, *d.* 1796, studied medicine at Edinburgh and returned to America as a missionary of the S. P. G. In 1783 he was elected bishop by his fellow clergy, and came to London for consecration. The timidity of the English bishops, who were afraid to act without the sanction of the Government, led to a delay of more than a year, and he was finally consecrated in a house in Aberdeen by three Scottish bishops. He thus became the first bishop of the American Episcopal Church, and through him and the Scottish Episcopacy the American bishops claim apostolic succession.

SEAL, a term applied to the engraved stamp used for making impressions on the wax used for closing letters, etc., or placed at the end of legal and other documents to ratify them; and also to the substance thus impressed. Originally a seal on a document was a substitute for a signature, and showed the concurrence of the owner of the seal in the contents of the document. The employment of seals is of very ancient date. The British Museum contains specimens that bear the signature of Egyptian monarchs. Various materials have been employed for receiving the impress: fine clay, bees-wax, lead, and other metallic substances. In England three seals are officially used in the name of the sovereign: (1) The *Signet* is in the keeping of the Home Secretary; (2) the *Privy Seal*, which is affixed to letters-patent, is in the keeping of the Lord Privy Seal; and the possession of the (3) *Great Seal* confers his powers upon the Lord Chancellor.

SEAL, THE, the name commonly given to a family of aquatic, carnivorous mammals inhabiting the sea-coast in all high latitudes. The animals are hunted for the sake of the oil they produce and for their skins. The largest variety is known as the *Sea Elephant*. A single adult male of this species has produced 70 gallons of oil. The seal skin of the furrier is obtained from a species commonly called the *Sea Bear*. Next to the skin this animal has a covering of thick, soft wool, of a reddish brown colour. In the process of dressing, this wool is left adhering to the skin, while the entire coating of long, greyish brown hairs is removed. The principal fisheries are on the islands and coasts of Behring's Sea. The *Walrus*, or *Sea Horse*, furnishes the Eskimos with almost every article in daily use amongst them. The *Common Seal* was formerly abundant on the British coasts, and proved very destructive to the fisheries.

SEALED ORDERS are delivered to the commanding officer of a ship or squadron, the destination and object of which it is desirable to keep secret. The covering of the orders is to be removed only when the vessels have proceeded a certain distance, or after they have been a certain time at sea.

SEALING-WAX is composed chiefly of resin, Venetian turpentine, shellac, and some colouring matter. It was introduced into Europe from India, and was formerly in great request for the purpose of fastening letters, but the introduction of adhesive envelopes considerably reduced the demand.

SEA-SERPENT. Many reports on the appearance in the ocean, particularly in the tropics, of gigantic animals of serpentine form have been published by eye-witnesses of repute. Captain M'Quhae reported such an encounter in 1848, the animal passing so close to H.M.S. *Daedalus* that the captain stated it would have been easy to distinguish the features of a man at the same distance. The animal was travelling with its head and neck raised above the surface of the water, and about 60 feet of the length of its body was visible. The officers of H.M. yacht *Osborne* reported a similar appearance off the Scilly Islands, July 2nd, 1877, and numerous other instances are on record. The most satisfactory explanation of these appearances would seem to be that the animal seen was really a gigantic cuttle fish, a creature that, including its tentacles, attains a length of 40 feet. In other instances, the appearance was probably nothing more than a flock of sea-birds skimming the surface of the water.

SEA-SICKNESS. See *Med. Dict.*

SEA-SNAKES are common in the tropical parts of the Pacific and in the Indian Ocean, particularly around the coasts of the East Indian Archipelago. The animals rarely exceed 8 feet in length. They are exceedingly venomous, possess fangs resembling those of the cobra, and prey on fish.

SEASONS, THE. These are due to the inclination of the earth's axis to the plane of the ecliptic. At one position of the earth in its orbit the northern end of the axis is inclined towards the sun, and the sun's rays strike perpendicularly upon the Tropic of Cancer, and therefore more directly and with greater power on all parts of the northern hemisphere, the greater length of daylight aiding in the accumulation of heat. This position is known as the summer solstice. Six months later the conditions are reversed. The South Pole is inclined to the sun, the vertical rays fall on the Tropic of Capricorn, the southern hemisphere receives the more direct rays, and enjoys its mid-summer at the winter solstice of the northern hemisphere. When the earth is midway between these two positions in its orbit, neither pole is inclined to the sun. The rays are perpendicular to the equator,

and therefore equally inclined to places in corresponding latitudes in the northern and southern hemispheres. These positions are the vernal and autumnal equinoxes.

SEA-WEEDS, a name given in common to all plants whose natural habitat is in sea water. Since the sun's rays are unable to penetrate beyond a certain depth, and sun-light is essential to the growth and development of plants, the sea-weeds are found only to a depth of from 50 to 100 fathoms. They differ considerably in form. Some are mere filaments, others are ribbon-shaped, others consist of tubes, either branching or unbranching, while others closely resemble the fronds of ferns. The prevailing tints are green, olive-brown, and red. On many parts of the coast sea-weeds are extensively used as manure, and are considered very valuable for potato crops. (See *Algæ*).

SEBASTIAN, SAINT, was a captain of the prætorian guard at Rome in the 3rd century, who embraced Christianity and suffered martyrdom under Diocletian. He was first pierced with arrows, none of which however touched a mortal part, and was afterwards beaten to death with clubs. In art he is usually represented tied to a tree, and pierced by a number of arrows.

SEBASTOPOL or **SEVASTOPOL,** a Russian fortified port and naval station, situated on a fine natural harbour in the south-west of the Crimea. During the Crimean War the town was destroyed, and fell into the hands of the allies, after a siege lasting from October, 1854, to September, 1855.

SECOND-SIGHT, a superstition formerly prevalent in the Highlands of Scotland, but now practically extinct. It ascribed to certain individuals the gift of being able to look into the future and to foresee events as if they were actually passing before their eyes. The visions were sometimes involuntary, at other times were produced after the performance of certain prescribed rites.

SECRETARY-BIRD, a South African bird of prey. It is of a slaty-grey colour, and averages about 3 feet in length. It receives its name from a peculiar band of feathers that projects from each side of the head, and that presents the appearance of a bundle of pens stuck behind the ears. Its food consists principally of snakes, lizards, and other reptiles. The bird attacks snakes of the largest kind; even the cobra falls a certain prey. Making use of its wings and feet as weapons, it raises its victim and stuns it by dashing it to the ground. This habit of destroying venomous reptiles has placed the bird under the protection of the law in Cape Colony.

SECRETARY OF STATE. Refer to *Index*.

SECRETION. See *Med. Dict.*

SECRET-SERVICE MONEY. The British Government, in common with those of other States, finds it necessary to expend money on objects that policy demands should not be made public. The minister is required to give an undertaking that it shall be spent in accordance with the intentions of Parliament. The amount voted under this head in 1903 was £65,000.

SECULARISM, a system of philosophy and ethics of modern origin, the leading tenet of which is freedom of thought. It is not opposed to any form of religion, as such, but insists only on the strict examination of all beliefs before accepting them, and asserts that a person's actions should be guided chiefly by reason.

SEDAN, a town on the right bank of the Meuse, in the department of the French Ardennes. It has been long famous for its woollens. On September 1st, 1870, a French army of 86,000 men, under Macmahon, was defeated by the Germans, and, together with the emperor Napoleon III., surrendered on the following day.

SEDAN CHAIR derives its name from the town of Sedan, where it is said to have been invented. It consisted of a covered chair, capable of carrying one person, and was borne on poles by a couple of bearers. It was introduced into England in 1634.

SEDATIVES. See *Med. Dict.*

SEDDON, RICHARD JOHN, *b.* near St. Helens, 1845, *d.* 1906, a famous imperialist statesman of New Zealand. In 1853 he left England for the goldfields of Australia, which he quitted for the gold-mines of New Zealand. His first stepping-stone to fame was his election to the Colonial Parliament in 1879. In 1893 he became Premier and held office as such to the end of his life. He was a socialist democrat and imperialist. In the Boer War he rallied thousands to the help of the mother country. So predominant was his influence in New Zealand that he was popularly styled "King Dick." On his death King Edward spoke of the "permanent place he had secured for his name among the statesmen who have most zealously aided in fostering the sentiment of kinship on which the unity of the Empire depends."

SEDGEMOOR, a district in Somersetshire, between Taunton and Bridgewater, the scene of the defeat of Monmouth's army by the troops of James II., 1685.

SEDIMENTARY ROCKS, a term used in geology to denote formations that have been deposited under water. Stratification is a mark of this type of rock, and among surface markings it is not uncommon to find rain marks, ripples, spoors, tracks and burrows, the relics of a time when the deposit was in a soft state by the margin of the water. Sandstones, conglomerates, shales, clays and mudstones belong to the sedimentary class.

SEDLITZ, or **SEIDLITZ,** a small town in Bavaria, famous for its mineral springs, the waters of which possess aperient properties. Ordinary Seidlitz powders have a different composition.

SEEDS are the principal agents by means of which the various species of flowering plants are perpetuated. They are produced by the fertilization of the ovule upon the plants. Each seed contains a young plant in the form of the embryo enclosed within the seed-coat. Seeds are dispersed by water, wind, animals, and mechanical contrivances. Some are so minute that they are able to remain suspended in the air for quite a long time. In the case of many larger and heavier varieties, the seed, or more generally the fruit, develops a contrivance that assists in the dispersion. This is well seen in the winged fruits of the sycamore, elm, and lime; the plumed fruit of the dandelion and thistle; the seed of the cotton grass embedded in a mass of silky hairs; and the plume-like appendages of the clematis or old man's beard. In other cases the elasticity of the stem in recovering its normal position after being bent aside by a passing animal or a sudden gust of wind, brings about a scattering of the seeds. The sudden bursting of gorse pods gives a sufficient impetus to the seeds to scatter them to some distance from the parent plant. Other plants that produce these so-called *sling* fruits are the American balsam and many species of geranium. Fleshy fruits form the food of birds, and in this way the seeds are dispersed. In numerous instances the fruit or seed is furnished with barbs or hooks, and is thus carried away by any animal brushing against the plant. Many of our most valuable food products are derived from seeds. Thus the various cereals are the seeds of highly-cultivated grasses. Peas, beans, and nuts are equally familiar.

SEELEY, SIR ROBERT, *b.* in London, 1834, *d.* 1895, became professor of History at Cambridge University in 1869. In addition to "The Expansion of England" and other historical works, he wrote "Ecce Homo" and "Natural Religion," two books that raised a great deal of hostile criticism on account of the unorthodox views expressed by the author.

SEINE, an important French river, rises in the tableland of Langres, and after passing Troyes, Paris, and Rouen flows into the English Channel. Its tributary, the Yonne, is connected with the Saône by a canal, and thus a waterway is provided between the English Channel and the Mediterranean Sea; length 480 miles.

SEINE-NET. See *Fishing*.

SELBORNE, (Roundell Palmer), **EARL OF,** *b.* 1812, *d.* 1895, was educated at Rugby, Winchester and Trinity College, Oxford, where his career was exceptionally brilliant. Entering parliament he became inturn Solicitor-General, Attorney-General, and Lord Chancellor. Differing from Gladstone on his Irish policy he declined in 1886 a third term of office as Chancellor. He was an able writer on Ecclesiastical questions, and a strong defender of the Established Church. He was created earl in 1882.

SELDEN, JOHN, *b.* near Worthing, 1584, *d.* 1654, one of the greatest of English scholars and lawyers. He established a good practice in the Inner Temple, but found leisure for study. He wrote on Anglo-Saxon and Roman law, Trial by Combat, History of Tithes, Titles of Honour, and a learned work on the Syrian deities. He joined the Parliament against James I., and afterwards helped to draw up the Petition of Right, for which he was imprisoned. In the war between Charles I. and Parliament he acted the part of peacemaker. On the execution of the king, of which he disapproved, he retired from public life. His tomb with a commemorative tablet is in the Temple Church; his books he bequeathed to the Bodleian Library.

SELF-DENYING ORDINANCE, a resolution of the Long Parliament, passed in April, 1645, the object of which was to remove from their command certain officers who were supposed to be half-hearted in the cause. It provided that no member of parliament should hold either civil or military office. Exception was made in the case of Cromwell and a few others.

SELTZER-WATER is obtained from mineral springs near the village of Niederselters, in Hesse-Nassau. The waters, the principal constituents of which are carbonic acid, carbonate of soda, and common salt, are said to have a beneficial action on the kidneys and liver. From 3½ to 4 million bottles are exported annually.

SELWYN, GEORGE AUGUSTUS, *b.* 1809, *d.* 1878, was the first bishop of New Zealand. He acquired a remarkable influence over the Maoris, and by his zeal and energy commanded the universal esteem of the English colonists. His Episcopate in New Zealand lasted twenty-six years. On his return to England, in 1867, he became bishop of Lichfield. Selwyn College, Cambridge, founded in 1882, was built to perpetuate his memory.

SEMAPHORE, an apparatus for conveying signals by means of two arms working on pivots fixed at the top of a mast. By the combination of these two arms it is possible to convey forty-eight distinct signals. Thus, having previously determined the particular combination that shall represent each letter of the alphabet and each digit, it is possible to

telegraph any message from one station to another. A system of semaphores was employed by the French in 1803, and later a similar method of signalling between London and Deal, Portsmouth and Plymouth, was adopted by the British Admiralty. The semaphore is still employed in ships, especially in calm weather, when signalling by flags is likely to be ineffective.

SEMIRAMIS and **NINUS,** her husband, were the mythical founders of the Assyrian Empire. The town of Ninus or Nineveh is supposed to have been built by them about 2182 B.C.

SEMITES, or **SHEMITES,** a term used to include the group of peoples comprising the Assyrians, Chaldeans, Syrians, Arabs, Jews, Abyssinians, Phœnicians, and Carthaginians. These are reputed to be all descended from Shem. They have much in common, in the structure of their language, their habits of thought, social organisation, religions, etc.

SEMOLINA is the name given to a coarse kind of flour prepared from the harder varieties of wheat, such as those of Naples and the south of Spain. In the process of milling, these larger grains are retained in the bolting-machine, while the finer flour passes through its meshes. Semolina is a valuable food product, possessing highly nourishing properties. A cheap imitation of semolina is manufactured from millet and maize.

SEMPACH, a small Swiss town, situated on Lake Sempach, a few miles north-west of Lucerne. It was the scene of a battle in which the Swiss routed a much larger force of Austrians, July, 1386. (See *Winkelried.*)

SENATE, i.e., "a council of elders," was the name bestowed by the Romans on their supreme legislative and administrative assembly. Its constitution and powers varied in different ages. At first it consisted of 100 members, afterwards increased to 300. Its powers, which reached their zenith during the republic, declined under the emperors. In modern times the term is applied to the upper house of the national legislature in many countries; e.g., in France and the United States of America. The governing body of a university is also called a senate.

SENECA, *b.* about 5 B.C., *d.* 65 A.D., a Stoic philosopher, who was appointed tutor to young Domitius, afterwards the Emperor Nero. On Nero's accession, Seneca did much for a time to restrain the vicious propensities of his former pupil, but his presence becoming irksome to the young emperor, he lost his influence and retired from court. He was afterwards suspected of sharing in a plot to dethrone the emperor, and ordered to take his own life. His fame rests on his numerous writings, which are chiefly on moral and philosophical subjects.

SENLAC, a hill about 6 miles north-west of Hastings, the scene of the victory of William the Conqueror over Harold, 1066, and the site of the small town of Battle.

SENNACHERIB, King of Assyria, 702–681 B.C. He greatly extended his dominions, and in 689 captured and, for a time, ruined Babylon. He made Nineveh the capital of his kingdom, and restored it to a position of great eminence. His siege of Jerusalem failed on account of a pestilence which ravaged his army. While worshipping in a temple, he was murdered by two of his sons.

SEOUL, on the river Han, is the capital of Korea, and the chief seat of the foreign trade of the country. The town, which consists chiefly of mean houses, is connected by rail with the treaty port of Chemulpo, with Fusan in the south-east, and Wiju on the Yalu; population about 200,000.

SEPIA, a genus of cuttle-fish common on the Mediterranean shores, and occasionally met with on the south coast of England. The animal secretes in a specially developed sac a brown inky material which it pours out in large quantities when pursued, and thus covers its flight. From this "ink" a fine brown pigment is prepared. Fossil cuttle-fish have been found so well preserved that the sepia in their ink-bag was used in drawing them.

SEPOY, a native soldier in the British Indian army. The Sepoys are trained and disciplined after the manner of the British army, and are commanded by British officers.

SEPOY MUTINY. See *Indian Mutiny.*

SEPTENNIAL ACT, an Act passed in 1716 for extending the duration of parliament to seven years. The Act was prompted by the Jacobite Rebellion of 1715, the fear of an invasion, and the high degree of exasperation existing in the political parties in the country.

SEPTUAGINT, the oldest Greek version of the Old Testament Scriptures. It is also known as the Version of the Seventy, because the work was reputed to have been performed by seventy or seventy-two translators, and in seventy-two days. More probably the translation was made for the use of the synagogue at Alexandria, for which reason it is called the "Alexandrine Version." More than 80 per cent. of the quotations from the Old Testament appearing in the New are taken from the Septuagint.

SERAGLIO, the palace of the Sultan in Constantinople, is not now his usual residence, but is occupied only on state occasions. Its walls enclose several mosques, extensive gardens, and buildings capable of accommodating 20,000 persons, the whole presenting a fine appearance when seen from the sea, as it occupies a splendid site on a tongue of land between the Golden Horn and the Sea of Marmora. The principal entrance is called the *Sublime Porte.* The term seraglio is sometimes applied to the women's quarters in the palace of an eastern monarch.

SERF, one of a class of slaves who, under the feudal system, were attached to the land they tilled and transferred with it, though they might not be sold away from it. The serf was able to acquire his freedom by purchase, by military service, or by residence in a borough during a year and a day. The extinction of serfdom in England and Scotland was a gradual process, but, except that mining serfs existed in Scotland as late as the 18th century, it had been completed before the close of the 16th century. In parts of Germany and in Italy the system had been abolished earlier, but in France it did not entirely disappear until the Revolution. The Russian serfs received their freedom by the ukase of Alexander II., published March 17th, 1861.

SERGEANTS, non-commissioned officers in the army ranking next in order above corporals. Each company of infantry has three sergeants and one colour-sergeant; and each troop of cavalry has three sergeants and one troop sergeant-major. The terms used in the Household Cavalry are corporals of horse and troop corporal-major. Each battery of horse artillery has six sergeants and a battery sergeant-major. A regimental sergeant-major is a warrant officer with general supervising duties but no particular command. In general, a sergeant is responsible for his men in barracks.

SERGEANT-AT-ARMS. Refer to *Index.*

SERGE, GRAND DUKE, son of Alexander II. of Russia, a determined opponent of political reform, regarded as the head of the bureaucratic party, and assassinated by the revolutionists, 1905.

SERINGAPATAM, the former capital of the province of Mysore in southern India, stands on an island in the river Cauvery. The fortress was three times besieged by the British, in 1791, 1792, and 1799. On the last occasion it was carried by assault, Tippoo Sahib, the Sultan of Mysore, falling during the attack.

SERPENTS, or **SNAKES,** form an order of reptiles known as *Ophidia.* See *Snakes.*

SERUM. See *Med. Dict.*

SERVIA, a mountainous country occupying a commanding position in the Balkan Peninsula. Its area exceeds 18,600 square miles, and the population, mostly of Slavonic origin, is about 2½ millions. There are large forests of oak, the acorns from which serve as the food for immense herds of swine, which, together with fruits and agricultural produce, form the principal exports. Belgrade, the capital, was the scene of the assassination in 1903 of King Alexander and Queen Draga by officers of the 6th Infantry Regiment.

SETON. See *Med. Dict.*

SETTLEMENT, ACT OF, passed in 1701, limited the succession to the English throne to the Princess Sophia of Hanover, granddaughter of James I., and her heirs, being Protestants. The Act also provided further security for the rights and liberties of the subject.

SEVEN BISHOPS, THE, were Sancroft of Canterbury, Ken of Bath and Wells, Lake of Chichester, White of Peterborough, Turner of Ely, Lloyd of S. Asaph, and Trelawney of Bristol. These petitioned James II. against his injunction that a Declaration of Indulgence (favouring Roman Catholics) should be read in all churches. They were accused of seditious libel and acquitted, to the great joy of the nation.

SEVEN CHAMPIONS OF CHRISTENDOM, THE. These were Saint George of England, Saint Andrew of Scotland, Saint Patrick of Ireland, Saint David of Wales, Saint Denis of France, Saint James of Spain, and Saint Anthony of Italy.

SEVEN DOLOURS OF THE B.V.M. They are (1) Simeon's prophecy; (2) The flight into Egypt; (3) The loss of Jesus in Jerusalem; (4) Jesus bearing the Cross; (5) Jesus on the Cross; (6) His descent from the Cross; (7) His entombment.

SEVEN SAGES. The name is commonly applied to seven philosophers of Ancient Greece who flourished about 500 years B.C., and were believed to be the authors of short maxims in which they embodied the main principles of their teaching. They were *Bias* of Priene, whose maxim was "Most men are evil"; *Chilo* of Sparta, "Consider the end"; *Cleobulus* of Lindos, "Seek the golden mean"; *Pittacos* of Mitylene, "Seize time by the forelock"; *Periander* of Corinth, "Nothing is impossible to industry"; *Solon* of Athens, "Know thyself"; and *Thales* of Miletus, "He who hateth suretyship is sure."

SEVEN SLEEPERS, THE. These were seven Christian youths who, according to a legend recorded by Gregory of Tours, took refuge in a cave near Ephesus from the persecutions of Decius. The entrance was closed by order of the emperor. They fell into a deep sleep, from which they were awakened after the lapse of two centuries. One of their number proceeded into the city to obtain food, and was surprised to find the emblems of Christianity everywhere. He was taken before a judge and was afterwards accompanied to the cave by the emperor, the bishop, and the magistrates, who found the sleepers still

in the bloom of youth. They repeated their story, blessed the multitude, and immediately expired. A similar legend is found in the Koran.

SEVEN WEEKS WAR, the short but decisive struggle between Prussia and Austria that arose in the spring of 1866 out of the partition of Schleswig-Holstein. The Prussians were everywhere victorious, and the war practically ended with the crushing defeat of the Austrians at Sadowa, 3rd July. As a result, Prussia became the head of the German confederation, from which Austria was excluded.

SEVEN WONDERS OF THE WORLD, THE. They were the Pyramids of Egypt, the Hanging Gardens of Babylon, the statue of Jupiter at Olympia executed by Phidias, the Mausoleum erected by Artemisia to the memory of her husband Mausolus, the Colossus of Rhodes, the Pharos of Alexandria, and the Temple of Diana at Ephesus.

SEVEN YEARS WAR, the name given to the contest between Prussia and Austria for the possession of Silesia. The greater part of Europe was involved in the struggle as the allies of the one or the other. The war broke out in August, 1756, and was concluded by the Peace of Hubertsburg, 1763. Prussia retained possession of Silesia and greatly increased her influence in Europe. At the end of the war England found herself the leading power in North America, and had also laid the foundation of her Indian Empire.

SEVERN, THE, a river that rises on the eastern slopes of Plinlimmon, and, after a course of 240 miles enters the Bristol Channel by a wide estuary. It is navigable as far as Welshpool. The tide in the estuary rises higher than in any other European inlet, and the "bore," which at times ascends the river with a height of 9 feet, is felt for a considerable distance from its mouth. A canal, navigable by vessels of 350 tons, connects Gloucester with the estuary, and other canals connect the Severn with the Thames, Trent, and Mersey.

SEVIGNÉ, MADAME, *b.* 1626, *d.* 1696, the most delightful of French letter-writers. Her 1,600 letters, most of which were to her daughter Madame de Grignan, are witty, sensible, affectionate and delightful in their quaintness of detail. They form a revelation of the inner history of her times. Her attachment to her family and friends, her tolerance, her blameless life, her personal beauty and charm of disposition have won for her a secure place in the affections of all who admire what is best in womanhood.

SEVILLE, the capital of the Spanish province of Andalusia, stands on the river Guadalquivir. The city contains many beautiful Moorish buildings, the finest of which is the Alcazar, or Moorish royal palace. The cathedral, which dates from the 15th century, is the largest in Spain, and contains paintings by Murillo and other masters. Seville is the centre of the Spanish sport of bull-fighting, the circus being capable of accommodating 14,000 spectators.

SÈVRES, a small town 10½ miles south-west of Paris, famous for its manufacture of porcelain ware. The industry has been carried on under Royal or State control since 1756.

SEWAGE. See *Med. Dict.*

SEWING-MACHINES. Simple machines for embroidery, quilting and leather-work, were devised in England during the 18th century. The modern sewing-machine, however, is of American origin, and unites two principal inventions, the *Howe* needle, and the *Wilson* four-motioned feed. The former is the well-known needle with the eye near the point, the latter is the device for gripping, urging forward, and passing on the material operated upon. Howe patented his machine in 1846, and it is the basis of all subsequent lock-stitch machines. In 1852 Singer patented his machine and this has been so improved from time to time as to become one of the best in the market. Litigation between various inventors terminated in 1854 in the agreement by all to adopt the Howe and Wilson patents paying royalties to the inventors so long as the patents held. There seems no limit to the number of uses to which sewing-machines are put. Leather working, boot making, carpet sewing, button sewing, button holing, glove stitching, fancywork of all kinds; indeed from the flimsiest gauze to the heaviest belting and harness all materials have their appropriate machines.

SEYCHELLES. Refer to *Index.*

SHAFTESBURY, EARL OF. See *Cooper, Anthony Ashley.*

SHAGREEN. (1) A kind of leather possessing a peculiar grain and used for covering cases, etc. It is manufactured at Astrakhan and in Asia Minor, from the skins of wild asses, horses, and camels. After the removal of the hair, while the skin is still soft, it is stretched on a frame-work and covered with a number of small seeds which are trodden into it, permitted to dry, and then beaten out. The leather is easily stained in various colours. (2) The skin of the shark.

SHAKERS, a popular name applied to a sect, founded about 1750, by James Wardlaw and Jane, his wife, under the title of "The United Society of Believers in Christ's Second Appearing." Ann Lee, a follower of the Wardlaws, went to America to escape persecution, and founded a communistic settlement there. There are now some fifteen settlements in the States possessing common property to the amount of ten millions. In manner of life they resemble strict Quakers, they pay much attention to education, and make no attempt to win converts.

SHAKESPEARE, *b.* at Stratford-on-Avon, 1564, *d.* 1616, was perhaps the greatest poet and dramatist of all countries and all ages. His mastery of language is shown in the extent of the vocabulary employed in his works—a vocabulary containing 21,000 words as compared with the 7,000 of Milton or the 5,000 of such a writer as Thackeray; and in the number of phrases invented by him that now enter so largely into the daily speech of the country. Hamlet alone supplies more than thirty such phrases, including such well used examples as—"Though last, not least." "As true as steel." "Every inch a king." and "A divinity that shapes our ends." To his mastery of language must be added his intimate knowledge and sympathetic portrayal of human nature in all its phases, and the number of good acting plays that fell from his pen. His works include a number of sonnets and other poems, besides his plays, which consist of comedies, tragedies, and historical plays. Shakespeare received his education at the grammar school of his native town. Early in life he proceeded to London and became attached to the Globe Theatre as an actor, and as an adapter and a writer of plays. The proceeds of his work, combined with the successful investment of his savings, enabled him to retire at the age of forty-eight to a house he had built for himself at Stratford-on-Avon, a few years previously.

SHALE, rock that has been produced by the compression of layers of mud. It possesses a more or less laminated structure by which it is distinguished from clay or marl. It is usually found in the neighbourhood of coal, and, in the case of large deposits, petroleum is obtained from it.

SHALMANESER became king of Assyria about 730 B.C. He twice invaded the territories of Hoshea, king of Israel, and on the second occasion besieged the capital, Samaria. During the siege, which lasted three years, he died. Sargon, his son and successor, took the city and completed the conquest of the country.

SHAMO, DESERT OF, same as *Gobi.*

SHAMROCK, a three-leaved plant indigenous to Ireland and held in honour as the national emblem of that country. The true shamrock, probably wood sorrel, is not accurately ascertainable, and the lesser yellow trefoil, of the clover kindred, is commonly sold in Ireland on St. Patrick's Day.

SHAMYL, a Mohammedan Mullah who led the Caucasian revolts against the Russians from 1830 to 1859, baffling his opponents again and again, surprising them by ambuscades, and keeping his followers in a state of fanatical enthusiasm. On his capture he was pensioned handsomely by the Russians, and died at Medina, 1871.

SHANGHAI, near the mouth of the river Yang-tse-kiang, is the chief commercial city of China. The central and walled part of the city consists of narrow and dirty streets; but a number of well-built suburbs have grown up outside the walls, those in the north forming the residential quarters of the foreign population, which numbers upwards of 7,000, largely composed of English and French. The principal exports are tea, silk, cotton, and rice; population exceeds 600,000.

SHANNON, the largest river of Ireland, rises in County Cavan, and flows through Loughs Allen, Ree, and Derg to Limerick, whence it opens out into a magnificent estuary. The river is 254 miles in length, and navigable for 213 miles.

SHANS, a people of Chinese origin, living in the upper valleys of Burma, Siam, and the Chinese territory adjacent. The Shan states of Burma were annexed after the third Burmese War in 1885, and a branch railway now runs up the Salwin valley into the Shan country.

SHARK, the name given to a large family of fishes inhabiting almost every part of the ocean, but most abundant in the tropics. They vary in size from the dog-fish to specimens found in the Indian Ocean and off the shores of Cape Colony, that attain a length exceeding 60 feet. The pointed snout overhangs the mouth, which is usually furnished with rows of large, sharp-cutting teeth. The skin is tough and covered with small calcified spines. The skeleton is composed wholly of gristle. The *Blue Shark* is fairly common off the coast of Ireland, and in summer visits the coast of Cornwall, where it preys on the shoals of pilchards and herrings. The *White Shark*, which abounds in warm seas, is a most formidable creature. It attains a length of from 20 to 35 feet, and its powerful jaws are capable of biting a man in two. The *Basking Shark* is a harmless species. It receives its name from its habit of lying motionless on the surface of the water. A species known as the *Greenland Shark*, inhabiting the Arctic Ocean, is said to attack the whale.

SHARON, a plain extending inland from the coast of the Mediterranean to the hills of Samaria, in Palestine, and reaching from Cæsarea to Joppa.

SHARP, GRANVILLE, *b.* at Durham, 1734, *d.* 1813, devoted a large portion of his life to the emancipation of the negro slave.

He wrote many pamphlets in its favour, took a prominent part in the formation of the Association for the Abolition of Negro Slavery, and was one of the founders of the Colony of Sierra Leone for the reception of liberated slaves.

SHARP, JAMES, *b.* at Banff Castle, 1618, *d.* 1679, pleaded the cause of Presbyterianism before Cromwell, and in 1660 was sent to Breda to procure from Charles II. the establishment of that form of Church government in Scotland. The next Scottish parliament restored Episcopacy, and Sharp became Archbishop of St. Andrews. This and the part he took in the persecution of the Covenanters, roused the bitter hatred of his former friends, and he was murdered by a party of nine men on Magus Muir.

SHEBEEN, a term applied in Ireland and Scotland to an unlicensed house at which whisky may be bought.

SHECHEM, an ancient city of Palestine, situated in the centre of the country, on the slopes of Mount Gerizim. It is frequently mentioned in the Old Testament, and was for a time the capital of the Ten Tribes. In the New Testament it is referred to as Sychar (John iv. 5), and Sychem (Acts vii. 16).

SHECHINAH, the emblem of the Divine presence in the Tabernacle of the Jews and in Solomon's Temple. It rested on the mercy-seat as a bright cloud.

SHEFFIELD, on the river Don, near its junction with the Sheaf in Yorkshire, is the chief seat of the English cutlery trade, comprising every form of cutting tool. Its other manufactures include the conversion of iron into steel, the production of armour-plates, rails, etc., and the making of Britannia-metal and electro-plated goods. Mary, Queen of Scots, was confined in the castle (destroyed by order of Parliament in 1646) from 1570 to 1584. (For population, etc., see p. 902.)

SHEKEL, the standard of weight among the Jews, equivalent to about half-an-ounce avoirdupois. The name was also applied to a coin of gold or silver, or to a certain weight of money.

SHELDONIAN THEATRE, the Senate House of Oxford University, was designed by Sir Christopher Wren, and built at the expense of Gilbert Sheldon, archbishop of Canterbury. The Commemoration of Founders, when honorary degrees are conferred, is held here in June.

SHELL, a hollow projectile filled with a bursting charge of cordite or other explosive, and fitted with a time-fuse to explode it at a desired point, or with a percussion-fuse to explode it on impact. Since the introduction of rifling to the barrels of guns, shells, which were round previously, have been made of a conical shape. Common shells contain merely a bursting charge, and are employed against buildings, earthworks, etc. Shrapnell-shells are filled with bullets and a small bursting charge fired by means of a time-fuse. The bullets, after the bursting of the shell, fly onward in a shower, with the velocity acquired from the moving projectile. Shrapnell-shells are effective against bodies of troops.

SHELLEY, PERCY BYSSHE, *b.* in Sussex, 1792, *d.* 1822, a lyric poet, who was "possessed with a passion for reforming the world." Expelled from Oxford on account of his unorthodox views, which found expression in his pamphlet "The Necessity of Atheism," he spent the remainder of his life abroad, and was drowned by the upsetting of a boat in the Gulf of Leghorn. His greatest works are "Prometheus Unbound," a lyrical drama; "Adonais," an elegy on his friend Keats; and a tragedy, "Cenci," which showed that he might have become a great dramatist.

SHEPPARD, JACK, a criminal who made himself notorious in the early part of the 18th century, by his daring robberies and escapes from Newgate Prison. He was executed at Tyburn, 1724.

SHERBORNE, an ancient town in Dorset, formerly the seat of a bishopric founded by Ina in 705. Its noble minster contains the bones of the Saxon scholar Asser, and of two of the brothers of King Alfred. It has an excellent public school founded in 1550, and the boys took a prominent part in the interesting pageant held in 1905, to commemorate the 1200th anniversary of the foundation of the town and see.

SHERBROOKE, LORD (Robert Lowe), *b.* 1811, *d.* 1892; was educated at Winchester and Oxford. Here he became fellow and tutor of University College. He emigrated and established a large legal practice in Sydney and became a member of the Colonial parliament. On returning to England he gained a seat in the House of Commons, and as Vice-President of the Education Department he introduced the harmful system of "payment by results." He was subsequently Chancellor of the Exchequer and Home Secretary under Gladstone, and in 1880 he went to the Upper House as Viscount Sherbrooke.

SHERIDAN, RICHARD BRINSLEY, *b.* at Dublin, 1751, *d.* 1816, a dramatist and political orator. His most successful plays were "The Rivals," "The School for Scandal," and "The Critic." He entered parliament in 1780, and became under-secretary for foreign affairs two years later. His greatest parliamentary successes were his speeches impeaching Warren Hastings in 1787, and one in favour of the French Revolution in 1794. His last years were spent in abject poverty.

SHERIFF, the chief officer of the crown in every county. Three names for each county are submitted annually by a meeting of the judges and privy-councillors, and from these the crown selects the sheriff for the year. His duties are many. He is responsible for the defence of his shire against rebellion or foreign invasion, and, for this purpose, may call to his assistance all adult males. He sees to the collection of all crown revenues, executes the writs of the superior courts, attends the judges during the assize, and is responsible for the execution of criminals. Most of these functions are now performed by deputy, by the under-sheriff, bailiffs, and other assistants. In Scotland the sheriff is the chief judge of the county.

SHERIFFMUIR, a plain in Perthshire, a few miles north-east of Stirling, the scene of an indecisive battle between the Jacobite forces under the Earl of Mar and an inferior number of royalists commanded by the Duke of Argyle, 1715.

SHERRY, a Spanish wine of an amber colour produced in the neighbourhood of Xeres and largely exported from Cadiz. Perfection of flavour is said to be obtained only by keeping the wine in the wood for fifteen or twenty years. That intended for export is fortified with brandy.

SHERWOOD FOREST, formerly a royal forest, but now largely disafforested or occupied by gentlemen's seats and noble parks. Four railway lines converge on Mansfield in the centre of the old forest bounds, but numerous remains of the old forest still give reality to the legends of the outlaw Robin Hood. The forest, which lies between Nottingham and Worksop, is about 25 miles from north to south, and about 7 miles from east to west.

SHETLAND ISLANDS, a group of nearly 100 islands and rocks lying N.N.E. of the mainland of Scotland, and forming with the Orkneys a Scottish county. The largest islands are Mainland, Yell, and Unst. Fishing is the principal industry, but considerable numbers of cattle, sheep, and the well-known shaggy pony are raised. Lerwick is the capital; population of the whole group about 28,000.

SHIBBOLETH. When the Gileadites, under Jephthah, overcame the men of Ephraim they chose this word as a test at the ford of the Jordan. The Ephraimites being unable to pronounce the *sh* were thus detected and put to death (Judges xii. 6). The word is now used to denote a test of opinions peculiar to any party.

SHIELDS. See *Tyne.*

SHIITES. See *Sunnites.*

SHILLIBEER, GEORGE, *b.* 1797, *d.* 1866; the introducer of the modern omnibus, was for some time a midshipman in the Royal Navy. Then he learnt coachmaking in London and Paris, where he got the idea of the omnibus. Coming to London, he had two vehicles built to run from Paddington to the Bank. The first started in July, 1829. The idea became popular at once, but others gained more from it than Shillibeer, who finished his career as an undertaker.

SHILLING. Before the reign of Henry VII. the shilling represented a standard value in which the worth of property was reckoned, but without an equivalent coin. The name was also applied to a weight, viz., the twentieth part of a pound. The first coin bearing the name was struck in 1504. From that date the shilling has decreased in weight. At first a pound troy of silver produced forty shillings. Since the reign of George III., sixty-six have been coined from the same quantity. The coin is composed of an alloy of 925 parts silver to 75 copper.

SHINTOISM. Refer to *Index.*

SHIPS. From the year 1830, iron gradually superseded wood as the material of which ships are constructed, and more recently, steel has taken the place of iron. The great attention given to the study of the theory of stability has also led to many improvements in form and construction. Steam was first applied to navigation early in the 19th century. The *Clermont*, placed on the Hudson in 1807, and the *Comet*, which began to ply on the *Clyde* in 1812, were the pioneers of steam passenger ships. The *Sirius* and the *Great Western* crossed the Atlantic in 1838. These were all paddle-boats. The great advance that has been made may be seen in comparing the *Sirius*, a wooden ship of 450 tons, with such a magnificent ship as the *Baltic*, a steel vessel of 24,000 tons register, launched in November, 1903. In 1843 the *Great Britain* occupied nearly fifteen days in crossing the Atlantic. The *Campania* has reached Queenstown from New York in 5 days, 9 hours, 18 minutes. The most recent advance in steam navigation has been the introduction of turbine-engines. These are in use on several river-steamers and cross-channel boats, and are now found on ocean-going steamers. Two out of every five of the mercantile ships of the world still depend on their sails for propulsion. Of these the largest slightly exceeds 5,200 tons.

SHIP-MONEY, an impost first levied for the defence of the country against the Danes. In 1634 Charles I. imposed such a tax on London and the coast towns, and, in 1637, its incidence was extended to the inland towns. The refusal of John Hampden to pay the tax led to his trial before the High Court. By a majority of seven to five the judges decided in favour

of the king. The verdict was highly unpopular, and was a contributory cause of the Civil War. The impost was declared to be illegal by the Long Parliament in 1641.

SHIPTON, MOTHER, a mythical personage who was long reputed to have prophesied the invention of horseless carriages, the electric telegraph, etc. A book known as "Shipton's Prophecies" was first printed in 1687. In 1862 Charles Hindley introduced new matter into the book and republished it. Among other items he made the "prophetess" say "the world to an end shall come in 1881."

SHODDY, a worsted yarn produced by tearing into fibres old woollen garments, tailors' cuttings, etc., by means of sharp spikes fixed to rapidly revolving cylinders. A little fresh wool is added to the fibres thus prepared, and the whole spun into yarn, which is rewoven into the cheaper kinds of broadcloth, pilot-cloths, witneys, blankets, etc. Dewsbury and Batley in Yorkshire are the chief seats of the British shoddy trade. It is also extensively carried on in the United States and in Germany.

SHOEBURYNESS, a small town near Southend, in Essex. A sand bank extends for some miles along the Ness, and this is utilised by the government for artillery practice; population about 4,000.

SHORE, JANE, *b.* 1460, *d.* 1524, the wife of a London goldsmith, famed for her beauty and wit. She became the mistress of Edward IV., and afterwards of Lord Hastings. She was charged with sorcery by order of Richard III., and, that charge failing, was tried by the spiritual court on a charge of adultery, and condemned to do penance at St. Paul's. She is said to have died in a ditch now occupied by the district known as Shoreditch.

SHORTHAND is the name applied to various methods of writing words by means of signs which can be more rapidly written than the ordinary letters. The most popular method is that first published by Isaac Pitman in 1837. In Great Britain about 100 associations have been formed for the practice and the extension of the knowledge of the system. The sounds of the consonants are indicated by simple, geometrical lines, straight or curved, and of the vowels by a dot or dash. The same line represents a different sound as it is thin or thick, or written vertically or horizontally, or inclined at an angle of 45°. It is claimed for the system that the principles may be acquired in a few weeks by a student who devotes an hour a day to its practice. Additional speed in writing is obtained by abbreviations. Words of common occurrence are represented by the signs of one or two of its dominant letters. The expert writer is able to take down a verbatim report of the speeches of the most rapid speakers, who utter about 180 words per minute. For the purposes of reporting debates, taking down the evidence in law cases, and, in conjunction with the tpye-writer, in business, some form of shorthand has become absolutely indispensable.

SHORTHOUSE, JOSEPH HENRY, *b.* at Birmingham, 1834, *d.* 1903, an English manufacturer who also made his name as a novelist. His masterpiece, "John Inglesant," took him many years to write, and is considered to be one of the best historical novels ever written. His other novels, though interesting, are of less importance.

SHORT PARLIAMENT, the fourth parliament of Charles I., met in April, 1640, and was dissolved in less than three weeks, because the members insisted on discussing the grievances of the nation before voting supplies.

SHOT for filling cartridges for sporting purposes is composed of an alloy of lead and a small quantity of arsenic. The molten metal is dropped through various sized holes in a special vessel placed at the top of a shot-tower, the small, globular particles being permitted to fall into a tank of water at the base. The process is completed by polishing the shot in revolving boxes, containing a little plumbago. Case-shot or canister, is used in warfare to ward off a sudden attack. It consists of a cylindrical case of tin filled with bullets and made to fit the barrel of a gun. Cannon shot is made of iron or steel. Iron shot that is cast in cold iron moulds is extremely hard and possesses great penetrative power. Steel shot, however, is still more effective. Cannon shot, whether of iron or steel, has been to a large extent replaced by shell, on account of its greater destructive power.

SHOTTERY, a village in Warwickshire, about 1½ miles from Stratford-on-Avon, the birth-place of Ann Hathaway, Shakespeare's wife. The cottage in which she was born is a place of pilgrimage for visitors to Shakespeare's county.

SHOVEL, SIR CLOUDESLEY, *b.* at Cley, in Norfolk, 1650, *d.* 1707, entered the navy as a cabin-boy, and by his abilities raised himself to the command of a ship, and finally became an admiral. He was knighted for his share in the battle of Bantry Bay. He afterwards assisted in the victory of the Hague, commanded the expedition against Dunkirk, 1694, and took a prominent part in the battle of Malaga, 1704, and the capture of Barcelona, 1705. He was wrecked on the Scilly Islands when returning from an unsuccessful expedition against Toulon.

SHREWSBURY, the county town of Shropshire, stands on the river Severn. There are remains of the old city walls and of a Norman Castle. Its famous school was founded by Edward VI., 1551. Two parliaments have met at Shrewsbury, 1283 and 1397. The battle in which Henry IV. defeated Hotspur and Douglas was fought in the vicinity, 1403; population exceeds 28,000.

SHROVE-TUESDAY, the day preceding Ash Wednesday, received its name from the custom of all persons going to confession on that day. After being "shriven," they devoted the remainder of the day to feasting and jollity. A favourite dish was pan-cakes, from which circumstance the day was afterwards called "Pan-cake Tuesday."

SIAM, a kingdom occupying a portion of the Indo-Chinese peninsula, between Burma and Annam. The territory, which has dwindled in recent years owing to cessions to France, embraces the whole of the fertile basin of the Menam and a portion of the Mekong valley. The interior consists of dense forests and jungle. Gold, tin, rubies, and sapphires are mined. Considerable progress has been made in the last half century. Roads and railways have been constructed, and postal, telegraphic, and telephone systems have been introduced. Bangkok, population about 400,000, is the capital. The total population is estimated at six millions, and includes Siamese, Chinese, and Malays, with a fair sprinkling of European traders and government servants.

SIAMESE TWINS, *b.* in Siam, of Chinese parents, 1811, *d.* 1874. Their bodies were united by a fleshy band extending from breast-bone to breast-bone. Nevertheless their early life was that of the other children of the country, and they became expert fishers and swimmers. They were exhibited in Europe and America, gained a small fortune, and settled in the United States, where they married. They died within a few hours of each other.

SIBERIA occupies the whole of northern Asia, from the Ural Mountains to the Pacific Ocean, and has an area exceeding 4¾ million square miles. The country consists chiefly of an immense plain, sloping from the highlands of the south to the north and north-west, and drained by the Obi, Yenesei, Lena, and Amur. Mighty forests, which shelter the ermine, the sable, and other fur-bearing animals, extend along the rivers; there are pasture lands of enormous extent, and the soil of the southern steppes closely resembles that of the fertile "black lands" of the south-east of Russia. The mines produce gold, silver, copper, lead, zinc, and iron. The native population is composed of various Mongolian and Tartar tribes. Russians, consisting of political exiles and their descendants, and an increasing number of voluntary immigrants, form more than 80 per cent. of the people The completion of the Trans-Siberian Railway, the last section of which, that round the south of Lake Baikal, was opened in September, 1904, promises to open up the country in many ways. The chief towns are Tomsk, Irkutsk, Omsk, Tobolsk, Yakutsk, and Vladivostock.

SIBYL, a name applied by ancient writers to ten women in all, who were fabled to have received from the gods the gift of prophecy. Of these the most famous was the Sibyl of Cumæ. She is said to have written the Sibylline Books. These were a collection of prophecies written in Greek verse. Three of the books were purchased by Tarquin for the price for which the Sibyl had offered him the original nine. He twice refused to buy on account of the extortionate price demanded. Each refusal was followed by the burning of three of the books, and the offer of the remainder at the price demanded for the whole. The three were committed to the care of special priests, and, together with twelve other books that were added later, were consulted on all special occasions. They were burnt in the fire that consumed the temple of Jupiter, 83 B.C., but a new collection was made by a commission that visited various cities for the purpose. These were burnt in the reign of Nero.

SICILIAN VESPERS, a euphemistic name for a great massacre of the French in Sicily, where they had established themselves during the 13th century. The outrage began at the stroke of the vesper bell, in Palermo, on Easter Monday, 1282, and quickly spread to the other towns. Garibaldi attended the 600th anniversary of the event in 1882.

SICILY, the largest and most fertile of the islands of the Mediterranean, lies at the extreme south-western point of Italy, from which it is separated by the deep, narrow strait of Messina. The island is triangular in shape, mountainous in character, and it contains the well-known volcano Etna (which see). The soil is wonderfully rich, but the reckless destruction of forest lands is affecting both soil and climate. The island produces wheat, grapes, and oranges, but the methods of agriculture are primitive. Sulphur is the chief mineral product, and there are important sardine and tunny fisheries. Commerce is in the hands of foreigners, but it suffers from the badness of the roads. Education is defective, wages are low, and taxation high; hence a vindictive spirit still lingers among the peasants in the vendetta and maffia (which see). The population is about 3 millions: Palermo (270,000), Messina (150,000), and Catania (110,000) are the chief towns.

SIDDONS, SARAH, *b.* at Brecon, 175 *d.* 1831; the daughter of a provincial theatre-manager; made her *debut* as a tragic actress before a London audience at Drury Lane, in Garrick's company. She afterwards joined her brother, John Philip Kemble, at Covent Garden. It is probable that no tragedienne has surpassed Mrs. Siddons in the complete mastery she displayed in every department of her art.

SIDGWICK, HENRY, *b.* at Skipton, 1838, *d.* 1900; an eminent professor of mental and moral science, on which his writings are particularly valuable. But his name will go down to posterity as the champion of women's education. He had the largest share in the foundation of Newnham, and no small share in founding Girton. His best known works are: "Methods of Ethics" and "Principles of Political Economy."

SIDNEY, ALGERNON, *b.* 1622, executed 1683; a grand-nephew of Sir Philip Sidney. He joined the Parliamentarians, was wounded at Marston Moor, and held various appointments of importance under the Commonwealth. He resided in France for the first years of the Restoration, but was induced to return on a free pardon by Charles II. He was subsequently suspected of political intrigues with France, and after the Rye House Plot was executed along with Russell, Essex, and Howard, after a nominal trial by Jeffreys. Sidney drew up for William Penn the constitution of Pennsylvania, and amongst its provisions were the ballot, universal suffrage, and the abolition of capital punishment, save for murder and treason.

SIDNEY, SIR PHILIP, *b.* 1554, *d.* 1586, a nephew of Queen Elizabeth's favourite, the Earl of Leicester, was a refined, cultured, and chivalrous gentleman, whose life reflected both the ardour of mediæval knighthood and the generous refinement of the renaissance. He was the friend of the poet Spenser, and himself was a true poet, as his sonnets bear witness. His "Astrophel and Stella" is a poetical account of his fruitless love for Penelope Devereux, and like all his writings, it finds an added charm in its close relation to the poet's own life. He was mortally wounded in the attack on Zutphen in the Netherlands, and his last chivalrous act of giving to a wounded man his own draught of water represents truly the beauty of his character.

SIDON, an ancient sea port town of Phœnicia on the eastern coast of the Mediterranean. In classical times it was famous for its royal purple dyes, its glass, and its fine linen. It declined in importance after the fall of Rome and the rise of Mohammedanism, but its former commercial greatness may be gathered from its frequent mention in Old Testament history along with its sister city of Tyre.

SIEMENS, SIR WILLIAM, *b.* in Germany, 1823, *d.* 1883; became a British subject in 1859, and acted as manager of the firm of Siemens Brothers, superintending himself the construction of marine and overland telegraphs. His own researches in metallurgy led to the application of his discoveries to the manufacture of steel. He superintended the construction of the Portrush Electric Tramway, thus first utilising electricity for locomotion in these islands. His attention was by no means confined to electrical and metallurgical research, for among his other inventions are a water meter, a bathometer for taking ocean depths, and a process for electro-gilding, also a cheap method of gas manufacture for heating purposes, such as glass melting.

SIERRA LEONE, one of the four British Colonies in West Africa, was ceded to Great Britain in 1787 as an asylum for the negroes whom the liberation movement had left destitute in various parts of the British dominions. Its capital, Freetown, has the best harbour of West Africa, and is the seat of government. Many languages are spoken owing to the manner of colonization. The inhabitants are engaged chiefly as intermediaries between the British merchants and the natives of the interior. Palm-kernels and kola nuts are the chief exports. In 1896 a British protectorate was proclaimed over the tribal territories between Sierra Leone and French Guinea.

SIERRA NEVADA, or **SNOWY MOUNTAINS,** is the Spanish name applied to several lofty ranges in Spain and America. (1) In Granada, the Sierra Nevada is a range running east and west close to the Mediterranean shore, and containing Mulhacen (11,670 ft.), the highest peak of Spain. (2) The Sierra Nevada of California runs north and south behind San Francisco for 450 miles. Mount Whitney (15,000) is its chief peak, and the quartz formations yield the gold for which California is famous.

SIGNALLING is the process of conveying information by sight or sound to a distant observer. An international code of signals has been adopted by the chief maritime nations for use at sea. It was devised by Captain Marryat, the novelist. The code is based on the use of flags arranged under one another. Semaphore signals, consisting of combinations and arrangements of the positions of two arms under one another are suitable for use either on sea or land. Vessels are bound to indicate their movements during fog or snow by sounding bells or sirens to prevent collisions. The Morse system of signalling by long and short flashes of light is used in the Navy during the night, with a secret code. The Morse system, which is practically the "dot and dash" system of ordinary telegraphy, is adapted for military purposes, certain movements of a flag denoting a "dot" and others a "dash."

SIGNET, THE, was one of the seals formerly required to give validity to a royal grant. A warrant first received the signet seal, then the privy seal, and finally the great seal. The class of solicitors in Scotland known as "Writers to the Signet," are so named because they were formerly employed in the royal service to prepare warrants and grants.

SIGN-MANUAL, THE ROYAL, is the signature of the sovereign applied to all documents before they are sealed with the privy or the great seal.

SIKHS, THE, originally a religious sect founded in the 15th century in the Punjab, near Amritsar, which has since been the headquarters of their religion. During the 18th century they organised themselves as a military power, and ultimately possessed an army of 120,000 men trained to arms by European methods under French officers. In 1845 they broke their treaty with the British by crossing the river Sutlej. Sir Hugh Gough defeated them at Mudki, and stormed their camp at Firozeshah in company with Sir Henry Hardinge. Sir Henry Smith defeated a second force of Sikhs at Aliwal, and Gough and Hardinge finally routed them at Sobraon. In the treaty signed at Lahore, much of the Punjab, as well as Cashmere and some of the hill country, were ceded to Britain. War broke out again in 1848, when, after the indecisive battle of Chillianwalla, Gough effectually crushed the Sikhs at Gujerat. The Punjab was annexed, and so completely did the Sikhs settle down under British rule, that in the Indian Mutiny a few years later they rendered great service in its suppression.

SIKKIM, a small Himalayan province of India under native rule and British protection. Darjeeling, on the British side of the southern border of Sikkim, was ceded to Britain by the Rajah of Sikkim in 1835, and is the terminus of the railway from Calcutta.

SILAGE. See *Ensilage.*

SILCHESTER, a Hampshire village 9 miles north of Basingstoke. Its chief interest lies in the ruins of the old Roman-British town of Calleva. The walls and the lines of the streets are easily traced, and many household and decorative articles have been found, as pottery, coins, and tools.

SILESIA, the most southerly of the provinces of Prussia, lies on the north side of the Carpathian Mountains, and is traversed from south-east to north-west by the Oder. Coal is plentiful in the south-east, and zinc and lead are abundant. Sheep-rearing is carried on extensively, but nearly half the population are engaged in industrial pursuits. Breslau, the capital, has a university, and its trade in grain and wool is very great; population about 4,200,000.

SILHOUETTE, an outline drawing of a profile, filled in with a black or dark colour. The copy may be made by following the outline of a shadow from a single light, or may be cut direct with scissors by a skilful person. The name is derived from Etienne de Silhouette, a French minister of finance, in 1759, whose schemes were so unsuccessful and short sighted that the phrase *à la Silhouette* came to denote cheapness and triviality.

SILK. The cultivation of the silk-worm and the manufacture of silk from the fine thread of which its cocoon is formed was practised in China for many centuries before the Christian Era. During the reign of Justinian (550 A.D.) two Persian monks brought from China to Constantinople a number of eggs secreted in a hollow cane. They had watched the operations of silk making in the East, and were able to superintend the first silk weaving industry in Constantinople, and so to introduce it into the West. The silk-worm thrives best on the leaves of the white mulberry, a tree which does not suffer to any great extent from the loss of its leaves. These are plucked and placed in boxes for the worms. After some of the cocoons have been selected for hatching, the rest are slightly roasted to destroy the worm. They are then washed, and the ends of the threads of several cocoons are picked up by a brush and twisted into *raw silk.* The thread is joined up to other lengths, the natural gumminess providing a sufficient junction, and then wound on a circular frame. The fibre is passed through fine apertures to clean it and make it uniform in thickness. It is now ready for use, but its stoutness is often increased at this stage by doubling. There is necessarily much waste silk, and this is now utilised to form silk yarn and fancy threads. About 40 per cent. of the whole supply of raw silk comes from China, and 30 per cent. from Italy. France is the greatest silk manufacturing country, but the industry is carried on extensively in the English Midlands. Leek, Staffordshire, is famous for its silk dyeing, and especially for its peculiarly glossy, black silks.

SILK-COTTON, a silky fibre obtained from the seed-pods of the Bombax and other allied trees. It is too short and soft to be spun into yarn, but its elasticity makes it eminently suitable for stuffing pillows, etc., for which it is largely used in Holland.

SILVER, one of the precious metals, is obtained chiefly from ores which also con-

tain lead. In this form rich deposits are found in the Western States of North America, yielding an annual output of over twelve millions sterling. The ores of Mexico, which yield almost as much silver as those of the U.S., are a sulphide of silver known as argentite. Norway, Saxony, and Austria produce over two millions annually, and an equal amount is obtained from Australian and Tasmanian ores. In all cases the process of separation is commenced by beating the ore into a fine mud from which the metal is taken up by various chemical processes. The rapid increase in the output of American mines during the last 25 years has lowered the price of silver, the value of an ounce falling from 3s. in 1893 to 2s. in 1902. An alloy of silver and copper, consisting of thirty-seven parts of silver to three of copper, is employed for the British coinage, and the same standard is used for hall-marked silver. Silver does not perish by exposure to the pure atmosphere, but it tarnishes readily owing to the existence of sulphur in the smoke that taints the air of a house.

SIMEON, CHARLES, *b.* 1759, *d.* 1836; a devoted Evangelical minister and eminent preacher. Educated at Cambridge, he was made a Fellow of King's College in 1782, and in the year following presented to the living of Trinity Church, Cambridge, which he held till his death. But his influence spread all over England, and he took a leading part in founding the Church Missionary Society. His published sermons, which number more than 2000, had immense influence.

SIMEON STYLI'TES, *d.* 459 A.D., an ascetic Syrian monk who for thirty years lived on a pillar (*Gr. stylos*) near Antioch, practising rigid austerities and preaching during the day to the crowds whom his fame attracted. (See *Pillar Saints.*)

SIMILE, a figure of speech in which a description is made vivid by the introduction of a comparison or resemblance; e.g.

"And every soul, it passed me by,
Like the whizz of my cross-bow."

SIMLA, a station on the southern slope of the Himalayas, 170 miles north of Delhi, which forms the head-quarters of the Indian Government in the hot season. It stands 7000 feet above the sea, amid magnificent forests of oak and cypress.

SIMNEL, LAMBERT, was a youth who was trained to impersonate the young Earl of Warwick, a Yorkist claimant of the English throne in the reign of Henry VII. Simnel was captured, and made a scullion in the royal kitchen, the true Earl being shown publicly to the people of London.

SIMON MAGUS, or **SIMON THE SORCERER,** had a considerable reputation as a magician in Samaria during the early days of the Christian Church. When the apostles visited Samaria to confirm the converts of Philip, Simon endeavoured by bribery to persuade them to confer special gifts of miraculous power upon him, a request which drew down the condemnation of St. Peter. Hence the crime of buying and selling spiritual offices or benefices for profit is called *Simony.*

SIMOOM, the general name of all those suffocating winds that blow outward from the Sahara. In West Africa it is known as the *harmattan,* in Algeria and Morocco as the *shume,* and on crossing over to Spain it becomes the *solano,* while in Egypt it takes the name *khamsin,* "fifty," because it usually blows at intervals during fifty days, from April to June. The wind is charged with small dust and causes much ophthalmia, especially in Tunis, where it goes by the name of *sheely.* In Italy the same wind is known as the *sirocco,* but in its passage across the Mediterranean it becomes damp, whilst retaining its heat and fine dust.

SIMPLON, a much used pass from Switzerland to Italy, made famous by the remarkable road constructed over it (1800-6) by Napoleon. By cutting, tunnelling, and buttressing, the extreme gradient was reduced to 1 in 13. A railway tunnel, 12 miles in length, was opened, February, 1905, after the occurrence of hot springs in the boring had caused (November, 1904,) a temporary cessation of operations.

SIMPSON, SIR JAMES, *b.* at Bathgate, 1811, *d.* 1870, the son of a baker, entered the university of Edinburgh as a medical student and took his M.D. at the age of twenty-one. He was appointed to the chair of Midwifery in 1840, and in this position greatly advanced the scientific treatment of obstetric cases. His most remarkable contribution to the advancement of medical practice was his discovery of the value of *chloroform* as an anæsthetic.

SIMS, GEORGE ROBERT, *b.* in London, 1847, one of the most popular playwriters and journalists of the day; found it a hard task to get a start in journalism, being hampered by a lucrative position in the City. His contributions to the *Referee,* under the name of "Dagonet," are well known. Among his plays are "Crutch and Toothpick," "The Lights of London," "In the Ranks."

SIN, is that in man which estranges him from, or puts him at enmity with God. Hence arises the Christian idea of the necessity of a Redeemer who saves man from the guilt and power of sin. *Original sin* is defined as the corruption of man's nature so that his will inclines naturally towards evil from his birth. Christian Baptism is a sacramental regeneration or new-birth from this state of original sin, to a state of grace. The Catholic practice of Confession led to the development of a minute classification of sins into sins of omission and of commission, voluntary and involuntary sins, sins of infirmity, mortal, and venial sins; and mediæval literature contains frequent allusions to the seven deadly sins, as in the procession of the seven sins in Spenser's Faery Queene, Book I., Canto IV., where pride, vanity, idleness, gluttony, avarice, envy, and wrath are portrayed. In so far as all religions appear to seek modes of averting the wrath of a higher power, either by sacrifice or by mysterious rites, it may be said that some idea of sin enters into all religions.

SINAI, is a peak in the mountainous peninsula of Sinai which lies between the two gulfs that form the northern extremity of the Red Sea. There are three peaks of over 6,000 feet in height, and each is claimed as the mountain on which the law was delivered to Moses. Tradition has fixed on Mount Catherine (Jebel Musa), however, at whose foot stands the monastery of St. Catherine, and at whose summit is a little pilgrim church. The many caves in this district were formerly the abode of anchorites or hermits.

SIND or **SCINDE,** a province of India within the Presidency of Bombay, occupying the flat country about the lower course of the Indus. A belt of fertile land borders the river, whose floods so enrich it that it produces two harvests annually. To the east stretches the Thur, a desert of moving sand. The capital is Karachi, a sea-port, which the government harbour works have done much to improve. The Indus Valley Railway from Karachi has developed the commercial value of the province.

SIN-EATERS, men who attended funerals for the purpose of eating a piece of bread and drinking a cup of ale that was placed on the bier. They then declared that they had, by this action, taken upon themselves the sins of the deceased, who would not, therefore, be compelled to walk the earth as a ghost. The custom was once common in the counties bordering on Wales.

SINECURE, an office without responsibilities but yielding revenue. A benefice or living without any cure of souls is known in Ecclesiastical Law as a sinecure, but sinecure rectories were abolished during the first half of the 19th century. Government sinecure offices were formerly numerous, and one, the "Chiltern Hundreds," still exists. By accepting their nominal stewardship a member of Parliament is able to vacate his seat. (See *Chiltern Hundreds.*)

SINGAPORE. Refer to *Index.*

SINON, in Greek legend, a cousin of Odysseus, whom he accompanied to Troy. Having permitted himself to be taken prisoner, he persuaded the Trojans to admit the wooden horse, full of Greek warriors, into the citadel. His name is proverbial for a treacherous deserter from the enemy.

SIPHON, a bent tube having one arm shorter than the other, used for drawing off liquid from one vessel into another. The tube is filled with liquid, the short arm is placed in the vessel to be emptied, and a flow of liquid immediately ensues. If the two arms were of the same length the pressure of the atmosphere at the two ends of the tube would not only be equal, but have the same effect. But the arms being unequal in length, the pressure of the atmosphere at the end of the long arm has to support a longer column of liquid than that at the bend of the shorter arm. Hence the pressure available for keeping the liquid in the long arm is less than that available for pushing the liquid up the short arm and down the long one.

SIR, with the Christian name and surname is now only used in speaking of knights and baronets. It is a contraction of the French "seigneur" (L. *senior*), and was formerly much used in speaking of or to clergymen. "Sire," an older form, was exclusively reserved for addressing royalty, but is now obsolete.

SIRDAR, a word signifying "chief," used in Mohammedan countries for a commander-in-chief, and hence used to designate the British officer in command of the Egyptian army.

SIREN, an instrument which produces a musical note by checking and liberating alternately a strong current of air through a nozzle, by a revolving disc pierced with holes. As each hole passes the nozzle, the air is liberated and then shut off until the next hole passes. In most sirens the blast causes the revolution of the disc, and the height of the note increases with the power of the blast. Hence the value of the instrument in determining the vibration number of each note.

SIRENS, THE, sea-nymphs who sang so alluringly as to entice to destruction all sailors who drew near their island off the south-west point of Italy. Ulysses escaped their enticement by stopping the ears of his men with wax and lashing himself to the mast. Orpheus, with his lute, provided a more winning spell for the Argonauts whom he accompanied in their quest of the Golden Fleece, and the Sirens, chagrined at this defeat, cast themselves into the sea and were turned into rocks.

SIROCCO or **SCIROCCO,** a scorching wind from the African deserts, that blows

over the northern coasts of Africa, and is experienced at certain seasons in Italy, Sicily, and Malta.

SISERA, the "captain of the host" of Jabin, king of Canaan, from whose oppressions Israel was delivered by Deborah and Barak. Sisera was treacherously slain by Jael, a Kenite woman, while asleep in her tent after his escape from the battle. (Judges iv. and v.).

SISTER DORA. See *Pattison, Dorothy.*

SISTINE CHAPEL, THE, one of the most famous of the chapels of the Vatican, was built by Pope Sixtus IV. in 1473, and its walls were adorned by Michael Angelo, who was assisted by other Florentine painters. His work on the ceiling of the chapel is beyond description; numberless groups and subjects, each a masterpiece in itself, display the genius of their author in the treatment of human subjects taken from scriptural or classical sources.

SISYPHUS, in classical mythology, is said to have been cruel to travellers and to have angered Jove. In the nether world he was doomed to perform the endless task of rolling up a hill a heavy stone, which as soon as it reached the top always rolled down again.

SIVA, or **SHIVA,** a Hindu deity who was originally regarded in Hinduism as the Destroyer, but to whom in the popular Hinduism of to-day is ascribed creation and reproduction as well as destruction. (See *Brahma.*)

SIX ARTICLES, THE, a statute passed in the reign of Henry VIII., 1539, to secure uniformity of doctrine in the English Church. The statute was an arbitrary measure of the king's, and was intended to show his dislike of certain Lutheran doctrines. The six articles insisted upon were (1) Transubstantiation, (2) the withholding of the Chalice from the laity, (3) the celibacy of priests, (4) the sanctity of religious vows, (5) the necessity of auricular confession, (6) the maintenance of private masses.

SIZAR, "a scholar of a college in Cambridge who pays lower fees than a *pensioner* or ordinary student" (Skeat). Formerly, sizars performed certain menial offices, such as waiting upon the Fellows at table; but such duties are no longer exacted from them.

SKALD, an old Norse name for a poet. Fragments of Skaldic poetry are preserved in the sagas, and they treat chiefly of the heroic deeds of the chieftains whose patronage they enjoyed.

SKEAT, WALTER WILLIAM, *b.* 1858, had a brilliant career as a mathematician before he gave himself up to the study of Early English. He was the first to hold the post of Professor of Anglo-Saxon at Cambridge. His works on Early English are of great value. He has done much to popularise his favourite study.

SKERRYVORE, the most prominent part of a reef lying about 24 miles west of Iona. Previous to 1844 few years had passed without one wreck at least on this reef, which is about 8 miles long. In 1844 a lighthouse, 140 feet high, begun in 1838, was finished by Alan Stevenson, and now sends its light a distance of 20 miles over the sea.

SKUNK, a small carnivorous quadruped of the size of a rabbit, found chiefly in the fur-hunting districts of Canada. It is valuable because of its fur, which is of a glossy black with lines of white. The skunk protects itself from attack by the sudden emission of a most foul-smelling fluid secreted in its anal glands, the effect of which is disagreeable even at a distance of several hundred yards.

SKYE, the largest island of the Inner Hebrides, is separated from Inverness-shire by a narrow and tortuous channel, Loch Coruisk, gloomy and impressive, and Glen Sligachan, the grandest of Scottish glens, are well-known to tourists in Skye. The islanders are poor and win their livelihood from the sea, or in sheep-farming. Portree, on the east, the chief village, is a place of call for the West Coast Steamers.

SLANG, is the name given to the use of words which are not to be found in a standard dictionary. Almost all professions, trades, and classes use slang terms, and when these become sufficiently familiar to society in general, they tend to become standardised and are ultimately stamped with the mark of approval by inclusion in a dictionary. Some knowledge of Stock Exchange slang is necessary to understand a financial newspaper. Kipling's best stories abound in military, engineering, and naval slang. Gipsy dialects, Yiddish, and the slang of vagabonds and thieves are a source of expressive terms. The most prolific source of slang, however, is America, where the smartness and bustle of the Yankee finds expression in the extravagant use he makes of exaggerations and striking terms.

SLATE, is a form of clay, just as marble is a form of chalk. It is highly fissile, and may often be cleft into "slates" of quite delicate thinness. The North Wales quarries yield the well-known blue slate used for roofing, and the Cumberland green slate is much sought after for its pleasing colour, although it is coarser and more expensive than the Welsh slate. A considerable supply of cheap roofing slate comes from America. School slates are made of Welsh slate, which is also largely used for clock cases, and mantel-pieces. For this latter purpose it is polished to resemble marble.

SLATE CLUB, a benefit club formed annually for support in sickness and for providing a "lump sum" at Christmas. Its name is due to the fact that each year ends, as it were, with a clean slate; for the funds in hand at the end of the year are "shared out" among the members, and the club ceases to exist.

SLAVERY. See *Abolition of Slavery.*

SLAVS, a branch of the Indo-European or Aryan family of people, like the Teutons, the Celts, and the Roman nations. They occupy the eastern part of Europe under the national names of Russians, Poles, Bohemians or Czechs, Serbs and Bulgarians. Their languages are more highly inflected than the kindred ones of the Teutons and the Latin races, and show less variation from the original Aryan language. It is estimated that there are about 100,000,000 Slavs in Europe.

SLEEP and **SLEEPING SICKNESS.** See *Med. Dict.*

SLOANE, SIR HANS, *b.* in Ulster 1660, *d.* in Chelsea 1753; was a great student of natural history and an eminent doctor. He succeeded Sir Isaac Newton as President of the Royal Society, and his museum and library formed the nucleus for the commencement of the British Museum. His herbarium is now exhibited at the Natural History Museum, and the Botanical Gardens which he gave to the Society of Apothecaries are still to be seen on the Chelsea Embankment. A monument to his memory is a prominent feature in the enclosure of Chelsea old church.

SLOTH, a tree-dwelling animal, native to Central America, which seldom comes to the ground, but lives entirely on the vegetation afforded by the trees. Its legs and claws are long, and it hangs on the branches in a suspended posture, its body being underneath. Its greenish colour, due to a lichen parasitic on its fur enables it to escape detection among the foliage of the trees, and its name significantly denotes its inactive disposition.

SLOYD, is a Swedish name for a system of wood-work followed in the schools of Sweden and Finland and now used with various modifications in very many schools in the towns of Great Britain. Besides the practical value of a knowledge of the use of tools, of the nature and uses of various kinds of timber, and of methods of construction, there is in Sloyd the educational value of manual work duly graded. This value lies in the development of the active constructional instincts of the boy, which lie dormant in the old fashioned "bookish" system that contented itself with schooling him in the three R's. The Swedish word *sloyd* is cognate with the English *sleight*, and denotes "sleight" or dexterity of hand.

SLUYS, a town by the sea in the south of Holland, near which was fought a famous sea-fight in 1340, when the English defeated the French.

SMEATON, JOHN, *b.* 1724, near Leeds, *d.* 1792, a great engineer, whose name is rendered famous by the Eddystone Lighthouse, which he built in 1756-9, and which stood for 120 years, until it was removed because its rock foundations were being undermined. Among Smeaton's other works were Ramsgate harbour, the Coldstream bridge over the Tweed, and the Forth and Clyde Canal. He was an authority on the machinery of mills and on engines, and was a Fellow of the Royal Society.

SMILES, SAMUEL, *b.* 1812 at Haddington, *d.* 1904, was educated as a medical practitioner, but, taking to literature, he became editor of a Leeds newspaper. Subsequently he was appointed secretary of a Yorkshire railway company, and in 1854 became secretary of the South Eastern Railway. Having formed a friendship with George Stephenson in Yorkshire, he undertook to write his life. Encouraged by his success he wrote his famous "Self Help," and followed this up by a large number of interesting biographical works on the lives of engineers and men of mark in the industrial world. All these works are written to illustrate the worth of self-education, integrity, and perseverance.

SMITH, ADAM, *b.* at Kirkcaldy, 1723, *d.* 1790, the famous author of "The Wealth of Nations," established by this work the treatment of political economy as a separate branch of knowledge. He was educated at Glasgow University, and Balliol College, Oxford, and as a travelling tutor to the Duke of Buccleuch he joined in the intellectual life of Paris. His book is a fearless exposition of the economic soundness of Free Trade. It contained too much destructive criticism to be a systematic treatise on political economy, but, when the stress of the Napoleonic Wars had passed, it found numberless admirers and did a great deal towards forming the body of opinion that established Free Trade in this country.

SMITH, CAPTAIN JOHN, *b.* in Lincolnshire, 1580, *d.* 1631, an adventurer, student, and writer, who served in the Low Countries, fought as a pirate in the Mediterranean, escaped from slavery in Turkey, and fought against the Spaniards at sea. In 1605 he joined an expedition to Virginia and helped to found Jamestown. He was saved from Indian treachery by Pocahontas, an Indian princess, and became president of the colony. His literary works are autobiographical, and are extremely interesting.

SMITH, GEORGE, *b.* in London, 1840, *d.* 1876; a great authority on Assyrian antiquities. He began life as an engraver,

but the extent of his studies and knowledge gained him a post at the British Museum. He did a great deal both in excavating Assyrian ruins and in deciphering the inscriptions there found, including the Chaldæan account of the Deluge.

SMITH, JAMES AND HORACE. See *Rejected Addresses.*

SMITH, JOSEPH. See *Mormons.*

SMITH, SYDNEY, *b.* 1771, *d.* 1845, is now chiefly remembered as a wit, but was in his day also a great advocate of social reforms. Educated at Winchester and Oxford, he resided afterwards in Edinburgh for six years, and was one of the founders of the *Edinburgh Review.* For twenty years he was rector of the small Yorkshire parish of Foston, and here he wrote and worked in comparative seclusion. Subsequently he became a canon of St. Paul's Cathedral, and he took at once a prominent position among the literary men of "the town" as a lecturer, conversationalist, and occasional writer.

SMITH, THE RIGHT HON. W. H., *b.* in London, 1825, *d.* 1891; was educated at Tavistock School, and in time took his share in the flourishing business (of W. H. Smith & Sons) founded by his father in 1792. To success in business he added success in politics, becoming a Cabinet Minister nine years after entering Parliament. He was made First Lord of the Admiralty in 1877, and leader of the House of Commons in 1887, a position he held till his death.

SMITH, WILLIAM, *b.* in Oxfordshire, 1769, *d.* 1839, one of the originators of the modern science of Geology in England, and the author of the first Geological Map of England. He was a surveyor and engineer, and took up the study of geology as a hobby.

SMITH, WILLIAM ROBERTSON, *b.* in Scotland in 1846, *d.* 1894, a great orientalist and Old Testament critic, was educated at Aberdeen, and elected to the chair of Hebrew at the Free Church College in that city. His article on "Bible" in the *Ency. Brit.* provoked great alarm among the Free Church Assembly, and he was put on trial for heresy, but acquitted. Subsequently he was removed from his chair because of a somewhat daring article on the "Hebrew Language." He then joined Prof. Baynes as joint editor of the *Ency. Brit.*, and after his colleague's death took the editorship alone. He held the Adam's professorship of Arabic at Cambridge from 1889 until his death.

SMITH, SIR WILLIAM SIDNEY, *b.* 1764, *d.* 1840, gained a commission in the navy for bravery at the battle of Cape St. Vincent in 1780, and rose rapidly in the service. He was one of the most active commanders all through the Napoleonic Wars, but his duties lay chiefly in the Eastern Mediterranean. In 1799 he captured the French ships co-operating in Napoleon's attack on Acre, and then threw himself into the town, which he defended so effectively that Napoleon raised the siege and abandoned his guns.

SMITHFIELD, originally an open field outside the walls of London, used for games, tilts, and fairs. Here in the reign of Henry I. the Hospital and Church of St. Bartholomew were founded, both of which exist, the former as one of the leading modern hospitals, the latter, the most beautiful Norman building in London. In 1305 Wallace, the Scottish patriot, was beheaded here, and many Protestants and Roman Catholics were burned at the stake in the Tudor days, before the place of execution was established at Tyburn. At Smithfield are now established the London Central Meat Market and the Poultry and Provision Market. The meat and provisions are brought by an elaborate system of underground railways from the various main line goods stations.

SMOLLETT, TOBIAS GEORGE, *b.* in Dumbartonshire, 1721, *d.* 1771, a novelist and historian, the author of part of Hume and Smollett's History of England, (Smollett was responsible for the years 1689-1760), and of the three well known novels, "Roderick Random," "Peregrine Pickle," and "Humphrey Clinker." The novels are suggestive of his own experiences. He was of good birth, and well educated, but he was dangerously addicted to bitter sarcasm, and was of that uncertain temperament which has kept so many literary geniuses on the brink of poverty.

SMUGGLING is the act of defrauding the State by evading the recognised custom duties. Smuggling is, of course, most prevalent when the duties are high. In the 18th and early part of the 19th century smuggling was rife, and the smuggler was often regarded as a popular hero if not a public benefactor. With the establishment of Free Trade smuggling almost ceased to be practised, tobacco being almost the only article worth the risks.

SMYRNA, the chief port of Asia Minor, is situated at the head of a gulf of the same name, which forms an arm of the Ægean Sea. The town is built on an amphitheatre of hills rising from the head of the Gulf. It is partly Turkish and partly European, but neither part of the town is cleanly. Two railways run into the interior, and bring to Smyrna the agricultural products and fruits of the inland districts. It is also an important depôt for Turkey carpets. Smyrna is the seat of a Roman, Greek, and American Archbishopric, and also the head quarters of a Turkish provincial governor; population about 200,000.

SNAKES, a class of reptiles akin to the lizard, found in most continental and tropical areas, but seldom in quite isolated islands. The Pythons of India, and the Boas and Tree-snakes of Central America are tropical snakes, unusually large, but not venomous. The Cobra, the Indian Sea-snake, the American Rattle-snake, and the English Viper are venomous snakes, which, though not large, are distinctly dangerous. Snakes swallow their prey whole, and digest it in a state of dormancy; they frequently cast their "slough," or scaly skin, and it is said that they depend on their sense of smell more than on that of sight or hearing, both of which are dull. The fangs of venomous snakes are a pair of sharp teeth in the upper jaw, communicating by ducts with poison glands behind the eyes. The lidless eyes of the snake have led to the idea that snakes fascinate their prey, but, on the other hand, the snake-charmers of the East appear to possess the power of influencing these reptiles by music and motion. Deaths from snake bite in India occur as frequently as 1 in 10,000 of the population annually. The effect of the bite is a paralysis of the nerve centres, and the best immediate treatment is sucking, tight binding, and often cauterizing or amputation of the affected limb. The mongoose, a small, Indian quadruped, and the secretary-bird of South Africa are the natural enemies of these reptiles, which they fearlessly attack, however venomous they may be.

SNEEZE-WOOD, the wood of a large and useful tree found in Cape Colony. It grows to a height of over 100 feet, and the wood is very hard and durable, being proof against both the white ant and the ship-worm. The sawdust from it is very irritating to the nasal passages—hence its name.

SNOW is not frozen rain, like hail or sleet, but is the effect of frost upon the water-vapour in the atmosphere. The well-known hexagonal crystalline flowers of snow are the forms assumed by the frozen moisture which crystallizes around the nuclei of dust present in the air. The snow-fall in Great Britain is slight in comparison with that of continental areas of the same latitude, a fact which is due to the influence of the warm waters of the Atlantic. Snow-drifts in sheltered cuttings sometimes impede railway traffic, however, and the snow-plough is familiar in country districts. The perpetual existence of snow above the altitude of the "snow-line" of mountains is the cause of glaciers, and the origin of most of the great rivers of the world.

SNOWDON, a conspicuous mountain in North Wales 3,560 ft. in height. Its ascent is rendered easy by a railway, but the crags on the south-east, and the notable edge of Grib Goch, afford difficulties sufficient for the most daring mountaineer.

SNOW-SHOES are flat frames covered with a close network of hide, and fixed to the foot to prevent the wearer from sinking into the snow. They admit of a rapid skating motion, and are found extremely useful on the snow-covered prairies of Canada.

SNYDERS, FRANZ, *b.* at Antwerp, 1579, *d.* 1657, a Flemish painter of still life and animals. His representations of animals fighting are remarkable for their life and vigour.

SOANE, SIR JOHN, *b.* at Reading, 1753, *d.* 1837; the leading architect of his time; received his training at the Royal Academy, and afterwards travelled abroad to study. He held many public appointments, such as architect to the Bank of England, the Department of Woods and Forests, etc., and he designed many country mansions. He bequeathed his house in Lincoln's Inn Fields, London, and the art treasures therein to the nation. These form the "Soane Museum."

SOAP is produced from fats by the action of alkalis (potash or soda). Fat is melted in a copper with the alkaline soda, the addition of salt afterwards leads to the separation of the water from the soap, and then the by-product *glycerine* is removed along with the spent alkali. A fresh boiling of the soap with new "lye" (soda) completes the process, and leaves the soap ready for subsequent treatment as curd, mottled, or transparent, according to the kind required. Soaps made from soda, as here described, are known as "hard soaps," those made from potash are "soft soaps."

SOBIESKI, JOHN, *b.* 1624, *d.* 1696; the hero-king of Poland, saved his country first from the Cossacks and Tartars, and afterwards from the Turks. He was elected King in 1674, and in 1683 gained a celebrated victory over 100,000 Turks who were besieging Vienna. His strenuous efforts to reform his country were frustrated by the nobles.

SOCIALISM is at present a body of idealistic theories which aim at correcting the evils of the existing system of industrial competition under companies of capitalists. Capitalists served by wage-earners are to be replaced by associations of workmen, who co-operatively act as a common body of employers and employed. A man would thus serve the body corporate of which he was a member instead of being the employé of a capitalist whose gains are got from the work he procures from his paid workmen. The success of such co-operation would depend on the character of the workers.

SOCIETY OF FRIENDS. See *Quakers.*

SOCINIANS, those who hold the opinions taught by Lælius and Faustus Socinus, uncle and nephew, two Italian theologians who lived in the 16th century. They regarded our Lord as divinely endowed, but denied His divinity, and maintained that human reason was the criterion of the truth of religious dogma. Socinianism is now represented by Unitarianism and Rationalism. Both uncle and nephew were men of unblemished character, but they had to endure much persecution.

SOCRATES (a-tes), *b.* at Athens about 470, *d.* 399 B.C., a great Athenian philosopher, the famous teacher of Plato, and the originator of a distinct school of ethical philosophy. His predecessors in philosophy aimed at discovering the laws of the natural universe, Socrates applied himself to the study of man. "Virtue is knowledge, vice is ignorance," sums up his main doctrine, and he spent much of his time questioning, in public places, men of repute, in order to convince them of their real ignorance. He was accused of introducing new divinities and of corrupting the youthful citizens, and was condemned to death. He drank a poisonous draught of hemlock in the presence of his friends, but his memory was enshrined in the beautiful portraits we have of him in Plato's "Phœdo" and "Apology." Xenophon, another of his young friends, wrote an account of him in his "Memorabilia."

SODA WATER, an aërated water containing a small quantity of bi-carbonate of soda in solution. The aëration is caused by charging water with carbonic acid gas, which is very soluble in water under pressure. The release of the pressure is followed by the escape of the gas.

SODOM AND GOMORRAH, two of the "cities of the plain" mentioned in Genesis xix., whose inhabitants were destroyed for their wickedness. According to tradition the remains of these cities were submerged beneath the waters of the Dead Sea, but geologists regard this as impossible.

SODOR AND MAN, the name given to the bishopric whose area of jurisdiction in mediæval times extended over the Scottish Hebrides and the Isle of Man. The word *Sodor* is derived from a Norwegian word meaning "southern," for the Hebrides were considered and named "Southern Islands" by the Norwegians.

SOFIA, or **SOPHIA,** the capital of Bulgaria since the constitution of that principality as an independent state under Turkish suzerainty in 1878. It stands in a valley of the Balkans on the main road from Constantinople to Vienna. Its business is chiefly in wheat, live stock, and hides; population 67,000.

SOHO. (1) A district in London south of Oxford Street. It contains a large colony of Italian and French cooks, restaurant proprietors, waiters, tailors, and servants. (2) A manufacturing suburb of Birmingham, where James Watt, in partnership with Matthew Boulton, produced his improved steam engines, 1775-1819.

SOKOTO, an island district of 200,000 square miles in the Niger basin, formerly administered by the Royal Niger Company but included in 1903 in the British Protectorate of Northern Nigeria, which is controlled by resident officials appointed by the Colonial Office. The centre of administration is Zungeru on a tributary of the Niger. Palm oil and kernels are the chief exports, and the protectorate is in telegraphic communication with Lagos.

SOLAR SYSTEM, THE, is the system of planets with their attendant satellites, which revolve about the sun, one of the fixed stars. In order of distance from the sun, the planets are Mercury, the nearest, Venus, the Earth, Mars, Jupiter, Saturn, Uranus, and Neptune; and of these Jupiter is the greatest in size, Mercury the least. The period of Neptune's revolution round the sun is 164 of our years, whilst the year of Mercury is 88 of our days.

SOLDERS, alloys readily fused, which are used for joining metals. Plumbers use an alloy consisting of one of tin to two of lead for joining lead piping. Iron is "cemented" by a solder of brass. Two of silver to one of brass makes an excellent solder for silver, and gold is soldered with an alloy of variable proportions of gold, silver, and copper. The use of hard solders for brass or copper is called brazing.

SOLE, a flat fish of high market value, caught chiefly in the North Sea. It is usually about twelve inches long. Its upper side is brownish yellow with dark patches. The *lemon sole* has spots instead of patches, and is much less esteemed as an article of food.

SOLECISM, any blunder in grammar or speech, or any breach of the rules of good behaviour in social life. The people of Soli spoke very rude Greek, and the cultured Athenians branded similar offences as "Solecisms," that is, mistakes such as the folk of Soli would make.

SOLENT, THE, is the name given to the western half of the channel which separates the Isle of Wight from Hampshire. It is rendered difficult of navigation for small craft by rapid tides.

SOLFATA'RA is the Italian name for a *soufrière* or semi-extinct volcano, which continues to emit gases and steam. At the time that Mount Pelée destroyed the town of St. Pierre in the terrible eruption of April, 1902, the famous Soufrière on the neighbouring island of St. Vincent awoke from its long quiescent condition, and 2,000 people were destroyed.

SOLFERINO, a village 20 miles north-west of Mantua, in the plain of Lombardy, where the French defeated the Austrians in 1859.

SOLOMON, the son of David and Bathsheba, succeeded David on the throne of Israel. During his peaceful forty years' reign the country reached its greatest territorial limits and its highest prosperity. He built the Temple at Jerusalem, and is still honoured in the mysteries of Freemasonry. His reputation for wisdom was not confined to the Jews, but is recognised throughout Mohammedan countries. The Books of "Proverbs" and "Ecclesiastes" are almost certainly not the work of Solomon, although tradition has assigned them to him; and the "Wisdom of Solomon" in the Apocrypha is of a much later date.

SOLON, *b.* about 638, *d.* 559 B.C., one of the greatest law givers of the world, gave to Athens its wonderful constitution. A poet, merchant, and traveller, his first great deed for his city was to gain for it the neighbouring isle of "Sea-girt Salamis." The lower classes in Athens were suffering from the oppressions of the rich aristocrats, and Solon, as chief magistrate, instituted a democratic form of constitution which retained the "Areopagus," or council of the old nobles, but opened up many channels of influence for the lower classes in the administration of justice, and in public offices. He divided the Athenians into four classes, according to their income, and gave both rights and responsibilities to these classes. He forbade the acquirement of much land, reformed the coinage, and annulled all excessive penalities.

SOLSTICE. Two days in the year mark the occurrence of solstices, the Summer Solstice, on June 21st, and the Winter Solstice, on December 21st. On these days the sun is vertically above the tropics of Cancer and Capricorn respectively, and these positions mark the turning points of the sun when it has reached its extreme limits north and south of the equator. The former is our mid-summer day, and the latter our mid-winter day.

SOLYMAN, THE MAGNIFICENT, *b.* about 1490, *d.* 1566, the greatest of the sultans of the Ottoman Turks, equally famous as a law giver, reformer, patron of arts, and conqueror. His greatest victory was at Mohacs, in Hungary, in 1526, when he annihilated the Hungarian army, subsequently annexing a great part of the country. His fleets scoured the Mediterranean, but failed to oust the knights of St. John from Malta.

SOMALILAND, the corner of land between the Gulf of Aden and the Indian Ocean, on the east coast of Africa. The country is subject to Abyssinia, except for the small protectorates reserved by Britain and Italy. The coast from 8° North Latitude to a point on the Gulf of Aden 49° East Longitude is British, the boundaries being settled by treaty with Abyssinia and Italy. A Mohammedan rising under the "Mad Mullah" in 1902 was met by regular military operations, which led, however, to no decisive engagement, unless General Egerton's victory at Jidballi, 1904, should prove to be so.

SOMERSET, one of the south-western counties of England. Historically interesting as the scene of Alfred's refuge at Athelney, and of Monmouth's defeat at Sedgemoor, the county contains many pre-historic relics, and is rich in Roman remains, particularly at Bath and Ilchester. Glastonbury is interesting as the former seat of a Saxon Monastery.

SOMERSET, PROTECTOR, *b.* about 1500, *d.* 1552, the brother of Jane Seymour, the third wife of Henry VIII., and mother of Edward VI. He was raised to the peerage by Henry VIII., and became Duke of Somerset in the following reign. He acted as Protector during the greater part of Edward's reign, but the sweeping changes of the Reformation movement caused him to be unpopular, and he was supplanted by the Earl of Warwick, who succeeded him as Protector with the title of Duke of Northumberland. Somerset was executed in 1552 on a charge of treason.

SOMNAMBULISM. See *Med. Dict.*

SONATA, an elaborate composition in three or four movements usually for one instrument. Vocal music predominated up to the 17th century, both in sacred music and in part songs and madrigals. Subsequently, instrumental music developed, and the sonata became a recognized form of composition. See *Glossary of Musical Terms.*

SONNET, a rhyming composition of fourteen lines, embodying a single theme or idea. The Italian, or original, form contained either four or five rhymes, and was clearly divided into an octave (the first eight lines), and a sestet (the last six lines). Shakespeare and the Elizabethan sonneteers made a free use of the sonnet, and broke through the rules of rhyming; but Milton, and his imitator, Wordsworth, reverted to the Italian form, which most modern sonneteers of the 19th century, including Rossetti, have followed.

SOPHIA, ST., the great Church of Constantinople built in the 6th century by the Emperor Justinian, and now used as a Moslem Cathedral. Its dome and the gracefulness of its lines in the interior are striking, but its external appearance is disappointing.

SOPHOCLES, *b.* 496, *d.* 405 B.C., an Athenian tragic poet. Less than one-tenth of the plays of Sophocles remain, but those we have are masterpieces. "Ajax," "Antigone," and "Electra," "Œdipus

Tyrannus" and "Œdipus at Colonus" are among his great tragedies. "Most modern critics have agreed that the tragedies of Sophocles are the most perfect that the world has ever seen." *Mahaffy.*

SORBONNE, THE, the first residential college of the University of Paris, founded in the 13th century by Robert of Sorbon. It became the greatest of all theological colleges, and was chiefly renowned for the rhetorical skill of its scholars. Failing to respond to the liberal tendencies of the Renaissance, it lost its prestige and was abolished at the Revolution (1792). Napoleon re-established it as the home of the *Academie.* It has been entirely rebuilt (1885-90).

SOTHEBY'S, the principal book-auction room in the United Kingdom, at Wellington Street, Strand. The first auction was held here in 1744. One of the most famous sales at Sotheby's was that of the Ashburnham collection of books and manuscripts, which realised more than £100,000. Though the sale of books constitutes the principal part of the business, prints, coins and antiquities are also here brought to the hammer.

SOUDAN, THE, "Land of the Blacks," is a general term for a wide belt of territory stretching across Africa, south of the Sahara, from the Atlantic to the western borders of Abyssinia. *East Soudan,* a region between Egypt proper and British East Africa, forms a joint protectorate of England and Egypt, with Khartoum as the seat of Government. *Central Soudan,* a region around Lake Chad, is occupied by Negro States, sufficiently large and civilized to be called Kingdoms. *West Soudan* comprises the basin of the Niger and the coast lands between the delta of that river and the Senegal. This region, with the exception of Liberia, has been parcelled out among the French, British, and Germans.

SOUL, may be defined as the non-corporeal part of man. In its higher aspects, and apart from the body, it is sometimes termed *spirit,* a distinction which some theologians emphasise, keeping the term "soul" to denote its lower relationship with the body. The soul is believed to be that essential part of a man by virtue of which he feels, thinks, wills, and develops personality, and which is almost universally believed to be immortal.

SOULT, MARSHAL, *b.* 1769, *d.* 1851, one of Napoleon's greatest generals. He commanded the French right at Austerlitz, and was placed in command of operations against England and Spain in the Peninsular War, where, however, his brilliance was neutralised by Wellington's persistent patience and hard fighting. He represented France at the coronation of Queen Victoria, and was received with enthusiasm.

SOUND, a sensation received through the organs of hearing. A musical sound, or *tone,* is the result of a regular succession of vibrations communicated to the ear by the wave movement of the air. Vibrations set up in a vacuum produce no sound, because they are not communicated to the air. The *pitch* of a musical sound rises with the rate of vibration. The *intensity* of the sound depends upon the amplitude of the vibrations and the distance of the observer.

SOUND, THE, a strait separating Denmark from Sweden, and leading from the Cattegat into the Baltic Sea. It is three miles broad at its narrowest part, and is defended by the Danish fortifications at Kronberg.

SOUNDING, the process of determining the depths of seas and water-ways for purposes of navigation or scientific investigation. Naval charts are carefully constructed from reliable soundings, to show shoals and all sub-marine obstructions. Deep sea soundings, such as were so largely carried out on the *Challenger,* are performed with a wire or thick hempen rope, and a detachable heavy sinker. The sinker is liberated by contact with the bottom, and a tube, arranged to take a sample of the bottom is all that is drawn up. If depth only is required, a thin twine is used and cut adrift when the bottom is reached.

SOUTH AFRICA, BRITISH. Refer to *Index.*

SOUTHAMPTON, on a peninsula at the head of Southampton Water in Hampshire, 79 miles from London. It is a great sea-port with excellent dock accommodation. It is a port of departure for the Union Castle Line to South Africa, and of the Royal Mail Line to the West Indies and South America, and it is a port of call for the Norddeutscher Lloyd Line. The headquarters of the Ordnance Survey are at Southampton, and in Hartley University College the town has an educational institute of good standing. Much of the old town still remains to remind the visitor of the days when legends told of Bevis of Hampton, or when Henry V. embarked for the campaign of Agincourt. (For population, etc., see p. 902.)

SOUTH AUSTRALIA, one of the federated colonies of the Australian Commonwealth, extends in a belt from the south coast across the continent to the north coast between 129° and 141° East longitude. Refer to "South Australia" in *Index.*

SOUTHCOTE, JOANNA, *b.* 1750, *d.* 1814; a religious monomaniac, who after being till middle life a devout Methodist, began, in about 1790, to proclaim herself a prophetess. She professed to be the woman mentioned in Rev. xii., and gained many converts. At last she gave out that she was about to give birth to the promised Shiloh, but soon after the time she fixed for that event died of dropsy.

SOUTHEY, ROBERT, *b.* at Bristol, 1774, *d.* 1843, was a writer of both prose and poetry. He became poet laureate in 1813, and is known as one of the "Lake Poets," his home for many years being at Greta Hall, Keswick. His longer poems are little read now, but his ballads and lyrics are popular. His prose works include a "Life of Nelson," histories of the Peninsular War and of Brazil, and biographies of Bunyan and Wesley.

SOUTHPORT, on the coast of Lancashire, halfway between Liverpool and Preston, is fast becoming a residential district for these towns and Manchester. Its fine sands and mild climate attract also thousands of more temporary sojourners, to whom many facilities for enjoyment are offered.

SOUTH SEA, the name given to the Pacific by Balboa, its discoverer, 1513. Previously to the 19th century the name was commonly applied to the South Pacific, and is still used in that sense.

SOUTH SEA BUBBLE, a financial project formed in 1710, to take over the floating debt of the nation, amounting at that time to £10,000,000. The Company was to receive from the Government interest on this amount at the rate of six per cent., and also the monopoly of the trade with the South Seas. Further subscriptions were called for in 1720 to buy up the remainder of the national debt, and were subscribed many times over. The £100 shares rose to £1,000, at which price the Chairman and many Directors sold out. Prices soon fell, the bubble burst, and thousands were ruined. The credit of the country was finally restored by Walpole.

SOUTH SHIELDS. See under *Tyne.*

SOUTHWELL, a small town near Newark, in Nottinghamshire, became the seat of a bishopric in 1884, the diocese including the counties of Nottingham and Derbyshire. At a house in the town Charles I. surrendered himself to the Scottish Commissioners, 1646.

SOUTHWELL, ROBERT, *b.* 1560, *d.* 1595; a Jesuit martyr of Elizabeth's reign. After being educated at Douai and Tournay, he was admitted a Jesuit at Rome. He served in England as chaplain to various noble Roman Catholic families, but was at last taken, tortured, and executed at Tyburn, the victim of a barbarous statute. Some of his religious poems are very beautiful.

SPA, a popular Belgian watering place, is situated about 20 miles south-east of Liege. Its medicinal springs, the waters of which are consumed by visitors, and also exported in considerable quantities, have been famous from Roman times. The name *Spa,* denoting an inland watering place, is derived from this, one of the oldest of European health resorts.

SPAIN occupies more than five-sixths of the Iberian peninsula in the south-west of Europe, and has an area of 191,000 square miles, and a population exceeding 18½ millions. In the 16th century it was the most powerful nation in the world. Agriculture employs more than 70 per cent. of the people. The various cereals, the olive, and the vine are cultivated, and millions of merino sheep are pastured. The mineral wealth is enormous, but is not fully developed. The mines produce iron, coal, copper, lead, and quicksilver. The manufactures are unimportant. A position fronting the Mediterranean and the Bay of Biscay, the possession of many fine natural harbours, and the natural resources of the country would be sufficient to place Spain in the forefront of commercial nations but for the indolence of the inhabitants.

SPANISH-AMERICAN WAR, THE, arose out of the demand of the United States Government, in 1898, that the Spaniards should evacuate Cuba, which had been in a state of insurrection since 1895. The immediate cause was the blowing up of the United States' ship Maine. The principal events of the war were the destruction of the Spanish fleet, and the capture of Santiago and the eastern part of the island by American troops. Consequently, the Spaniards agreed, 1898, to relinquish Cuba, which has since become a republic under the suzerainty of the United States. Spain also resigned to America Porto Rico and the Philippine Islands.

SPANISH ARMADA. See *Armada, The Invincible.*

SPANISH SUCCESSION, WAR OF THE, was undertaken to prevent the possible union of the French and Spanish Crowns. The Grand Alliance, including England, Holland, Austria, Germany, and Portugal supported the claims of Charles, the second son of Leopold of Austria, against those of Philip the son of the dauphin of France, to whom the throne had been left by the will of the late king. The war, which lasted from 1702 to 1713, was chiefly waged in the Spanish Netherlands. The principal events were the victories of Marlborough at Blenheim, Ramillies, Oudenarde, and Malplaquet, and the capture of Gibraltar. By the treaty of Utrecht, 1713, Philip was acknowledged king of Spain, and Louis XIV. of France agreed to give no further support to the Stuarts.

SPARROW, the most common British bird, is found throughout Europe and in

parts of Asia, and has been introduced into the United States, where it thrives at the expense of native birds. There are two species in England, the house-sparrow and the field or tree-sparrow. The so-called "hedge-sparrow" is really the hedge-warbler. The *house-sparrow* frequents even the busiest parts of our largest cities, building its nest in nooks of walls and under the eaves of houses, and raising as many as three broods a year. It is lively, pert, and cunning, the true *gamin* of the winged race. It is omnivorous, but prefers seeds and the larvæ of insects. On the whole, it may be reckoned among useful birds.

SPARTA, or **LACEDÆMON**, a city of ancient Greece, the capital of Laconia in the Peloponnesus, famous for the warlike prowess of its citizens. The laws of Lycurgus laid the foundation of Sparta's greatness. The inhabitants were distinguished for the simplicity of their life, terseness of speech, and courage and determination in battle. The males were trained from the age of seven under the supervision of the State, and apart from their mothers. They were taught to endure hardships and to suffer pain without complaining. Both sexes went through a rigorous course of gymnastics with the object of producing a physically perfect race of citizens. At the time of the Persian invasion in the 5th century B.C., the Spartans, with the consent of all the Greeks, obtained the chief command in the war. Subsequently, Athens and Sparta fought for supremacy in Greece with varying success, until the whole country fell under the domination of Macedonia, about 340 B.C. Sparta passed 146 B.C., under Roman rule.

SPAVIN is a vague term denoting something wrong with the hock of a horse. It occurs in two forms: (1) *Bog Spavin*, an acute synovitis common in young horses worked too soon; (2) *Bone Spavin*, a chronic disease of the hock met with in old horses in which a chronic inflammation of the joint has resulted in the formation of bone around it. In both cases lameness results, and rest is essential. The treatment should be left to a veterinary surgeon.

SPECIFIC GRAVITY, the ratio of the weight of a given volume of any substance to that of an equal volume of some particular substance taken as the standard. In the cases of gases, Hydrogen is taken as the standard of comparison, and water for liquids and solids. Thus, taking water as unity, the specific gravity of gold is 19·3, that is, gold is 19·3 times as heavy as water, bulk for bulk; or the *density* of gold is 19·3 times that of water.

SPECTACLES are needed in certain cases of defective vision to assist the eye in focussing the rays of light on to the retina. In "far-sightedness," a common defect of advancing age, the rays of light from near objects are not sufficiently refracted by the ordinary organism of the eye, and tend to converge to a focus beyond the retina. In such cases convex lenses of suitable curvature remedy the defect. The eyes of short-sighted persons have too much convergent power, and naturally an image of the object looked at is formed in front of the retina. Concave lenses enable the eye in such cases to focus the image on the retina itself.

SPECTATOR, THE, a periodical founded by Richard Steele and Joseph Addison, published daily from March, 1711, to December, 1712, and revived by Addison from June to December, 1714. Politics were excluded. The publication contained essays on literature, religion, manners, etc. Among the best were Addison's essays on Milton, and the papers which introduced Sir Roger de Coverley.

SPECTROSCOPE, an instrument for analysing the light proceeding from any luminous body. The simplest form is that known as the "direct-vision spectroscope." It consists of three tubes which are joined together when the instrument is in use. At the end of the first tube is a narrow slit through which a pencil of the light to be examined is admitted. This passes into the second tube through a convex lens so placed that the narrow slit is situated in its principal focus, and consequently the emergent rays are parallel. The second tube contains a series of prisms of flint glass and crown glass arranged alternately. The light, in passing through these, undergoes dispersion, and forms a spectrum (*which see*) which is viewed through a compound eye-piece in the third tube.

SPECTRUM, the name given to a band of light which has entered through a narrow slit, and been projected on a screen in a darkened chamber, after undergoing dispersion in passing through a prism or prisms placed in its path. In the case of white light, such as sunlight, the electric-light, or lime-light, the spectrum is composed of a series of coloured bands arranged in the following order—red, orange, yellow, green, blue, indigo, and violet. Red light gives a red spectrum, green light a green spectrum, and so on.

SPECTRUM ANALYSIS. It is found that the spectra produced by the light from glowing vapours or gases consist of bright lines crossing a dark band. These lines, called from their elucidator Fraunhofer lines, occupy a definite position relatively to the continuous spectrum of white light, and are different in colour and position for different substances. Every gas in a state of incandescence produces its own characteristic lines or group of lines. Moreover, if more than one gas be present, the characteristic lines of all may be distinguished in the resulting spectrum; so that, if it is required to discover the elements of which a compound substance is composed, it is only necessary to reduce the substance to a condition of glowing vapour by the application of heat, and examine the resulting spectrum. The lines of the spectrum will at once reveal the composition of the substance.

SPEKE, JOHN HANNING, *b.* in Somersetshire, 1823, *d.* 1864, a celebrated African explorer. After serving with distinction in the army of the East Indian Company he joined Burton in an exploring expedition into Somaliland in 1854, and four years later the two attempted to trace the Nile to its source, and discovered the Victoria Nyanza. In 1859 Speke undertook another expedition, this time with Grant as his companion, for the purpose of verifying his supposition that this lake was the real source of the Nile. He published the results of his observations in a book entitled a "Journal of the Discovery of the Source of the Nile," 1863.

SPENCER, HERBERT, *b.* at Derby, 1820, *d.* 1903, an eminent scientist, and the greatest English philosopher of recent times. He began life as a civil engineer, but relinquished that calling for journalism, and contributed regularly to the "Economist," the "Westminster Review," and the "Edinburgh." In 1860 he published the outlines of a new system of philosophy based on the doctrine of evolution. His "First Principles of a system of Philosophy" followed in 1862, and the next twenty years were devoted to the "Synthetic Philosophy," which was published in twelve volumes. Life, conduct, society, ceremonial, political and ecclesiastical institutions are all treated from the standpoint of the evolutionist.

SPENSER, EDMUND, *b.* in London, 1552, *d.* 1599, a celebrated English poet. The "Shepherd's Calendar" appeared in 1579, and was dedicated to his friend and patron, Sir Philip Sidney. His greatest poem, the "Faërie Queene," was to have consisted of twelve books, but only six exist. (See *Faërie Queene.*)

SPERMACETI, an oily fluid obtained from two large cavities in the head of the sperm-whale. It solidifies on exposure to the air. After being refined the substance is employed in the preparation of ointments, and also for the manufacture of candles.

SPEZIA, the principal naval station of Italy, stands at the head of a magnificent harbour, about 50 miles south-east of Genoa. The town contains a naval arsenal, gun foundries, and a dock-yard.

SPHINX, THE, an immense figure, exceeding 170 feet in length and 100 feet in height, hewn out of the rock in the vicinity of the group of pyramids at Gizeh, Egypt. The body and paws are those of a lion, the face and breast those of a woman. The face impresses by its calm dignity, and the whole figure by its sovereign power. The monument is considered one of the most ancient in Egypt. The shifting sands of the surrounding desert are constantly covering it, and it is found necessary to clear them away at intervals.

SPICE ISLANDS. See *Moluccas.*

SPICES, the name given to certain vegetable productions, such as pepper, cloves, cinnamon, nutmeg, etc., all of which contain an essential oil that gives to the substance an aromatic odour, and a hot pungent flavour. They are derived from various parts of plants—the fruit, the seed, the bark, and the root. The largest supply is obtained from the East Indian Archipelago.

SPIDERS are small animals (not insects) in which the head and thorax are united into a single division, which is joined to the abdomen by a narrow stalk. The spinnerets are situated near the hinder end of the abdomen. In the common house-spider each spinneret contains as many as 400 holes from each of which issues a minute filament of the material of which the web is composed, the filaments forming strands which are pressed together by the animal's hind legs to produce the threads of the web. Of the many species of spiders the most remarkable, perhaps, is the trap-door spider, which is common along the Mediterranean shores, and in California and Jamaica, and which excavates for itself a home in the ground, cleverly closed by a hinged trap-door composed of layers of earth and web.

SPIKENARD, or **NARD**, a perfume derived from a plant of the order *Valerian*, growing on the Himalayas at a height of from 10,000 to 17,000 feet. A similar plant is found high up in the Alps. Oils and unguents perfumed with spikenard are still popular in the East, and are very costly.

SPINNING is the art of reducing the fibres of silk, wool, cotton, or flax into fine threads of uniform size ready for the weaver. This was formerly accomplished by hand, at first with the aid of the spindle and distaff, and afterwards with the help of the spinning-wheel. With such primitive apparatus the spinner was able to produce only a single yarn at a time, but the inventions of Arkwright and Crompton changed all this, and gave a tremendous impetus to the various textile manufactures.

SPINOZA, BARUCH, *b.* at Amsterdam, 1632, *d.* 1677, was educated for the rabbinical office, but his study of Descartes and other philosophic writers led him to

question portions of the Jewish faith, and he was excommunicated from the Jewish Church. At the Hague he gained a livelihood by polishing the lenses of optical instruments, and devoted his leisure to the study of philosophy. His principal works were published after his death. In his "Ethics" he attempted to develop his views by geometrical methods, starting with certain definitions and axioms, and then proceeding to state and demonstrate his propositions one by one.

SPION KOP, a rugged hill on the left bank of the Tugela, Natal. The hill was captured by General Buller's forces in their attempt to release Ladysmith, on the night of January 23rd, 1900. During the next day the summit was exposed to such a terrible fire from the Boer guns that Colonel Thorneycroft, in the evening, withdrew his men, and the British recrossed to the right bank of the Tugela.

SPIRES, or SPEYER, an ancient city in Bavaria, on the left bank of the Rhine. At a diet of the German princes, held here in 1529, the Act of Toleration, passed in 1526, was annulled. The minority prepared a protest on the ground that the diet had overstepped its authority in thus annulling what had been unanimously passed three years previously. This *protest* is the origin of the word "Protestant" as applied to a religious body.

SPIRITUALISM, in its modern form, originated in America, which is still the head-quarters of the cult, in 1848, and was introduced from that country into England in 1852. Its adherents, who now number many millions in all parts of the world, and include many eminent scientists, profess to be able to communicate, through certain of their members, known as mediums, with the spirits of the dead. The latter are said to manifest their presence by spirit-rapping, spirit writing, drawing, and photography, and by lifting and moving heavy bodies. The "Society for Psychical Research" was founded in 1882 "for the purpose of making an organised attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic."

SPITALFIELDS, a district in the east of London forming part of the borough of the Tower Hamlets. It took its name from the spital or hospital of St. Mary, founded there in the 12th century. After the revocation of the Edict of Nantes a number of French Refugees settled in the district and introduced the art of silk-weaving, for which Spitalfields was long famous. A few looms are still at work on the outskirts, but the staple industry now is the manufacture of boot and shoes.

SPITHEAD, the eastern portion of the strait separating the Isle of Wight from the mainland, receives its name from the *Spit*, a sandbank which runs out for a distance of three miles from the coast of Hampshire. Spithead forms a sheltered roadstead, and as such is much used by the ships of the British navy.

SPITZBERGEN, an archipelago of five large and several smaller islands, situated in the Arctic Ocean, about 400 miles north of Norway. During the short summer the islands are visited by Norwegian and Russian seal fishers and fur hunters.

SPOHR, LOUIS, *b.* in Brunswick, 1784, *d.* 1859, a celebrated violinist and musical composer. He composed operas, oratorios, and several works for his favourite instrument. His best known oratorios are the "Last Judgment," the "Fall of Babylon," and "Calvary."

SPONGES, as used for toilet and other purposes, are the skeletons of an aggregation of minute marine animals. The lower part of the animal, which is usually of a cylindrical shape, becomes attached to a stone or rock, or to the horny remains of crustaceans. When a number of these animals grow closely pressed together their outer walls partly coalesce, but a number of spaces are left into which the pores from each animal open. In this way is gradually built up a system of tubes and smaller pores freely communicating with one another, the framework of which is composed of a horny, elastic tissue secreted by the animals. The principal sponge fisheries are in the eastern part of the Mediterranean and round the West Indian Islands.

SPONTANEOUS GENERATION. See *Abiogenesis.*

SPORES are the first stage in the life history of the lower plants—seaweed, fungi, mosses, and ferns. Just as the flowering plants grow from seeds, so do the lower plants from spores. The masses of brown powder on the under side of the frond of a fern are the most familiar examples of spores. Spores are microscopic in size, and are scattered when ripe either by the wind or by water. The spores of some fungi and seaweeds are capable of swimming actively in the water and thus effecting their own dispersal. This is one of the few examples in the plant world of the power of free movement, which is so common in the animal world; hence such spores are termed zoospores. Most spores present remarkable vitality, withstanding boiling, freezing, or desiccation.

SPRINGS are discharges of water which has accumulated underground. Part of the water that has fallen as rain has penetrated through pervious strata of rocks until it has met with an impervious stratum. If this is slightly inclined the water flows along between the two strata to reappear at length at the surface, most probably on the side of a hill. Springs formed in this way are dependent on the local rainfall, and cease to flow in a season of drought. In other cases, springs are derived from large, deep-seated accumulations of water, the gathering ground for which is spread over an extensive area. From the subterranean reservoirs the water finds its way to the surface through cracks and fissures, and produces a spring of perennial character. Such springs may be hot or cold. The waters of some *thermal* springs, as in the case of the Geysers of Iceland and the Rocky Mountains, the hot springs of New Zealand, etc., are at boiling point when they reach the surface. The hot springs of Bath have a temperature of 120° F., those of Buxton of 82° F. All hot springs and many cold ones contain salts in solution, and, for this reason, many of them are of medicinal value. Harrogate waters are sulphurous, the Buxton springs and those of Tunbridge Wells contain salts of iron, while the brine springs of Cheshire and Worcestershire are impregnated with common salt.

SPURGEON, CHARLES HADDON, *b.* at Kelvedon, Essex, 1834, *d.* 1892, a famous Nonconformist preacher. In 1854 he was invited to become the pastor of a Baptist chapel in Southwark. His fame spread to such an extent that it was eventually found necessary to erect the Metropolitan Tabernacle, a building capable of accommodating 6,000 persons. Here he preached to thousands weekly, and influenced thousands of others by printing his sermons and circulating them throughout the Empire. He founded the Pastors' College, the Stockwell Orphanage, and a number of other institutions.

SPURS. Modern spurs are not so formidable as their predecessors, in fact, they have become little more than ornaments to the horseman's heel; for, though commonly worn by huntsmen, jockeys, and cavalry soldiers, they are used as goads to the horses only in extreme cases. To the skilled rider, however, they are of great value, as a slight pressure with the calf of the leg makes the horse respond promptly once he is aware that his rider wears spurs. In the days of chivalry, the knight was distinguished from his squire by wearing spurs of gold or silver gilt. The squire who attained his knighthood by his gallantry was said to "win his spurs," and he who disgraced his order might be degraded by having his spurs publicly struck from his heels.

SPY, a person sent secretly into an enemy's country or encampment to obtain information with regard to the strength and distribution of his forces, the position and nature of the fortifications, and the number and calibre of the guns, etc. Although the employment of such persons by belligerents is recognised by international law, when captured, the spy is liable by martial law to capital punishment. In consequence of the dishonour that attaches to the occupation, owing to the treachery that must necessarily be exercised, and also on account of the risks attending it, a general may not compel any of his subordinates to act the part. The spy must volunteer for the work, and his services are usually procured by the offer of large rewards.

SQUADRON. (1) In the army, a squadron is the principal division of a regiment of cavalry, and consists of two troops, each of from 60 to 100 men. (2) In the navy, a squadron consists of a portion of a fleet employed for some special service, or placed on a particular station under the command of a flag officer.

STAËL, MADAME DE, *b.* in Paris, 1766, *d.* 1817, a celebrated French authoress. She first obtained public notice by her "Letters on the Works and Character of Rousseau," published in 1788. Though in sympathy with the Royal Family she continued to reside in Paris during the period of the Revolution, exerted herself on behalf of the victims of the Reign of Terror, and wrote a powerful appeal in favour of the Queen. The views on Napoleon and his work expressed in her writings led to her banishment from Paris, and after the publication of "Corinne," in 1807, she was expelled from France. Her famous work on Germany was published in London in 1813. After the fall of Napoleon she returned to Paris and there wrote "Ten years of Exile," and three volumes of her "Memoirs of the Revolution," a work that was not completed at her death.

STAFFA, a small island of the Inner Hebrides, lying to the west of Mull, and famous for its basaltic pillars and caverns, especially Fingal's cave, the entrance and sides of which are composed of gigantic pentagonal and hexagonal columns.

STAGGERS, a disease in sheep indicated by the animal's reeling in walking. It is due to the presence in the brain of the immature embryo of a species of tapeworm that, in its perfect form, inhabits the intestines of dogs. The eggs of these tape-worms are swallowed by the sheep, are partially developed in the stomach, and from thence find their way into the brain tissue. The term is also popularly applied to several diseases of horses, especially to inflammation of the brain, known as "mad or sleeping staggers," and to an acute form of indigestion, commonly called "stomach staggers."

STALACTITES are conical masses of calcareous matter hanging from the roofs of limestone caves. They are produced by water, containing carbonic acid and

chalk in solution, which filters through the roof of the cavern; on exposure to the air, the carbonic acid evaporates, and the chalk is precipitated. The stalactite grows by the addition of fresh material brought by the water trickling over it, and as the base is much older than the apex, it acquires a conical shape with the point downwards. The water dripping from the stalactite on to the floor of the cavern produces a similar chalky deposit there, which gradually rises as a column known as a *stalagmite*. Eventually stalactite and stalagmite unite into a continuous pillar.

STAMBOUL, i.e., "the city," the name given by European Turks to Constantinople, and the name commonly given to the oldest part of the city.

STAMFORD BRIDGE, a village on the Derwent, in Yorkshire, the scene of Harold's victory over the invaders led by his brother Tostig and the king of Norway, 1066.

STAMP ACT, an act passed by the English Parliament in 1765, which required that all legal documents used in the Colonies should bear government stamps. It was resisted by the American colonists and was repealed in the following year.

STAMPS. The credit of the invention of the adhesive postage stamp has been claimed both for Sir Rowland Hill and for Mr. James Chalmers, a bookseller of Dundee. Sir Rowland Hill recommended their use in a pamphlet on post-office reform, published in February, 1837, and soon after the "Penny Post" was introduced, and the franking of letters abolished adhesive stamps were adopted as part of the scheme of reform. The first English postage stamp was black, and was introduced in 1841. Since that date there have been many changes in design and colour. Stamp collecting, which is now such a wide-spread hobby, first became popular about the year 1861. There are now several philatelic societies, and special journals are published in the interests of collectors.

STANDARD, BATTLE OF THE, was fought near Northallerton, Yorkshire, 1138, and received its name from the circumstance that a sacred standard, composed of the banners of three Saxon saints, was erected on the battle-field. David of Scotland, who had invaded the north of England on behalf of his niece Matilda, was defeated by the forces raised by Thurston, Archbishop of York.

STANDISH, MILES, *b.* in Lancashire, 1584, *d.* 1656; one of the "Mayflower" emigrants to Massachusetts in 1620. As long as he lived he was the soul of the resistance to the Indians, who often tried to raid the little colony. His courtship of his second wife has been immortalised by Longfellow.

STANLEY, ARTHUR PENRHYN, *b.* at Alderley, Cheshire, 1815, *d.* 1881, was Dean of Westminster from 1863 till his death. He was a leader of the "Broad Church" party. His published works include "Life of Dr. Arnold," "Sinai and Palestine," "Historical Monuments of Westminster Abbey," and various lectures on religious subjects.

STANLEY, SIR HENRY MORTON, *b.* near Denbigh, 1840, *d.* 1904, a famous African explorer. Stanley is a conspicuous instance of a "self-made man." He was of obscure parentage, worked his way to America as cabin-boy, and in course of time became a newspaper correspondent. In 1871, being sent by the proprietor of the New York Herald to "find" Livingstone, he met him at Ujiji, and accompanied him in one of his exploring expeditions. He explored the lake region of Equatorial Africa, and discovered the Albert Edward Nyanza. But his greatest feat was the voyage he made through the heart of Africa on the Congo, thus clearing up the mystery of its source and course, 1876-77. Ten years later he led the "Emin Relief Expedition," returning to Europe with Emin Pasha, the object of his quest, in 1890. His various journeys were described in his books, "The Congo and its Free State," and "In Darkest Africa," and also formed the subjects of a series of lectures delivered by him in England and America.

STANNARIES, tin mines (L. *stannum*, tin). The antiquity of the tin mines of Cornwall, reaching back to a period long before Julius Cæsar, has caused Cornish local customs and rights to enjoy a continuance hard to equal in the world. In the reign of Edward I. a charter was given to the Cornish tinmen, granting them their own courts for all suits except those relating to life, limb, or land. This was the origin of the Stannary Parliament, which, though remodelled in 1836, has still wide powers over the tin districts.

STAPLE, an old Saxon word meaning "a heap." Hence the commodity principally piled up for sale at a given place was called the *staple* of that place. Also, in mediæval times, certain towns were appointed for the sale of certain articles, and these towns were called the *staples* for such articles; thus Calais was for 200 years previous to its loss in 1558, the *staple* for English wool on the continent.

STAR OF INDIA. Refer to *Index*.

STARCH is a white substance composed of granules, each of which consists of a number of layers arranged around a central nucleus. It is widely diffused throughout the vegetable world, and is especially abundant in potatoes, the various cereals, arrow-root, etc. It forms one of the most valuable of the class of foods known as carbo-hydrates that are chiefly concerned in the production of animal heat and energy. In the process of digestion the starch in the food is rendered soluble by the action of the saliva and of pancreatic juice. Starch for domestic purposes is prepared chiefly from potatoes.

STAR CHAMBER, a court that was either created or remodelled by Henry VII., received its name from the fact that the ceiling of the room in which it first met was ornamented with a number of gilt stars. At first it provided a check for influential offenders against the law, who were able to intimidate the ordinary courts; but in the reign of Charles I. it supported that monarch in his unconstitutional methods, and was abolished by the Long Parliament in 1641.

STARS, with the exceptions of the planets, are distant suns, the distance of some of the nearest being more than 500,000 times the distance of the earth from the sun. According to their brightness they are classified as being of the first, second, third, down to the sixteenth magnitude. Only those of the first six classes are visible to the naked eye, and of these there are about 3,000. Powerful telescopes reveal more than 20 millions, 18 millions of which go to form the Milky Way. Some are white in colour, others yellow or orange, others red, and others blue or green, but these various tints are, as a rule, only perceptible when the stars are viewed through a telescope. The stars have been grouped into constellations, to each of which the ancient astronomers gave some fanciful name, according to the object the group was supposed to represent. Of these, twelve are visible in both the northern and southern hemispheres, and are known as the Zodiacal Constellations. The principal constellations in the Northern Hemisphere are the Great Bear, the Lyre, the Lady's Chair (Cassiopeia), and the Eagle. In the Southern Hemisphere the chief constellations are Orion and the Southern Cross. Some stars are so intimately connected that each revolves round the other. These are known as *double* or *multiple* stars.

STARS AND STRIPES, the national flag of the United States of America. It is composed of red and white horizontal stripes with a number of white stars let into a blue ground in the upper corner nearest the staff. Thirteen stripes and thirteen stars were taken to represent the thirteen original States of the Union, and a star has been added for each State admitted since.

STATIONERS HALL, the hall of the "Worshipful Company of Stationers," situated in Ave Maria Lane, London. It is customary for the proprietors of any literary or artistic work to register his name as such at Stationers' Hall. Such registration does not now confer a copyright—the proprietor is invested with that by the act of publication—but it empowers him to take proceedings against those who infringe his copyright, for the certified copy of the entry in the register is admitted as evidence of proprietorship in all courts of law.

STAUNTON, HOWARD, *b.* 1810, *d.* 1874, a celebrated chess player who became the chess champion in 1848. His books, the "Chess Player's Handbook," "Chess Player's Companion," and "Chess Praxis" did much to popularise the game. He was also famed as a Shakespearian scholar, and published an annotated edition of the poet's works.

STEAM is the vapour obtained by heating water to the boiling-point. It is dry, transparent, and invisible. The cloud or mist popularly known as steam, is produced only when the vapour mixes with air at a lower temperature than itself, and is due to condensation. In passing from the liquid to the gaseous condition steam absorbs a considerable quantity of heat, which is given up again when condensation takes place. This is known as the latent heat of steam, and is of service in cookery, the steam becoming condensed as it passes through the substances cooking in the steamer. But the property of steam that renders it of greatest service to man is its elasticity, that is, the resistance it offers to compression. When produced at a temperature of 212° F. this elastic force is just sufficient to resist a pressure of one atmosphere, or about 15 lbs. on the square inch; but if the volume of the gas be compressed to one-half, the force is doubled; if to one-third, trebled; and so on. The immense energy of steam may be understood when it is considered that a cubic foot of water is convertible into 1,662 cubic feet of steam.

STEAM ENGINE, a machine that converts the energy derived from the combustion of various kinds of fuel into mechanical work through the agency of steam. There are two principal types, the condensing, or low-pressure engine, and the non-condensing, or high-pressure engine. The *condensing engine* contains three essential parts, the boiler, the cylinder, and the condenser. The steam is generated in the boiler, and is led at a high pressure, by means of the steam-pipe, into a box called the valve-chest placed by the side of the cylinder. In the side of this chest there are three openings, or *ports*, that are opened and closed alternately by means of a slide-valve containing a hollow. The upper port communicates with the upper end of the cylinder, the middle one with the con

denser, and the lower one with the lower end of the cylinder. The steam admitted into the cylinder through the upper port exerts a pressure on that side of the piston, and drives it forward until it has almost reached the limit of its downward stroke, by which time the slide-valve has closed the upper port and opened the lower one. The steam above the piston escapes into the hollow in the slide valve and passes thence into the condenser. The pressure being thus removed from the upper side, the elastic force of the steam admitted into the lower end of the cylinder, through the lower port, drives the piston to its original position. This forward and backward motion of the piston is communicated to a beam by means of a connecting rod, or is converted into rotary motion by means of various mechanical contrivances. In the condenser the escaping steam meets with a jet of cold water, by means of which it is condensed, the resulting warm water being pumped out into a reservoir by means of the air-pump worked by the engine. Part of the warm water becomes the feed-water for the boiler, and the remainder is run off. Uniformity of speed is obtained by means of a fly-wheel, and also by employing various forms of "governors," which open a throttle-valve automatically, and thus allow of an escape of steam when the speed of the engine exceeds a certain limit. In the *non-condensing engine* the cylinder is exhausted of steam into the open air. This class is more compact, and of simpler construction, there being fewer working parts; but, since the piston at each stroke has to overcome the pressure of the external air in exhausting the cylinder of steam, there is a greater consumption of fuel for the same amount of effective work than when the condensing engine is employed. Still, it lends itself to conditions in which the other type would be impracticable, and is largely used where portable engines are necessary, as on wharves and quays, and for locomotives and traction purposes generally.

STEAM HAMMER, THE, is of immense service in the forging of heavy guns, armour plates, etc. The first that came into extensive use was that patented by Nasmyth, in which the hammer head was attached to the piston rod. Condie's was intended to remove certain weaknesses that became apparent in the earlier forms, particularly the frequent breaking of the piston or piston rod owing to the fact that the jar of each stroke of the hammer was transmitted to those parts. The anvil is placed between two upright wrought-iron standards which are joined at the top. The piston-rod is fixed to this framework. The steam cylinder is movable, and the hammer face is dovetailed into its lower end. Steam is admitted into the movable cylinder above the piston, and its elastic force causes the cylinder to rise between the guides to the required height. An exhaust valve is then opened, the steam escapes, and the cylinder with the hammer attached descends by its own weight. The air compressed between the lower end of the cylinder and the piston gives, by its expansion, an additional impetus to the blow, and in the more powerful hammers an increased striking force is obtained by admitting steam below the piston. The attachment of certain mechanism enables the workman in charge to cause the hammer to fall from any point in its ascent, or to arrest the blow at any point in its descent, thus providing for the striking of blows of various degrees of force. These improvements were due to Mr. Wilson.

STEEL occupies an intermediate position between wrought iron and cast iron; it contains more carbon than the former, but less than the latter, so that it may be prepared from either of those substances, by the addition of carbon to the wrought iron, or by removing the impurities from the cast iron. In the older process for the preparation of steel, which is known as the *cementation process*, the converting chest is filled with alternate layers of powdered charcoal and wrought-iron bars, and the whole is then kept at a red heat for several days, the length of time depending on the services for which the steel is required. At the conclusion of the operation the bars are brittle, and are covered with blisters, from which circumstance the steel thus prepared is known as blistered steel. The *Bessemer Process* is the one more generally employed now. It is carried out in a large pear-shaped vessel called a "converter." Into this a quantity of molten cast iron is run, and a powerful air blast is admitted from below until the whole of the carbon and other impurities have been burnt, a condition of affairs that is indicated by the dying out of the flames at the surface of the molten mass. The blast is then shut off, and molten cast iron, containing sufficient carbon to convert the whole charge into steel, is added. The blast is again turned on for a few moments to ensure that the materials are thoroughly mixed. The contents of the converter are then cast into ingots. These are afterwards heated to redness and beaten or rolled into bars, The capacity of the converter varies from 3 to 7½ tons, and several charges may be dealt with every day. Since the introduction of this process the iron and steel industry has progressed to such an extent as to become, next to agriculture, the most important in the United Kingdom, employing, according to the census returns of 1901, upwards of 216,000 persons.

STEELE, SIR RICHARD, *b.* at Dublin, 1671, *d.* 1729, spent his early life in the army, and resigned his commission in 1706 to devote himself to literature and politics. In 1709 he founded the "Tatler," which appeared three times weekly, and contained brightly written essays on social subjects, the greater number of which were written by Steele. The "Spectator" and the "Guardian" were other literary ventures of the same character, in the production of which he was assisted by his friend Addison. He was also the author of several successful comedies.

STEELYARD, (1) An instrument that provides a ready method of weighing substances without the use of a set of standard weights. It consists of a bar of steel, weighted at one end, so that it balances about a point that is much nearer to the heavier end than to the other. From the shorter arm is suspended a scale-pan or a hook, by means of which the substance to be weighed is supported. A single weight is moved along the graduated longer arm until the steelyard occupies a horizontal position, when the true weight of the substance being weighed is indicated, by the figures marked on the longer arm, at the point at which the constant weight produced equilibrium. (2) The name given to a factory, situated in London, between Thames Street and the river Thames, which belonged to a body of German merchants, known as "Merchants of the Steelyard." They enjoyed various commercial privileges which practically gave them a monopoly of certain branches of trade. They were deprived of their special privileges in 1551, but continued the business of the Steelyard until 1597. The premises remained in the possession of the free towns of Lübeck, Hamburg, and Bremen until 1853.

STEEN, JAN, *b.* 1626, *d.* 1679, a Dutch painter of Leyden, is remarkable for the amount of humour he managed to throw into his pictures. Seizing on some incident in every-day life, he would depict it with a fidelity excelled by Rembrandt alone. His "Doctor Visiting his Patient," and the "Music Master," well illustrate his uncommon gifts. His works are numerous.

STEEPLECHASE, a horse-race in which the competitors have to surmount obstacles, such as hedges and ditches, in order to reach the winning-post. The first race of the kind was run in Ireland by a party of fox-hunters, who actually made a distant steeple the goal of an impromptu race. Such matches soon grew in favour, and steeplechasing became a recognised branch of horse-racing. The various meetings are under the management of the Grand National Hunt Committee.

STEEPLE-JACK, a man who makes it his business to climb steeples and tall chimneys in order to execute repairs.

STEERING, the art of managing a boat or ship so as to keep her head in the required direction. The importance of the steersman's position lies in the fact that even a slight deviation from the proper course makes the journey appreciably longer. The steering is effected by means of a lever suspended perpendicularly in the water behind the vessel, and swinging on an upright in the stern. It is actuated in a boat or small ship by a lever called the tiller, which is a continuation of the rudder forwards into the body of the ship, where it swings in a horizontal plane. In a large ship, the tiller is moved by means of a wheel and connecting chains. In steamships the paddle, or propeller, is largely used to aid in quickly turning the ship.

STENCILLING, a method of printing or executing designs by means of letters or patterns cut out in a thin sheet of metal. The sheet of metal with the letters or pattern cut out, called a stencil, is laid on the surface to be marked, and a brush with the desired colour passed rapidly over it.

STENOG'RAPHY, See *Shorthand*.

STENTOR, in Greek legend, a herald of the Greeks in the Trojan War, whose voice was as loud as that of fifty men shouting together. Hence an unusually loud voice is called "stentorian."

STEPHEN, KING OF ENGLAND, (1135-1154), son of Adela, the Conqueror's daughter, was crowned king on the death of Henry I., to the exclusion of the latter's daughter, Matilda, and her son, Henry. The principle of primogeniture was not yet sufficiently established to make men take Matilda's side as a matter of pure right, so that men sided with her or Stephen as their interest or inclination prompted. The struggle between the two parties went on with varying success till 1153, when by the treaty of Wallingford it was agreed that Stephen should reign during his lifetime and be succeeded by Prince Henry, son of Matilda.

STEPHEN, SAINT, the first Christian martyr, was one of the seven deacons chosen to administer the funds of the early Christians, so as to leave the Apostles free for their more important work of preaching. Our whole knowledge of him is gained from the Acts (vi. and vii.).

STEPHEN, SIR LESLIE, *b.* 1832, *d.* 1904; became as eminent in literature as his brother, Sir James Stephen, was in the law. He was for some years editor of the "Dictionary of National Biography." Of his independent work may be mentioned, "Hours in a Library," and his "Johnson," "Pope," and "Swift" in the "English Men of Letters."

STEPHENS, JAMES, *b.* at Kilkenny, 1824, *d.* 1901; was destined, at forty, to

be spoken of with bated breath, and at seventy-seven, to die unnoticed. As "Head Centre" of the Fenian movement, he showed much skill in organisation and in directing the energies of a secret society. But when action was required, his courage failed him, and he fled to New York. He afterwards returned to Ireland, where he ended his days in obscurity.

STEPHENSON, GEORGE, *b.* at Wylam, near Newcastle, 1781, *d.* 1848, the great improver of the locomotive steam-engine, was one of six children whose father earned twelve shillings a week. In his early years George worked as fireman to a colliery-engine, and spent his evenings in learning to read, write, and calculate. Meanwhile he made a minute study of his engine. His first great step in life was gaining, in 1812, the post of engineer at the Killingworth Colliery. His first engine, "My Lord," was used to draw the coal from that colliery to the sea. He was next appointed engineer on the Stockton and Darlington Railway, opened in 1825, the first to carry passengers as well as goods by steam traction. He gained the prize offered by the directors of the Liverpool and Manchester Railway for the best locomotive, his "Rocket" making the trial trip at the rate of 29 miles per hour. His life henceforward was spent in advising on the numerous railway schemes which soon covered the country with a network. His "safety lamp" the "Geordie," for mines, which some preferred to the "Davy lamp," should also be mentioned.

STEPHENSON, ROBERT, *b.* at Willington, near Newcastle, 1803, *d.* 1859, son of George Stephenson, was born in his father's struggling days. That father, however, sacrificed much to give his son the education he felt the lack of so keenly himself. Robert aided his father in constructing the "Rocket," and became chief engineer of the London and Birmingham Railway. His fame is bound up with the viaducts and bridges he constructed for railways, the High Level Bridge at Newcastle, the Britannia Tubular Bridge over the Menai Straits, and the Victoria Bridge at Montreal, being striking examples. He represented Whitby in Parliament from 1847 till his death. He was buried in Westminster Abbey beside Telford.

STERE, the unit of cubic measurement in the French, or decimal system of Weights and Measures. It is a cubic metre, and equals 35·32 cubic feet.

STEREOSCOPE, an optical instrument for viewing photographs so as to give the appearance of solidity to the resulting picture. Two photographs are taken instead of one, from points distant from one another as far as the centre of one eye is from that of the other. The photographs are then so arranged on a card behind a couple of lenses that each eye sees exactly the picture it would have seen from the original position of the lenses. It was Professor Wheatstone who first suggested the possibility of making stereoscopic pictures.

STEREOTYPING, the process of producing a solid cast of a page of ordinary type. Its utility lies in the fact that it saves the wear of the ordinary movable type, whilst the plates can be kept to produce further copies if required. William Ged, of Edinburgh, invented in 1725 the older, or stucco process. Setting up the page of movable type, he covered the surface with a thin layer of oil. He then poured over it stucco mixed to the consistency of thick cream, and allowed this to harden. The impression was then removed, and baked hard, after which it was ready to give casts in type-metal for printing. The present, or papier-maché process, is practically the same, except that the impression is taken with a pad of carefully-prepared papier-maché. It is the art of stereotyping that has rendered possible the production of newspapers at their present rapid rate.

STERNE, LAURENCE, *b.* at Clonmel, Ireland, 1713, *d.* 1768, was the son of a lieutenant in the English army. After being educated at Halifax Grammar School, he went to Cambridge with a view to taking holy orders. From 1738 to 1759 he worked as a simple country parson at Sutton, near York. In 1760, the production of the first two volumes of "Tristram Shandy" made him famous, and from that time till his death he revelled in his own popularity. In 1762 he published the first two volumes of the "Sentimental Journey through France and Spain." His work is marked by exquisite humour and marred in parts by coarseness.

STETHOSCOPE. See *Med. Dict.*

STETTIN, an important port and manufacturing town of Germany, on the Oder, about 30 miles from the Baltic Sea. One of the chief seaports of Prussia, its imports and exports together amount to about £14,000,000 per annum. The imports include petroleum, dried fish, wine and cotton; the exports consist mainly of sugar, metals, timber, corn, spirits and flour; population about 220,000.

STEVENSON, ROBERT, *b.* at Glasgow, 1772, *d.* 1850, an eminent Scottish engineer whose life was mainly passed in the designing and constructing of lighthouses. His great achievement was the construction of the Bell Rock Lighthouse, off the coast of Forfarshire, a task hitherto deemed impracticable. He invented the "flashing" and "intermittent" system of lighting. His works on engineering were highly thought of in their day.

STEVENSON, ROBERT LOUIS, *b.* at Edinburgh, 1850, *d.* at Samoa, 1894, was one of the most engaging writers of the 19th century. Grandson of the famous engineer, Robert Stevenson, he was trained for the same profession, but his physical strength was not equal to the necessary strain. He turned nominally to the bar, but it was soon seen that authorship was his vocation. After writing many essays and articles of high merit, he sprang into the front rank of romance writers with his "Treasure Island," which was followed by many stories of almost equal charm. His chief works include "Virginibus Puerisque," "Dr. Jekyll and Mr. Hyde," "Kidnapped," and "The Master of Ballantrae." His "Child's Garden of Verse" also made a favourable impression when it appeared.

STEWARD, LORD HIGH. Refer to *Index.*

STILL, an apparatus for distillation, i.e. for converting a liquid into vapour, and then again condensing it. It consists of a boiler, a neck, a condenser, and a receiver, and the size and material of these depend on the nature and quantity of the liquid to be operated on. It may be used to separate a liquid, say water, from its impurities, as we do in a chemical laboratory, or one liquid from another by taking advantage of their different boiling points, as in a distillery, but in both cases the principle is the same.

STILTON, a small village in Huntingdon county, 6 miles from Peterboro'. It gives its name to a favourite English cheese, which is, however, mostly made in Leicestershire.

STIVER, an old Dutch coin equivalent to a penny, being the one-twentieth part of a guilder. A new system of Dutch coinage came into force in 1875 (Refer to "Coinage" in *Index*).

STIRLING, is strikingly situated on the river Forth, about 30 miles from Edinburgh. The castle, standing on an eminence some 300 feet above the surrounding plain, is a landmark for miles around, and has been the scene of many important events in Scottish history; while Bannockburn, Cambus-Kenneth Abbey, and the Abbey Craig, on which stands the Wallace Monument, are within easy distance; population 18,000.

STOCK EXCHANGE, a market for the purchase and sale of stocks and shares of every description. Every commercial city of importance has now its stock exchange, and in the main their features are alike. The London Stock Exchange is a large building in Capel Court, near the Bank of England. The present building dates from 1801; previous to that business was transacted partly in a room of the Bank of England, and partly in the streets near it. Refer to "Stock Exchange" in *Index.*

STOCKHOLM, the capital and largest town of Sweden, stands on some islands, and on both sides of the channel by which Lake Malar pours its waters into the Baltic. The situation is one of the most picturesque in Europe, and it has also the advantage of being exceedingly healthy. Founded in 1255, it is only in recent times that Stockholm has been recognised as the capital of Sweden, but in size and importance it far surpasses all its competitors. Its population has increased from 75,000 in 1800 to 300,000 at the end of the century. The exports, consisting chiefly of iron, timber, and copper, do not amount to £2,000,000 a year, but the imports, mostly from Germany, though largely from Britain, amount to nearly £8,000,000.

STOCKPORT, in Cheshire, 6 miles south of Manchester, is a town of ancient date owing its present importance mainly to its manufacture of cotton. There are also important foundries and machine works. (For population, etc., see p. 902.)

STOCKS, (1) A vertical framework of timber with holes to receive the feet of offenders sentenced to this punishment. They are mentioned so early as 1350, and their use has only died completely out during the last fifty years. Stocks may be seen in many a village and country town. (2) Money lent to the Government or to some public body, at a certain rate of interest, or used in the establishment of some industrial concern. In all these cases, the actual money is not recoverable, but the investor can sell his right to the interest or dividends that accrue from the investment. Refer to "Stock" in *Commercial Dictionary.*

STOCKTON-ON-TEES, a seaport of Durham, near the mouth of the Tees. All kinds of iron and steel construction, including ship-building, are carried on; coal is exported, and there are large potteries. The first railway for passengers was opened from Stockton to Darlington in 1825; population, including that of South Stockton, about 75,000.

STOICISM, the state of mind and the outward behaviour usually supposed to characterize the *Stoics.* The latter were a school of philosophers founded by Zeno at Athens about 300 B.C. The gist of their moral teaching was that man can rise nearer and nearer to the divine, in proportion as he frees himself from the bondage of bodily passions and human emotions, only allowing himself to be swayed by what his reason approves. Among the Romans the Stoic system of philosophy was in great repute, Cato, Cicero, Brutus, and Seneca, being among its upholders.

STONEHENGE, a remarkable assemblage of huge stones on Salisbury Plain, in

Wiltshire, 7 miles north of Salisbury. When entire it consisted of two circles of stones, many of which are now lying on the ground. Those remaining in position show that the general arrangement was two upright stones joined by a third, which they supported. The largest of the stones is 22 feet high, 7½ feet broad, and 4 feet thick, and as they cannot have been quarried in the neighbourhood, it is not easy to understand how they were brought and set up. Their erection is generally attributed to the Bronze Age, and their use was probably both monumental and religious.

STONES, PRECIOUS. The greater number of precious stones are of mineral origin, but pearls, red coral, and amber, are usually included in a list of them. Classifying the precious stones in order of value, we should name first the diamond, ruby, sapphire, amethyst, and emerald; next to these would come the topaz, garnet, turquoise, opal, onyx, chalcedony, cornelian, agate and jasper; while a long list of stones very beautiful, but hardly scarce enough to be classed as "precious" would include moonstone, lapis lazuli, malachite, and cairngorm. Many eminent scientists have attempted to produce precious stones artificially but hitherto without success.

STOOL OF REPENTANCE, an elevated and conspicuous seat, sometimes called the "cutty-stool," in front of the pulpit in Scottish churches, on which offenders against the moral law were made to sit during Divine Service. It went out of use towards the end of the 18th century.

STORK, a genus of wading bird very common in some Continental countries, as Holland and Germany, but rather rare in Britain. They are about 4 feet in height. They love to haunt marshy places, where they feed on small fish, eels, frogs, etc., but they also do great service in towns where they are protected, by eating up the offal and garbage. They are much attached to their young. They are migratory birds, coming to Europe in spring, but spending the winter months in warmer countries.

STOTHARD, THOMAS, *b.* in London. 1755. *d.* 1834; painter and designer, was hardly out of his teens when he found himself full of engagements to produce designs for books. He became, however, a student at the Royal Academy, and in time its librarian. His designs number four or five thousand, his pictures about one hundred, of which the "Canterbury Pilgrims" and the "Flitch of Bacon" are the best known.

STOW, JOHN, *b.* 1525, *d.* 1605; was intended for a tailor, but his genuine love of knowledge led him to devote himself to surveying the past and relating it as truly as he could. He travelled much, examining and collecting manuscripts and documents. He published "Summary of English Chronicles." "Chronicles of England," and "Survey of London and Westminster."

STOWE, MRS. HARRIET BEECHER, *b.* 1811, *d.* 1896, the gifted American authoress of "Uncle Tom's Cabin," and other anti-slavery publications. She was a sister of the celebrated preacher, Henry Ward Beecher. She lived for many years at Cincinnati, Ohio, where she befriended the slaves who escaped from Kentucky. In 1852 she published her great work, and followed it by others, insisting on the evils of slavery, and in this way did much to stimulate public opinion in favour of the abolition of slavery in the United States.

STRADIVARI, ANTONIO, *b.* 1649, *d.* 1737; the great violin maker of Cremona, whose work has never been surpassed and probably not equalled. In early life he assisted Nicholas Amati, whose designs he improved and perfected. A violin by Stradivari will fetch from £400 to £2000. He made other instruments as well.

STRAFFORD, (Thomas Wentworth), **EARL OF,** *b.* in London, 1593, *d.* 1641, was the son of Sir Richard Wentworth, the representative of one of the oldest families in Yorkshire. Clever, rich, and well-educated, he was just the man to lead the Commons of England in their resistance to the king's encroachments, and this he did until the Petition of Right was passed, 1628. From that time he devoted himself to the king's interest, and was soon rewarded by being made Baron, then Lord Wentworth, and finally Earl of Strafford. The work he did for Charles fully earned his elevation; he made Charles more truly king in Ireland than any of his predecessors had been. His policy and character are best summed up in the word "Thorough." The first work of the famous Long Parliament was to impeach Strafford, but they soon had recourse to a bill of attainder. This was soon passed, and Charles broke his plighted word by allowing it to become law. Strafford died on Tower Hill with the words "Put not your trust in princes" on his lips.

STRAITS SETTLEMENTS. Refer to *Index.*

STRASSBURG, an important fortified town, capital of the German province of Alsace-Lorraine, which was ceded by France to Germany after the war of 1870-71. It stands on the river Ill near its confluence with the Rhine, and its strategic importance is enormous. Founded by the Romans, it saw many a struggle between them and the Germans. Later, as a "free town" of Germany, it acquired great importance, as a centre of trade and of learning. It was in the hands of the French from 1681 to 1871. The Cathedral may well be called one of the wonders of Europe, and the university is an important one. Strassburg is a place of great trade and varied manufactures; population 150,000.

STRATEGY, the art of generalship in its widest sense. As "strategy" is often confounded with "tactics," it way be well to state that strategy is the conduct of operations before, and leading up to, the battle, while tactics means the conduct of the battle itself. Thus it was the strategy of Wellington that alone wore out the French in Spain by preparing such a place of refuge in the lines of Torres Vedras that he could always choose his own time for fighting, while his tactics in opposing the "thin red line" to Napoleon's column formation enabled him to win Waterloo, the only battle in which they met.

STRATFORD DE REDCLIFFE, VISCOUNT. See *Canning, Stratford.*

STRATFORD-UPON-AVON, the birthplace of Shakespeare, is a pleasant little town in Warwickshire, 8 miles south-west of Warwick. The house in which the poet was born still stands; it has been made national property, and is used as a Shakespeare museum. The church contains the poet's grave with the well-known bust and still more famous inscription.

STRATHCONA (Donald Alexander Smith), **BARON,** *b.* at Forres, in Scotland. 1820, entered early in life the service of the Hudson Bay Company, of which he became the chief executive officer in Canada. He had the chief hand in the development of Manitoba and in bringing to a successful issue the construction of the Central Pacific Railway. He was created a peer in 1897. In the Boer War he raised, equipped, and transported to South Africa, at his own expense, a mounted infantry force of 600 men. These, known as "Strathcona's Horse," gained a great name. He and his cousin, Lord Mount-Stephen, have given £360,000 towards the erection and maintenance of a hospital at Montreal, as a memorial of the Queen's Jubilee (1887), and in 1902 King Edward's London Hospital Fund received from them an endowment of £16,000 per annum.

STRATHFIELDSAYE, a village 7 miles north of Basingstoke, in Hampshire. Here is situated the fine estate of that name bought in 1817 for £263,000, and presented to the Duke of Wellington by Parliament. Near it is Silchester, where most interesting Roman remains have been found.

STRATHMORE, a wide fertile valley or plain extending right across Scotland from about Dumbarton, on the Clyde, to Stonehaven in Kincardineshire.

STRATHNAIRN, LORD. See *Rose, Sir Hugh.*

STRATHSPEY, a kind of dance that originated in the valley of the Spey, in Scotland, whence its name. It is like the reel, but is more irregular in motion. Many of Burns's songs are adapted to the music of the Strathspey.

STRAUSS, DAVID FREDERICK, *b.* in Würtemberg, 1808, *d.* 1874; was educated for a pastor, but became a professor at Tübingen University. His "Leben Jesu," or "Life of Jesus Critically Examined" (1835) opened a new era in Bible criticism, and the rest of his life was spent chiefly in answering his adversaries.

STRAUSS, JOHANN, *b.* 1804, *d.* 1849; the son of an innkeeper at Vienna, early showed a musical talent that would not be denied. His success as a conductor at the "Sperl" in Vienna was followed by successful tours abroad. He composed dance music of a high order. His son Johann (1825-1899) has been as successful a composer and conductor as himself.

STRAW-PLAIT, a plait or braid made usually of a special kind of wheat-straw. The best straw for the purpose in England is that of the wheat grown in Bedfordshire and the neighbouring counties. The wheat is pulled, not mown, and after the ears are removed, the straw is cut into lengths. For hats the whole straw is used, but for bonnets it is cut into four or more strips. The making of straw-plait used to give employment to thousands of women and children in and around Luton and Dunstable, but most of the plait now used comes from China, the best, as formerly, from Leghorn in Italy. The straw-plait industry still flourishes at Luton, but it consists chiefly in the sewing, partly by hand and partly by a special machine, the plaits to form bonnets and hats.

STROMBOLI, one of the Lipari Islands, off the north coast of Sicily. The volcano on this island, rising to a height of over 3,000 feet, is in an almost constant state of eruption, sending up steam, and occasionally showers of stones, which, however, usually fall into the crater again. The island, with an area of about 9 square miles, supports a population of over 1,000, occupied in producing wine, wheat, cotton, raisins, and currants.

STRONGBOW, RICHARD. See *Clare, Richard de.*

STRUTT, JOSEPH, *b.* 1749, *d.* 1802; artist and antiquary, was an enthusiast in antiquarian pursuits. His profession as engraver aided him to produce his valuable works on English customs and manners. "The Regal and Ecclesiastical Antiquities of England" was his first book; "Sports and Pastimes" his last. He died in comparative poverty.

STRYPE, JOHN, *b.* 1643, *d.* 1737; an ecclesiastical writer, was educated at

St. Paul's School and at Cambridge. He wrote lives of the principal Reformation leaders, as Cranmer, Parker, and Whitgift; also "Ecclesiastical Memorials," a history of church matters under Henry VIII., Edward VI., and Mary.

STUBBS, WILLIAM, *b.* at Knaresborough, 1825, *d.* 1901, a great historian of the 19th century, and bishop of Oxford. After a brilliant career at Oxford he took Holy Orders, and was for some years rector of Navestock, in Essex. In 1866 he became professor of modern history at Oxford, and held the post until, in 1884, he was made a bishop. His work is characterised by accuracy and lucidity. The "Constitutional History" is his best known work, but a large number of other valuable historical works are the result of his labours and learning.

STUD-BOOK, a book containing the pedigree of animals of famous breeds, especially of horses. That for race-horses dates from 1808, and is the book kept by Messrs. Weatherby, the official agents of the Jockey Club. There are also stud-books for collies, St. Bernard dogs, and special breeds of cattle, etc.

STURDY, or **THE GID,** is a disease that affects young sheep and cattle. They seem to lose control over their motions, turn round and round, and cannot take their food properly. It is caused by the presence of a bladder-worm in the brain, which may be removed with care and the animal may recover. It is remarkable that the disease is hardly known where dogs are scarce.

STURGEON, a large fish of which there are two or three distinct species found in the seas round Europe. The most common, from 6 to 10 feet long, is often caught in the seas and estuaries of Britain, especially in the Bristol Channel. A smaller one, called the sterlet, from 4 to 6 feet long, is found in the Black and Caspian Seas, as well as a much larger one, reaching sometimes a length of 25 feet. The sturgeon fishery of the Volga and the Caspian Sea furnishes material for the preparation of caviare and isinglass.

STUTTGART, the capital of the kingdom of Wurtemberg. Though one of the oldest towns of Germany, it has few ancient buildings, but many handsome modern ones. Its art collections and its library are famous, while its academy of music is of a very high class. Stuttgart is an important book-publishing town, and in various other industries, as the making of machinery, chemicals, musical instruments and sugar, it holds a high place.

STYLE, OLD AND NEW. The Old Style, a term used often in mentioning dates previous to 1752, means that the number of the year is not altered so as to bring it into accordance with the present method of reckoning the years. The year 1752 was ordered to begin on the 1st of January, whereas the year had previously begun on March 25th, so that the 20th of March preceding that of 1752 would be 1750 or 1751 according as you reckon it by the Old or New Style. See *Calendar*.

STYLITES. See *Pillar-Saints*.

STYX, in classical mythology the chief river of the infernal region, round which it flowed seven times. All shades had to cross this river, and Charon, the boatman who ferried them across, charged an obol for the service. Hence the necessity for placing this coin in the mouth of the dead.

SUAKIM, a small town on the west side of the Red Sea. It is the chief port for Egyptian Soudan, and its trade is steadily increasing. The British occupied it as a strategical point after the Mahdi's rising, and an Anglo-Egyptian garrison is still kept there. The harbour is the best in the Red Sea, but it is small and has a narrow, winding entrance; whilst the surrounding country is arid and bare. Many Moslem pilgrims embark here for Jeddah, the port of Mecca; population about 10,000.

SUBLIMATION, the process of turning solid substances into vapour by means of heat, and again solidifying them by cooling. The process is easily seen by heating a little Iodine in a flask or test-tube. Many chemicals are refined by this process, the impurities being left behind.

SUBLIME PORTE. See *Porte, Sublime*.

SUBMARINE BOATS. From time to time, during the past 150 years, attempts have been made to construct a boat that could be navigated beneath the surface of the water, but no practical result was attained until 1887, when an American engineer experimented with a submarine boat on the Hudson River, and demonstrated that it was possible to run the boat on the surface of the water, to cause it to dive and ascend again at will, and to steer it in any desired course when submerged. Mr. Nordenfeldt patented another, and constructed several for use as torpedo boats. The latest type is that known in the British navy as the "A" class. The later boats are an improvement on the first of the class, which met with disaster when manœuvring off the Isle of Wight, in February, 1904. They are built of steel, somewhat in the shape of a fish. When on the surface there is a small, narrow deck clear of the water, and above this rise a cylindrical conning tower, the periscope tube, and a temporary bridge, which is struck when the boat is about to dive. Admission into the interior is obtained only through a small hatch in the top of the conning tower which is closed by screws. When a boat is to be brought into operation, the first requisite is to find her "diving trim." This is done by careful experiment while the boat is stationary. Water is admitted into the ballast tanks until the buoyancy is so much reduced that the boat remains just hovering on the surface with her deck awash. Pressure gauges indicate when the buoyancy has been sufficiently reduced, and a clinometer shows whether the boat is sinking on an even keel. Any failure in the latter direction is rectified by admitting water to compensation tanks placed fore and aft. When the diving trim has been found, the officer in charge notes the exact amount of water admitted into each tank, and is thus in a position to repeat the operation quickly should occasion arise. The tanks are then blown out by means of compressed air, and the boat rises again to the surface, the operation serving as a test that the air-tubes and valves are in working order. Diving takes place while the boat is in motion. Her buoyancy having been sufficiently reduced as described above, the movement of a horizontal rudder inclines her head slightly downwards, and she proceeds on this line until a sufficient depth has been reached, when the rudder is restored to its normal position, and the boat travels on a horizontal keel. Usually the depth attained is not greater than will permit the top of the periscope to remain above the surface. The reflector in this may be turned in any required direction, and any object to which it is directed is focussed on a camera-obscura table below the tube. When the periscope is submerged the crew are in darkness with regard to their surroundings, except that the shadow of any large object in the immediate vicinity, may be seen through one of a number of glass lights placed round the upper edge of the conning tower. When travelling at the surface, these boats are capable of attaining a speed of from 12 to 15 knots, the screw being driven by gasolene engines. The submerged speed is about two-thirds of the surface speed, and the motive power is obtained from electric motors. Sufficient compressed air is carried to maintain the crew in comfort for six hours. Each boat is supplied with two torpedoes. When one is discharged, the delicate balance of the boat is maintained by admitting into a special tank an equal weight of water.

SUBPŒNA, a writ issued in the King's name to a witness directing him to appear under a penalty (*sub pœna*), and state what he knows of the case in question. The witness must be allowed a reasonable time to provide for his absence from his own affairs, and his travelling expenses must be paid beforehand. If the person summoned wilfully fails to appear, he is liable to be sued for damages, or to be imprisoned for contempt of court.

SUCCESSION ACTS. The English Parliament early claimed and exercised the right to limit and direct the succession to the Crown. The Revolution of 1688 proceeded on the assumption that James II. had, by fleeing the kingdom, abdicated the throne, and therefore left it open to Parliament to choose and name his successor. Finally, in 1701, it was enacted that, if William and Anne left no heirs, the Crown should pass to the next Protestant heir, Sophia of Hanover, and her Protestant descendants, and that whoever came to the Crown should "join in communion with the Church of England as by law established."

SUEZ, a small Egyptian town at the head of the western of the two branches into which the Red Sea divides at its northern end. It presents a very ill-kept appearance, and the buildings are mean; population about 17,000.

SUEZ CANAL. That only 70 miles of land should prevent ships sailing straight from the Mediterranean to the Red Sea, had always seemed a deplorable fact. The Overland Route, opened in 1837, by way of Suez, solved the difficulty as far as passenger traffic was concerned, but merchandise could not be conveyed that way because of the expense. About 1850, M. de Lesseps, a French engineer, having convinced himself that the construction of a canal was feasible, set about persuading others, and with such success that by 1860 he had raised the necessary capital, and begun the work. The Canal was opened in 1869, and soon began to revolutionise the trade with India and the East. The English had not much share in the Canal at first, but in 1875, the Khedive offered his holding for sale, which the British Government bought up, and thus became owners of nearly half the Canal stock. The Canal saves about 4,050 miles in a journey to India and the East, but the heat encountered there and in the Red Sea to some extent discounts the advantage.

SUGAR, a crystalline substance obtainable from the juice of many plants, but especially from the sugar-cane, beetroot, and (in Canada) maple-tree. Sugar is a compound of carbon, hydrogen, and oxygen, in varying proportions. The sugar-cane, a native probably of India, is now grown in most tropical and sub-tropical countries. It produces the best sugar, and was, in fact, practically its only source till Napoleon Bonaparte gave an impetus to the manufacture of beet-sugar. The United States, West Indies, Brazil, Mauritius, and East Indies are our chief sources of cane-sugar; France, Germany, and Austria supply the bulk of the beet-sugar.

SUICIDE, the killing of oneself. In law, a person is counted a suicide (*felo de se*) if he dies through committing any felonious

act, though it was not intended to bring about his own death. If two agree to commit suicide and one survive, the latter is accounted a murderer. In former days a suicide was interred at cross-roads, with a stake through his breast, and his personal property was forfeited to the Crown. The latter penalty was abolished many years ago, and the former in 1823. Suicide statistics furnish some curious facts, one of the most remarkable being that more men commit suicide than women in the proportion of more than two to one.

SULLIVAN, SIR ARTHUR, *b.* in London 1842, *d.* 1900, was the son of Thomas Sullivan, bandmaster at Sandhurst, and afterwards at Kneller Hall. The boy was musical in every fibre of his being. Chorister at the Chapel Royal, student at the Royal Academy, and afterwards at the Conservatoire of Leipzig, he absorbed the principles and practice of his art so thoroughly that at twenty he successfully produced his important musical work "The Tempest." For the next ten years he was engaged in conducting and composing with increasing success; and then, in 1872, with "Trial by Jury," began that delightful string of operettas which made his name and that of W. S. Gilbert, famous. "H.M.S. Pinafore," "The Pirates of Penzance," "Iolanthe," "The Mikado," and many others, each in turn seemed perfect and unapproachable in its kind. His "Golden Legend" testifies to his ability as a serious composer.

SULLY (Maximilian de Bethune), **DUKE OF,** *b.* 1560, *d.* 1641; one of those single-eyed personages that flit but rarely across the pages of history. Throughout the reign of Henry IV. of France he was the king's chief adviser. It was he who advised Henry to accept the Catholic faith, and he brought the country from bankruptcy to prosperity by his rigorous examination of accounts.

SULPHUR, an elementary substance found both free and in combination in many parts of the world, generally in volcanic districts. The greater part of the sulphur used in Europe comes from Sicily. The various changes undergone by sulphur by continuous heating are very interesting, and the experiment is easily made, only a test-tube being required. The uses of sulphur and its compounds are many and important; the match manufacture and that of gunpowder being examples. The fumes of burning sulphur form a powerful bleaching agent, much used to bleach straw, silk, wool, etc.

SULPHURIC ACID, a compound of sulphur, oxygen, and hydrogen, of the form commonly known as Oil of Vitriol. So important is this acid from the extent to which it is used in the arts and manufactures, that we may estimate, it is said, the commercial importance of a country from the amount of sulphuric acid it consumes. The alkali manufacture, the making of soap, glass, glue, and bleaching powder, depend on sulphuric acid. The acid is of rare occurrence in nature, but sulphates are numerous and important. The manufacture of sulphuric acid is a complicated process, starting with the combustion of sulphur.

SUMATRA, a large island having an area of 170,000 square miles, lying south-west of the Malay Peninsula, and separated from it by the Malacca Strait. Though 1,100 miles in length, its greatest breadth does not exceed 250 miles. The mountains which run parallel to, and near the west coast, attain a height of 11,000 feet, and include many still active volcanoes. The island is rich in vegetable and animal forms; rice, sugar, coffee, pepper, sago, and tobacco being easily grown, while tropical trees abound. The population is mainly of Malay origin, but in varying degrees of civilization. Since 1620, when the Dutch East India Company began to settle here, they have gradually extended their sway, until now they rule all the coast districts, and a good deal of the interior; total population exceeds 3,000,000.

SUMPTUARY LAWS, laws passed at various times, and in various countries, to prevent extravagant expenditure on banquets, dress, and other forms of personal luxury. The fact that such laws were found useless among the Romans and Greeks did not prevent the English Parliament from making them, and from Edward II. to Henry VIII. they were repeatedly passed, and as constantly evaded. Most of our sumptuary laws were repealed in the reign of James I.

SUN, THE, the body from which we derive heat and light, the director and controller of the earth in its annual course, is distant from us about 93,000,000 miles. Its diameter is about 864,000 miles and its density about ¼ that of the earth. It is a globe of matter consisting of elements corresponding to those which form the earth, but so hot as to be in a gaseous state, covered with a sort of brilliant, cloudy envelope formed by these vapours condensing through radiation. At times, through an up-rush of heated gas from below, or a downfall of the condensed particles, this brilliant envelope, the *photosphere*, is broken, and we get a glimpse of the gaseous interior, and say there are "sunspots" visible. Outside the photosphere is a gaseous layer called the *chromosphere*, and outside that again is the *corona*, best seen in eclipses. The mass of the sun is about 720 times that of all the planets taken together, so that the centre of gravity of the solar system must lie somewhere near its centre.

SUNDAY, an old Anglo-Saxon word denoting that this, the first day in the week, was set apart for the worship of the sun, one of their divinities. From very early times, Christians formed the habit of meeting on this day for prayer, for exhortation, and for the "breaking of bread," and from the beginning of the 4th century its observance has been enforced by law. The number of statutes dealing with what may, and what may not, be done on a Sunday is large, and some of them are very difficult to enforce.

SUNDERBUNDS, a low-lying district in the lower part of the Delta of the Ganges formed by the alluvial deposit brought down by that river. It is a marshy, almost uninhabited district, abandoned mostly to wild animals, among which the tiger and crocodile are conspicuous. The climate is dangerous to Europeans, but a few natives are found, occupied either in rice-growing, or in wood-cutting.

SUNDERLAND, a prosperous seaport and manufacturing town at the mouth of the Wear, in the county of Durham. In shipbuilding, Sunderland is running Glasgow close, and it has numerous other manufactures, such as chemical works, glass-making, anchor and chain factories, and iron works. Its imports and exports together total annually £3,000,000. (For population, etc., see p. 902.)

SUN-DIAL. See *Dial.*

SUNNITES, the orthodox Mohammedans, who believe in the *Sunna* as well as the Koran. The *Sunna* is a body of traditions relating to Mohammed and his teaching, and is rejected by the Shiites, the other great section of Mohammedans. The Mohammedans in Persia are the chief Shiites, the inhabitants of most other Mohammedan countries being Sunnites.

SUPERIOR, LAKE, the largest body of fresh water in the world, has an area of 31,200 square miles, equal to that of Ireland. It lies between Canada and the United States at an elevation of 600 feet above the sea. Its water is very pure and transparent, and it never freezes over. It abounds in fish, and the land round its shores is rich in copper. The navigation is dangerous owing to frequent and sudden storms. The boundary line between Canada and the United States passes nearly through its centre.

SUTTEE, the practice, once not uncommon among Hindoo widows, of sacrificing themselves on the funeral pile of their deceased husbands. Up to 1829 the practice was allowed by the English government, provided the act was perfectly voluntary. It is now rarely attempted.

SWABIA, an ancient duchy in south-west Germany, which used to stretch from the Rhine on the W. and S. to Franconia and Bavaria on the N. and E.

SWALLOW, a widely distributed genus of migratory birds, divided into about sixty species, of which three visit the British Islands. They have long wings, short legs and feet, and generally a forked tail. The Common Swallow builds its nest in chimneys, or similarly sheltered situations; the House-Martin under shelter of an overhanging rock, or the eaves of a house; and the Sand Martin makes for itself a little cave in a bank of sand. They all live on flies and other small insects, which they catch while on the wing. They arrive in April, and depart about the middle of October.

SWAN, the most graceful of the Duck family, has only one species, the common Swan, that makes its home in the British Isles, but one or two other kinds visit our shores for the winter, departing northward at the approach of summer. The swans on the Thames belong either to the Crown, or to some of the City Companies, and the ceremony of marking them each year (*swan-upping*) is observed with great care. The swannery at Abbotsbury, near Weymouth, is celebrated, some hundreds being kept there.

SWAN, SIR JOSEPH WILSON, *b.* at Sunderland, 1828, invented the autotype process in photography, bromide paper, and the incandescent electric lamp, 1879. He was knighted in 1904.

SWANSEA, a large seaport and manufacturing town of South Wales. It is the most important copper-smelting centre in the world, much of the ore being imported; it has also an important industry in the manufacture of tinplates, besides iron, chemical and lead works. The imports consist chiefly of various ores, timber, and provisions; the exports of tinplates, coal, iron, copper, and other metals. Some of the old town still remains, notably a good part of the castle; population 96,000.

SWEATING SICKNESS, a violent and rapid epidemic which broke out in England in 1485. It consisted of an intense sensation of heat at first, followed by profuse sweating and intolerable thirst, while to drink anything cold was certain death. It broke out again at intervals till 1551, both in England and on the Continent, where it was called the "English Sweat."

SWEATING SYSTEM, a system under which a large manufacturer, say of clothes, boots, or furniture, gives work out to be done for a fixed price without regard to where it is done, who does it, or what pay the actual worker gets for his work. It is difficult to say where "contracting" ends and where "sweating" begins, but, speaking broadly, when a person gives out work under the above conditions, he

is a sweater or an aider and abettor of sweating.

SWEDEN, one of the largest countries of Europe, forms with Norway the peninsula of Scandinavia. Between 1814 and 1905 they were united under one king, but the union is now dissolved. The land rises gradually from the Baltic westwards, until we come to the highest ridge of the Scandinavian Mountains, which forms the common boundary of the two countries. The lakes are a feature of the country, Wener (2,014 square miles), Wetter, and Mälar in the south-east being the largest. Stockholm, the capital, is on Lake Mälar. Copper and iron are the chief minerals, the coal being of a poor quality. The chief export of Sweden is timber; then come iron and farm-produce. The imports are manufactured goods (cotton, woollen, and iron), coffee, sugar, coal, and raw material for her own growing manufactures. Next to Stockholm, the chief towns are Gothenburg and Upsala.

SWEDENBORG, EMANUEL, *b.* at Stockholm, 1688, *d.* in London, 1772, a great scientist and writer on religious subjects. Till 1743 he devoted his attention almost wholly to science, in which he achieved notable results. But in the latter year a great change came over him. He was in London, and he had, he says, visions in which most remarkable truths were revealed to him. Of his sincerity there can be no doubt, and the books in which he makes known his doctrines are marked by a highly spiritual tone.

SWIFT, JONATHAN, *b.* at Dublin, 1667, *d.* 1745, Dean of St. Patrick's, Dublin, was one of the keenest satirists the world has seen. Born and educated in Ireland, though of English parents, he was for some time secretary to Sir William Temple, the great statesman and diplomatist, during which time he published his "Tale of a Tub," and the "Battle of the Books," the former alone sufficient to ensure him undying fame. For many years after this he was employed in political writing, both by the Whigs and Tories, but the comparative leisure of the Deanery enabled him also to produce his celebrated "Gulliver's Travels." The last few years of his life were saddened by brain disease.

SWINBURNE, ALGERNON CHARLES, *b.* in London, 1837, the most striking and original poet of the last few decades, was the son of Admiral Charles Swinburne. Educated at Eton and Oxford, he early showed his poetic genius. The novelty of his versification caused almost alarm at first, but it did good work in freeing poetry from the "iambic chains" that had held it so long.

SWINDON, in the north of Wiltshire, owes its importance to the presence of the Great Western Railway engineering works, in which about 10,000 men find employment; population 45,000.

SWISS GUARDS, a body enrolled in the 17th century for the special protection of the French king's person. Left without directions when Louis placed himself in the hands of the National Assembly, they defended the Tuileries against the revolutionaries for some time, and were then butchered in detail as they retired in obedience to the king's commands.

SWITHIN, SAINT, Bishop of Winchester from 852 to 862, was a man of great piety and charity. Many stories of his kindness of heart are related. The story of the rain preventing his bones from being moved after his canonization, is an invention of later times, and we find similar beliefs about rainy saints' days in other countries. St. Swithin's day is July 15th.

SWITZERLAND, one of the small countries of Europe, having an area of 16,000 square miles. It is one of the few countries that have no access to the sea, having Germany, France, Italy, and Austria on its respective north, west, south, and east sides. The diversified nature of its surface, besides giving variety to its products, offers scenery which attracts the world and has for centuries proved the source of freedom to its inhabitants. Since they expelled the Austrians at the beginning of the 14th century, the Swiss have maintained their freedom, and it is now guaranteed by the great Powers. Having practically no coal or metals, Switzerland can never excel in great manufactures, but the skill and ingenuity of its inhabitants in the lighter arts are admirable. The Swiss, about 3,000,000 in number, use German or French as their native tongue, though most of the educated classes speak both. Bern, the capital (population 64,000), stands on the river Aar; Zurich (150,000), Geneva (105,000), and Basle (113,000), are the next most important towns.

SWORD, a weapon consisting of a blade and handle, the former being now generally adapted either for cutting or thrusting, and the latter furnished with a guard to protect the wielder's hand. The use of the sword goes farther back than the use of the pen; we find representations of them on the earliest Assyrian monuments, and actual bronze examples in some Etruscan tombs and at Mycenae. Sword-making used to be, and still is, a fine art; the steel has to be so exactly tempered that the production of reliable swords by machinery is impossible.

SWORD-FISH, owes its name to a prolongation of the upper jaw, sometimes 3 feet in length, and forming a weapon so formidable as to enable it to attack whales with deadly effect. So powerful indeed is its stroke, that it has been known, in attacking vessels (mistaken no doubt for large fish), to pierce through copper sheathing and oak plank to a depth of 10 inches. The part of the sword that penetrates a ship's side is usually broken off and remains in the timber. In the tropics this fish is from 12 to 15 feet in length. In the Mediterranean, where the capture of sword-fishes, by harpoon or net, is a regular industry, the average weight is about one cwt. Their flesh is highly prized for the table.

SYBARIS, one of the numerous towns founded by Greek colonists in Southern Italy. It was founded about 720 B.C., and soon rose to such a pitch of wealth and luxurious living as to become a by-word; and even now "Sybarite" denotes a man exclusively devoted to luxurious pleasures. It was destroyed in 510 B.C., by the people of Croton, who captured it.

SYDNEY, (1) the capital of New South Wales, the oldest city in Australia, stands on the southern shore of Port Jackson, one of the finest harbours in the world. On January 26th, 1788, Captain Philip landed here the first load of convicts, and thus started the colonization of the continent. The city has now over 500,000 inhabitants, many of whom are engaged in the various manufactures fostered by the coal found in the colony. (2) The chief town of Cape Breton Island, on a spacious harbour. It has productive coal-fields and large iron-smelting and steel works. It is the eastern terminus of the Intercolonial Railway, which links the eastern districts to Montreal, and so to Western Canada; population 10,000.

SYLLABUB, a light dish consisting of whipped cream and sugar, or white of egg and sugar, and flavoured with wine, brandy, or lemon, according to taste.

SYLLABUS, an abstract of a book, lecture, series of lectures, or subjects of examination; a table of contents. The name is especially applied to a document issued by Pope Pius IX. in 1864, containing a list of errors to be avoided by Roman Catholics.

SYLLOGISM, a series of three statements, the third of which depends on the other two. Directly you admit the truth of the first two, called *premisses*, the truth of the third, called the *conclusion*, necessarily follows: e.g., (1) All men are mortal, (2) Cæsar is a man, (3) therefore, Cæsar is mortal.

SYLPHS, a term adopted by the fantastic followers of Paracelsus (1493-1541), to denote a kind of being intermediate between men and spirits. By Pope, who introduces them into his "Rape of the Lock," they were depicted as so graceful in figure that the name has ever since denoted a girl of particularly graceful form.

SYMBIOSIS (Gr. "living together"). See *Commensalism.*

SYMONDS, JOHN ADDINGTON, *b.* in London, 1840, *d.* at Rome, 1893; an eminent literary writer and critic, was educated at Harrow and Oxford. He did much to further the study of the Renaissance period, and his books on "The Renaissance Period in Italy" form his most important production. His poetry shows, perhaps, more polish than genius.

SYMPHONY. Refer to *Glossary of Musical Terms.*

SYNAGOGUE, the building in which the Jews met for worship and religious instruction, or the congregation assembled for that purpose. The general order of the service was regulated by "the rulers of the synagogue," who called on fit persons to read and expound the law. The "minister" was the attendant who had charge of the sacred volumes. The principal service was held each Sabbath morning, and included prayer, the reading of lessons from the law and the prophets, and an address based on the passages read. The synagogue was chiefly regarded as a school of popular instruction in the law, with which it was the duty of every Jew to be well acquainted.

SYNDICATE, a body of men chosen to carry out some special business. The Senate at Cambridge University calls its various committees "Syndicates." But the word is more commonly understood to mean a body of capitalists who have combined to carry out some operation too great or too risky for an individual.

SYNOD, a meeting or assembly. The name is generally reserved for assemblies of ecclesiastics who have met to discuss Church business.

SYNTHESIS, a putting together. It is the opposite of *analysis*, which signifies a taking apart, splitting up into its constituent parts. In chemistry, synthesis is making rapid strides, and substances are made now synthetically to such an extent as to do away with the necessity in some cases of producing them by natural means. The production of indigo is a striking illustration of this fact.

SYRIA, a part of the Turkish Empire in Asia, generally understood to extend from Mount Taurus on the north to the Arabian Desert in the south, and from the Levant on the west to the Euphrates and the Syrian desert on the east. This region, some 150,000 square miles in area, includes Palestine and Phœnicia, and some of the most ancient cities of the world. Damascus, the chief city (population 150,000), is mentioned in the time of Abraham, and though situated near the border of the desert, lies amid gardens and orchards, and still remains the centre of a great caravan trade with Persia and the East.

Aleppo, Beyrut, and Jerusalem, all ancient cities, also continue to flourish. Tyre and Sidon, however, have sunk into obscurity. The inhabitants, some 3½ millions in number, are mostly Mohammedans, but there is in Palestine an increasing number of Jews, and on and around Mount Lebanon, a sect of Christians called Maronites.

TABARD, (1) a tunic without sleeves which was an article of dress in England during the Plantagenet period, and which still forms part of the dress of a herald. (2) The name of an inn formerly situated in High Street, Southwark, rendered immortal by Chaucer, who makes his Canterbury Pilgrims start from it.

TABERNACLE, the tent in which the ark of the covenant, the table of shewbread, etc., were kept during the wanderings of the Israelites in the desert. It was 45 feet long, 15 feet wide, and 15 feet high, and was constructed of shittim wood. In the Roman Catholic Church, the name is applied to the vessel in which the consecrated elements of the Eucharist are kept.

TABITHA. See *Dorcas.*

TABLEAUX VIVANTS, that is, "living pictures," are representations by living persons of groups of statuary, famous pictures, scenes in history, etc.

TABLE BAY is situated in Cape Colony on the west coast of Africa. The capital of the Colony, Cape Town, stands upon its shores, and the bay is capable of holding the largest fleet. The anchorage has been improved by the construction of special harbour works.

TABLE MOUNTAIN, situated a short distance to the south of Cape Town, above the shore of Table Bay, is about 3,600 feet high, and derives its name from the fact that it possesses a very flat top and precipitous sides. A cap of mist, which often hangs on the summit, is called the "table-cloth."

TABLE TALK, the name sometimes given to collections of essays, dealing with subjects of general interest. Among the English writers, who have produced essays under this title, are Rogers, Cowper, and Coleridge.

TABLE TURNING, table tilting, or table lifting, are names given to the moving of tables at spiritualistic séances. A number of believers place their hands in a circle upon the table, and being unconscious of exerting any force in a particular direction, they claim that the movement produced is due to spirit agency. However produced, the movement has never been accounted for to the entire satisfaction of sceptics.

TABOO, a word in use among the inhabitants of the South Sea Islands, when speaking of anything which is either sacred or accursed, and must not be touched. The word is used as the name, both of the thing consecrated and the act of consecration. Thus the body of a chief is taboo; in other words, the tribesmen are forbidden to touch it under any circumstances.

TABOR, a mountain of Galilee, situated in the Plain of Esdraelon, about 6 miles east of Nazareth. It is clothed from base to summit with trees, and, according to tradition, was the scene of the Transfiguration of Christ.

TACITUS, CORNELIUS, *b.* about 54, *d.* about 120 A.D., one of the most celebrated of Latin historians. His works include "Annals," dealing with the period 14-68 A.D., "Histories," 69-97 A.D., "Germania," and "Agricola," the last named works dealing with the career of Julius Agricola, father-in-law of Tacitus.

TACTICS, that branch of military science which deals with the movements of troops, when they are face to face or actually engaged in battle. It must be distinguished from strategy, which deals with the general conduct of a campaign and from the operations which precede the actual fighting, such as manœuvring for position, etc.

TADMOR. See *Palmyra.*

TAGUS, the longest and most important river of the Peninsula, rises on the central plateau and enters the Atlantic Ocean at Lisbon, after a course of about 560 miles. There is a magnificent harbour at its mouth, but otherwise the river is of little commercial importance. The principal towns on its banks are Toledo and Madrid, the latter being situated on a small tributary.

TAHITI, the largest island of the Society group, situated in the South Pacific Ocean. It has an area of about 600 square miles, and produces copra, molasses, rum, and fruits. The island is under the protection of the French; population 11,000.

TAILOR BIRD, THE, a bird found in Southern Asia and the Malay Archipelago, derives its name from the fact that it constructs its nest by fastening together, with pieces of vegetable fibre, wool, etc., two or more hanging leaves. The nest is usually placed at the extremity of a slender branch, and is thus protected from attack.

TAINE, HIPPOLYTE ADOLPHE, *b.* 1828, *d.* 1893, a celebrated French philosopher and historian. One of his greatest works is a history of English Literature, in four volumes, and amongst his other works, which are very numerous, may be mentioned Studies of Carlyle and John Stuart Mill, and his masterpiece, "Origines de la France Contemporaine."

TAIPING REBELLION, the name given to an insurrection of a section of the Chinese which originated in 1850 and was not suppressed until 1864. The rebels were under the leadership of a man who declared that he was divinely appointed to establish a universal peace, though his real object was to overthrow the Manchurian dynasty. The rebels were finally defeated, largely through the assistance of British troops led by "Chinese Gordon."

TAIT, ARCHIBALD CAMPBELL, *b.* at Edinburgh, 1811, *d.* 1882, a celebrated English prelate. He was educated at Glasgow and Oxford. He succeeded Dr. Arnold as head-master of Rugby in 1842. He became Dean of Carlisle in 1850, Bishop of London in 1856, and Archbishop of Canterbury in 1868. He was a wise statesman as well as a liberal and earnest Churchman. He started "The Bishop of London's Fund" for the purpose of building and helping to support new Churches in the Metropolis. His writings include some sermons and theological works of a critical nature.

TAJ MAHAL, a famous and beautiful mausoleum erected at Agra, India, by Shah Jehan for his favourite wife. It is of great size and is built of white marble, beautifully inlaid with precious stones. The work of building was spread over twenty years, and over 20,000 men were continuously employed upon it during that time.

TAKU FORTS are situated at the mouth of Pei-ho River, and guard the approach from the sea to both Tienstin and Pekin. They were taken by the combined forces of Great Britain and France in 1858 and 1860, and again by the European forces engaged in suppressing the Boxer rebellion, 1900.

TALAVERA, a small town of Spain, is situated on the Tagus, about forty miles east of Toledo. Talavera was the scene of a battle during the Peninsular War, in which the British, led by Sir A. Wellesley, defeated the French under King Joseph. For his success, Wellesley was created Viscount Wellington.

TALBOT, WILLIAM FOX, *b.* 1800, *d.* 1877, was one of the pioneers of the science of photography. The actual discovery of the process was made both by Talbot and Daguerre. He was also one of the first to decipher cuneiform inscriptions.

TALC, one of the softest of all minerals, is chemically, a hydrated silicate of magnesium. Its colour varies from white to a greenish white, and it possesses the property of being easily split into thin semi-transparent plates. It is used in the manufacture of crayons and porcelain, and also for forming crucibles and lamp shades and chimneys.

TALENT, a weight or sum of money which was in use amongst the ancient Greeks and Hebrews. Amongst the Greeks three distinct talents were in use, the weight of the least being about fifty-seven pounds troy, and of the greatest about eighty-two.

TALISMAN, a charm, consisting usually of a figure engraved upon stone or cast in metal. The use of charms is closely connected with the science of astrology, and it was generally believed in the Middle Ages that the talisman protected its wearer from evil spirits. The belief that such objects may bring good fortune to their possessors is not entirely dead at the present day, though the term "mascot" is now more generally applied to them.

TALLAGE, an arbitrary tax levied by the Anglo-Norman Kings on cities, boroughs, and the royal demesnes. It took the place of the ancient Dane-geld, and continued to be levied until early in the 14th century. It was abolished (1340) by the statute "de Tallagio."

TALLEYRAND, PERIGORD DE, *b.* at Paris, 1754, *d.* 1838, a celebrated French politician and a clever diplomatist. He was educated for the Church, and became Bishop of Autun, 1789, but even at this time devoted nearly all his attention to politics. For some time he supported the Republican party, but withdrew his support on their policy becoming subversive of all authority but their own. He was compelled to leave France, 1793, but returned three years later and became a firm supporter of Napoleon, until the Emperor's waning success induced Talleyrand to enter into a secret correspondence with Louis XVIII., whom he eventually saw seated upon the throne of France. In 1830, on the outbreak of the second revolution, Talleyrand again appeared on the side of a successful party, supporting Louis Philippe. His skill as a diplomatist was unrivalled, but he seems to have owed his success, in no small measure, to his want of moral principle.

TALLIS, THOMAS, *b.* about 1515, *d.* 1585; the father of English cathedral music, was organist of Waltham Abbey, till 1540, and afterwards a member of the Chapel Royal choir. His compositions are remarkable for solemnity and majesty, and his "Venite" and other canticles are still sung.

TALLY, a stick which was formerly used in keeping accounts. The stick was split longitudinally into two pieces, one of which was kept by the creditor, the other by the debtor. The transactions were recorded by cutting notches in the two pieces, these being placed side by side for the purpose, and the accuracy of the account was ensured from the fact that the notches must coincide. Tallies were preserved by the Exchequer until 1834, and it was owing to the overheating of a stove in which the old sticks were being destroyed, that the Houses of Parliament were burnt down in that year.

TALLY SYSTEM, a method of selling goods upon credit, in which both the buyer and seller hold books in which the pay-

ments are recorded. The payments are usually made weekly, and the goods most frequently obtained in this way are clothing and finery. The system is worked by pedlars who call from door to door, especially in country towns and villages.

TALMUD, the work which contains the traditional laws of the Hebrews. It is divided into "Mishnah," and "Gemara"; the former contains the laws, etc., which govern almost every action of the Hebrew, and the Gemara contains the exposition and discussions upon these laws. The Gemara is merely a record of the oral teaching as carried on in the synagogue. According to its actual contents, the Talmud is also divided into Halacha and Hagada. The former consists of detailed instructions as to conduct, and the latter of the comments on parts of the Holy Scriptures. There are two distinct Talmuds in existence, known respectively as the Jerusalem and the Babylonian, the former being the earlier and shorter of the two.

TAMARIND, a plant having two varieties, one found in the West Indies and the other in the East Indies. The wood of this tree is used in building, its bark serves as a tonic, and from its leaves a dye is extracted. The fruit is largely used in the making of sauces.

TAMERLANE. Same as *Timur.*

TAMIL, a name often used to denote the people of South India generally, but strictly belonging only to those occupying the south-eastern part of the Peninsula and northern Ceylon. They are very frugal and enterprising, and their language and literature form an interesting study.

TAMMANY SOCIETY, a powerful political organisation which has its headquarters at New York. It was founded in 1789 as a secret social society, the aims at first being of a charitable nature; but quite early in its history it became political in its aims, and associated itself with what is now known as the Democratic party. It has at times been all powerful in the politics of New York City, where its members have acquired an unenviable notoriety for peculation. In 1901 it received a severe shock when the whole of the "reform" candidates, who had advocated honesty in political matters, were elected in the New York local elections.

TANANARIVO, or **ANTANANARIVO,** the capital of Madagascar, is situated on a plateau about 4,500 feet high, some considerable distance from the sea. Its church spires, palaces, and red, pointed gables in the European style are conspicuous for miles around. Since 1895 it has been occupied by the French; population about 100,000.

TANCRED, *b.* 1078, *d.* 1112, a celebrated Sicilian prince of Norman descent, and one of the prominent leaders of the first Crusade. He was present at the taking of Jerusalem, 1099, and also at Ascalon, the same year, when Godfrey, the newly-elected King of Jerusalem, defeated the Sultan of Egypt. Tancred and his leader, Godfrey, are depicted in Tasso's "Jerusalem Delivered" as model knights.

TANGANYI'KA, a long, narrow lake, which is situated in the eastern part of Central Africa, at an altitude of about 2,700 feet. Its length is about 400 miles and its area 13,500 square miles. The lake was discovered, 1858, by Burton and Speke, and has been explored by Livingstone, Stanley, Cameron, and others. The surplus waters of the lake find their way into an affluent of the Congo.

TANGIER, the principal sea-port of Morocco, is situated on the Straits of Gibraltar. Its position is one of considerable strategic importance, almost rivalling in that respect Gibraltar itself. Tangier was occupied by the English during the 17th century, but abandoned on the score of expense; population about 25,000, of whom nearly 6,000 are Europeans.

TANN'HÄUSER, a celebrated legendary German hero. According to the legend, Tannhäuser, after living for some time in Venusberg amidst voluptuous pleasures, was induced by the Virgin Mary to lead a holy life. He travelled to Rome to obtain absolution, but Pope Urban declared himself unable to grant this, adding that he would not do it until the rod in his hand should sprout. Shortly after the departure of Tannhäuser, the rod actually began to sprout, but all efforts to find the hero failed. The legendary Tannhäuser has been confused with a wandering minstrel of the same name who actually existed during the 13th century. The story forms the subject of a well-known opera by Wagner.

TANNIN, a chemical substance which is obtained from gall-nuts, and the bark and leaves of many trees, among which may be mentioned the oak, larch, hemlock, spruce, and birch. Tannin is used to convert skins and hides into leather.

TANNING, the name given to the process of converting skins and hides into leather. By tanning, the skin is prevented from putrefying, and is kept soft and pliable. The skins used are usually those of cattle, goats, horses, and pigs. The process is as follows:—The skin is washed and scraped, and the outer surface and hairs removed by soaking in lime water. The actual tanning may be performed in two ways. In the case of the heavier skins, or hides, as they are called, alternate layers of bark and hides are placed in tan pits dug in the ground. The lighter skins are placed in a liquid obtained by steeping the bark in water. The process in either case is somewhat lengthy, usually being spread over from three to four months. In the case of leathers intended for gloves and the upper parts of "kid" boots, alum water is sometimes used instead of the ordinary tanning mixture. This process is known as "tawing," and is much more rapid than tanning.

TANTALLON CASTLE, in Haddingtonshire, 3 miles east of North Berwick, is a fine ruin, once the stronghold of the haughty Douglases. It is well described in Scott's Marmion, and for dramatic effect the parting of Marmion and Douglas at its gates is hardly surpassed.

TAN'TALUS, in classical mythology, a son of Zeus, who became king of Lydia. For some offence, such as that of betraying the secrets of the gods, he was condemned to a terrible punishment in the lower world. Afflicted with a raging thirst and hunger, he was placed in a pool of water which reached his chin, but which ever receded as he stooped to drink. Above his head hung luscious fruits, which, like the water, receded as he stretched out his hand to seize them.

TAPESTRY, the name given to wall hangings which were in general use among the rich before the introduction of wall paper. Tapestry was either made of silk or wool, and in it were woven designs representing historical scenes, animals, &c. The Bayeux tapestry is an historical record of the Norman conquest, and may still be seen at Bayeux (Normandy). Some of the most famous tapestry of the Middle Ages was produced at Arras (Flanders). Modern tapestry is often of great beauty and much resembles expensive carpeting.

TAPIOCA, a meal which is used as a foodstuff, and which is obtained from the tuber of a plant, grown in Brazil and other tropical countries. The tubers, when eaten raw, are poisonous, but the harmful constituents are driven off by reducing the tuber to a meal and roasting it. Pearl tapioca is obtained from starch grains. (See *Manioc.*)

TAR, a viscid black liquid, which is obtained by distilling coal or wood in closed vessels. It is one of the chief by-products in the manufacture of coal gas. Naphtha, benzol, pitch, etc., are obtained from tar, and from benzol and substances resembling it, the valuable aniline dyes are obtained.

TARA, HILL OF, an eminence in County Meath, Ireland, 7 miles south of Navan. Here the kings of Ireland are said to have been crowned; here St. Patrick preached, and the Danes were defeated; and here O'Connell held his last great "monster meeting" on the Repeal of the Union.

TARAN'TULA, a species of spider which is found in Italy, United States, etc. It is usually about an inch in length, and its bite is painful and venomous. The bite was formerly supposed to cause a kind of dancing madness, somewhat resembling St. Vitus' Dance, to which the name "Tarantism" was given.

TARE AND TRET. See *Commercial Dictionary.*

TARGET, a mark set up in shooting contests. In rifle practice an iron target is used, which is divided, by concentric circles, into parts known as bull's eye, inner, magpie, and outer, and the number of points scored depends upon the part struck. The targets used in big-gun practice are usually light structures of lath and canvas, or a barrel whose position is indicated by a flag. The word "target" was formerly the name of a shield.

TARGUM, the name given to various incomplete versions of the Old Testament, which are written in the Chaldæan language. They contain explanations of the text in addition to the text itself, and are reproductions of the oral teaching as given in the synagogue. They were compiled either during the Babylonian captivity or on the return of the Jews to Palestine, at the time when many of the Jews had forgotten their own language.

TARPEIAN ROCK, a precipitous rock which is situated on the Capitoline Hill, Rome. It obtained its name from a Roman maiden, Tarpeia, who treacherously admitted the Sabines into Rome. As they entered they threw upon her their shields and thus crushed her to death. She was buried near the rock named after her. The rock afterwards became the place of execution of traitors and criminals, who were thrown over its edge.

TARRAGONA, a sea-port of Spain, which is situated upon the Mediterranean coast. It is the capital of a province of the same name, and exports wine, oil, and fruits; population over 20,000.

TARTAN, a kind of cloth, mostly of wool, the pattern consisting of lines running at right angles, composed of bright colours ingeniously graded, the prevailing colour being generally green or red. A plaid and kilt of tartan was long the recognised dress of a Highlander, each tribe having its own tartan. After the Jacobite rising of 1745, the tartan was interdicted for some years.

TAR'TARUS, in Greek mythology a deep abyss situated below Hades, from which it was separated by huge gates. It is sometimes regarded by the ancient writers as the place of punishment, and sometimes was confused with Hades (the abode of the dead).

TARTARY, or **TATARY,** the name of a district of Central Asia. The word is used in a very vague sense, and is now applied to parts of the Chinese Empire, Turkestan, and Southern Russia. The

Tatars were a branch of the Mongolian race, who probably occupied a part of Manchuria about the 10th century, and the name was given by Europeans to the followers of Genghis Khan, who took Pekin and overran Central Asia during the 13th century. The name was afterwards applied to the members of all the Mongol hordes which appeared in Western Asia and Eastern Europe. The incorrect spelling "Tartar" is probably due to confusing "Tatar" with "Tartarus."

TASMAN, *b.* 1602, *d.* 1659, a celebrated Dutch explorer, who discovered Tasmania, 1642, and New Zealand. He also explored a portion of the north coast of Australia.

TASMAN SEA, the sea between New Zealand on the east, and Australia and Tasmania on the west.

TASMANIA, an island situated to the south of the Australian colony of Victoria, from which it is separated by Bass Strait. Tasmania is one of the States which form the Australian Commonwealth. Grazing and fruit-growing are the chief industries; wool and fruits the chief exports. Tasmania was discovered in 1642 by Tasman, by whom it was named Van Diemen's Land, after the governor of Batavia. In the early days of the 19th century it formed part of the colony of New South Wales, and until 1853 was used as a penal settlement. The original inhabitants, who closely resembled the Australian aborigines, became extinct, 1876. Refer to "Tasmania" in *Index*.

TASSO, TORQUATO, *b.* 1544, *d.* 1595, one of the greatest of the Italian poets. His greatest work, "Jerusalem Delivered," deals with the first crusade, and is one of the finest epics ever written. Shortly after its completion, 1574, Tasso became subject to delusions, and at length was confined in a convent at Ferrara for medical treatment. He never fully recovered his health and spirits.

TATE AND BRADY. Nahum Tate was born in Dublin (1652) and educated at Trinity College. Coming to London he gained Dryden's patronage, and was made poet-laureate after Shadwell. He was assisted by Nicholas Brady, also of Irish birth, in the production of a metrical version of the Psalms, selections from which were sung in all parish churches until the introduction of hymns, in the latter half of the 19th century. The diction is smooth, and a few pieces as "While Shepherds watched," and "As pants the Hart," are still popular.

TATIAN, *b.* in Syria about 120 A.D., a celebrated theological writer. He became a Christian about 150 A.D., and wrote "An Apology for Christianity," and "A Harmony of the Gospels," called the *Diatessaron*, a work from which we learn that about 160 A.D., our four gospels had already taken a place of supreme importance in the Church.

TATTERSALL'S, a well-known horse-market, which is situated at Knightsbridge Green, London. It was established, 1770, by Richard Tattersall, and its business is largely in connection with the sale of thoroughbreds. The name is also applied to one of the enclosures situated upon racecourses.

TATTOOING, the operation of pricking the human skin and staining the punctures with some colouring matter. The practice is common among the inhabitants of the South Sea Islands and Japan, and amongst the various Indian tribes of America. The marks made are permanent, and, when skilfully performed, the operation is not very painful. Tattooing seems to have been known and practised by the Israelites in early times, since the practice is forbidden in Leviticus xix. 28.

TAUCHNITZ, (1) Karl, *b.* 1761, *d.* 1836, a famous German printer who introduced the stereotyping process into his native country. (2) Christian, *b.* 1816, *d.* 1895, the nephew of the above, published at Leipzig numerous cheap translations of German and ancient Classics, and editions of English works, which, however, he publishes without loss to the living writer.

TAXIDERMY, the art of preserving the skins of animals, birds, etc., and also of stuffing and mounting these skins, in such a way that they closely resemble the living animals.

TAY BRIDGE, a railway bridge, over 10,000 feet in length, across the Tay, at Dundee. The present bridge was opened for public traffic in 1887. It takes the place of the first bridge, which in 1879 was partly destroyed by a gale that left a gap of about 3000 feet, into which plunged a railway-train that was passing at the time. About eighty persons perished.

TAY, RIVER, the longest river of Scotland, rises in the Western Highlands, expands into Loch Tay, and after a course of about 100 miles, enters the North Sea by the Firth of Tay. Like most of the Scottish rivers it is a famous stream for salmon. The principal towns upon the river are Perth and Dundee (the latter on the estuary).

TAYLOR, JEREMY, *b.* at Cambridge, 1613, *d.* 1667, a famous divine and writer on theology. During the civil war, Taylor acted as chaplain to Charles I., and at the Restoration was appointed Bishop of Down, and some years later Vice-Chancellor of the University of Dublin. His best known works are entitled "Holy Living," and "Holy Dying."

TAYLOR, TOM, *b.* at Bishop-Wearmouth, 1817, *d.* 1880; dramatist and man of letters, had a most successful career at Glasgow and Cambridge Universities. He was afterwards Professor of Literature at University College, London. But he got more and more engrossed in literary and dramatic work, being first on the staff of "Punch," and afterwards its editor; and in addition, producing numerous plays, almost all successful, as "Our American Cousin" (Lord Dundreary), "Masks and Faces," "Still Waters run Deep," etc.

TAYLOR, ROWLAND, was one of the prominent martyrs during the reign of Queen Mary I. He acted for some time as chaplain to Archbishop Cranmer, and at the time of his death, 1555, was Vicar of Hadleigh.

TEA, the prepared leaves of a shrub or tree which is grown in China, Assam, Ceylon, and Java. In China, the leaves are obtained from a shrub which attains a height of about 5 feet, whilst in Assam, a province of India, they are those of a tree, which is about 20 feet high. After the leaves have been picked they are heated in shallow pans and then rolled by hand. If the leaves are allowed to ferment before heating they give what is known as black tea, if not, green tea is obtained. Tea seems to have been used in China from the earliest times. It was introduced into Europe during the 16th century, but its price was for a long time prohibitive to all but the very rich. The bulk of the tea consumed in Europe was obtained from China until about 1840. Then Assam appeared as a competitor, and some 30 years later, its cultivation was introduced into Ceylon with marked success. India and Ceylon tea now forms nine-tenths of that imported into the United Kingdom.

TEAK, the name of a tree which is grown throughout the East Indies, especially in Burma, Assam, and the Philippine Islands. The largest trees are about 8 feet in diameter. The timber, which is hard and durable, is used in ship-building, carriage making, etc.

TEASEL, a plant which is found in the temperate districts of the northern hemisphere. The "burr" or prickly head of the plant is used in the manufacture of woollen goods, to "tease" the cloth and thus produce a nap. Various attempts have been made to construct suitable steel teasels, but without success, owing to the steel tearing the cloth. Teasels are imported in large quantities into Yorkshire.

TECK, a small German duchy, which is situated near Wurtemberg. In 1866 the Duke of Teck married Princess Mary of Cambridge, whose daughter married the heir to the British Crown.

TE DEUM, a hymn of praise, which obtains its name from the fact that its opening words are *Te Deum laudamus*, "We praise Thee, O God." It dates from the 4th or 5th century, and forms a part of public worship in the English, Roman Catholic, and other Christian Churches.

TEETOTALISM. This particular form of guarding against the abuse of alcoholic liquors had its origin in Preston, Lancashire, in 1832, when the "seven men of Preston" led by Joseph Livesey, resolved on total abstention in lieu of moderation. The name arose from a declaration by Richard Turner, in 1833, in favour of "tee-total abstinence,"—the "t" being reduplicated, it is said, because he used to stammer in pronouncing "total."

TEHERAN, the capital of Persia, is situated about 70 miles due south of the Caspian Sea. It is a mean-looking town, but its bazaars are crammed with silks, shawls, satins, and carpets; population 250,000.

TEINDS, The Scottish name for tithes. The origin and history of "teinds" in Scotland is much the same as that of "tithes" in England (See *Tithes*).

TELEGRAPHY. See *Electric Telegraph* and *Wireless Telegraphy*.

TEL-EL-KEBIR, situated about 50 miles north-east of Cairo, was the scene of a battle in which Sir Garnet Wolseley defeated Arabi Pasha, 1882. The latter had organised a rebellion against the Khedive, the object of which was to put an end to foreign interference in Egyptian affairs. Since the battle, a British force has been maintained in Egypt.

TELE'MACHUS, (1) the son of Ulysses and Penelope, who assisted his father on his return home after his wanderings in slaying the suitors of his mother. (2) A monk, who during a gladiatorial combat at Rome, 404, rushed into the arena to separate the combatants, and was stoned by the people for doing so. His death shocked the Christian part of the community, and led to the suppression of the combats.

TELEOLOGY, that branch of Metaphysics, or Mental Philosophy, which deals with "final causes," or the end which each thing in Nature is designed to subserve, and draws hence an argument for the existence of a Creator. Xenophon, in his "Memorabilia," represents Socrates as using the "argument from final causes" with considerable effect.

TELEP'ATHY, name given to a supposed communication of sensations between two persons, who may be a considerable distance apart at the time, but between whom there exists a close sympathy.

TELEPHONE, an instrument for conveying sounds to a distance by means of electric currents. In 1861, Reis succeeded in transmitting musical tones and other sounds to a distance of several miles, but Graham Bell, in 1876, was the first to send articulate speech. His instrument consists of a transmitter and receiver of similar structure connected by a wire. Speaking into the transmitter causes a

thin metal plate to vibrate. These vibrations are transmitted by means of an electric current to the corresponding plate in the receiver, which vibrates in an identical manner, and thus re-produces the sounds uttered by the speaker. For practical purposes, a modified form of microphone is used as a transmitter, and a Bell telephone as the receiver. Messages have been successfully sent to a distance of 1,500 miles.

TELESCOPE, an instrument employed for the purpose of viewing distant objects. There are two classes of the instrument, the refracting and the reflecting. The common astronomical refracting telescope consists essentially of an objective and an eye-piece or ocular fitted into a tube, with some mechanical contrivance for adjusting the distance between the two. The objective is a double convex lens. The rays of light, proceeding from the distant object to which the telescope is directed, are brought to a focus somewhere within the tube, and an inverted image of the object is formed at that spot. This inverted image is magnified by the convex lens of the ocular. To produce a bright and distinct image a large objective is necessary, and in the telescopes employed in observatories this is often from 16 to 24 inches in diameter, and the tube from 20 to 30 feet in length. The inversion of the image is no drawback when a celestial body is being observed. In terrestrial telescopes this is corrected by modifications in the ocular; either two additional convex lenses of equal curvature are introduced, or, as in the Galilean instrument, the ocular consists of a double concave lens. Opera-glasses and field-glasses consist usually of a pair of Galilean telescopes. The reflecting telescope is a much more powerful instrument. In this the objective is replaced by a concave mirror usually of speculum metal. The reflector forms an inverted image of the object under examination, and this is viewed through a magnifying ocular, placed in the side of the tube in Newton's and Herschel's telescopes, or in the end in the Gregorian. In the latter instrument the image is viewed through a central aperture in the main reflector, and a second smaller reflector is introduced facing the former, by means of which the inversion is corrected, the second image formed by it being magnified by the lens of the ocular. In the largest reflecting telescopes the reflector has a diameter of from 6 to 7 feet.

TELFORD, THOMAS, *b.* 1757, *d.* 1831, one of the greatest civil engineers of the early part of the 19th century. Among the numerous works carried out by him, were the construction of the Caledonian and Grand Trunk Canals, of the Menai Suspension and Conway Bridges, and of St. Catherine's Docks. He also superintended the work of draining a large area of the Fen district.

TELL, WILLIAM, the national hero of the Swiss, whose renown rests upon his patriotic endeavours to secure the independence of Switzerland. According to the legend he was compelled to shoot an apple from his son's head, as a punishment for some offence committed against an Austrian officer named Gessler. This he accomplished successfully, but afterwards accidentally disclosed a second arrow, which he said was to have been used to kill Gessler, had any harm come to his child. He afterwards killed Gessler, 1307, and helped his countrymen to throw off the Austrian yoke. A monument to Tell has been erected at Altorf to mark the spot where he shot the arrow.

TEMPE, VALE OF, a lovely valley in the north-east of Thessaly, Greece, where the river Peneus (now Salamvria) forces its way to the sea between Mt. Olympus on the north and Mt. Ossa on the south. The poets made Tempe a favourite haunt of Apollo. It had great strategic value, as being the only pass into Thessaly from the north.

TEMPERAMENT. The word "temperament" originally signified "a mixture in due proportions," "a condition resulting from mixture." Hence the ancients made man possess a choleric, phlegmatic, melancholy, or sanguine temperament, according as one or other of the four "humours" was supposed to predominate in his constitution. In music the term is applied to a compromise by which a note halfway between, say C and D, is made to do duty for both C sharp and D flat, although according to strict harmonics, it is neither.

TEMPLARS, KNIGHTS, a religious order of knights, which was founded 1118 A.D. The object of its members was to protect pilgrims to Jerusalem, and the headquarters of the order were at that city until it fell into the hands of the Saracens, 1186, when they were removed to Cyprus. The Knights wore a mantle bearing a red Maltese cross on the left shoulder. A number of the monks settled in London in the district still known as The Temple, and where their church still stands. The order was suppressed about the end of the 13th century.

TEMPLE BAR, an arched gateway which formerly stood in Fleet Street, and separated the City from Westminster. It was removed in 1879, owing to the fact that it obstructed the traffic, and now stands erected at Theobald's Park, Cheshunt.

TEMPLE, FREDERICK, Archbishop of Canterbury, *b.* 1821, *d.* 1902; was educated at Tiverton School and at Oxford, where he became fellow and tutor of Balliol. In 1858 he became head-master of Rugby, and in 1860 appeared "Essays and Reviews," containing an essay by him, entitled, the "Education of the World." Great opposition, accordingly, was manifested to his appointment to the see of Exeter, 1869, but the sincerity, wisdom, zeal, and high Christian character shown in the strenuous discharge of his Episcopal duties soon silenced all objectors, and he lived to be promoted with almost universal approbation to the see of London, 1885 and of Canterbury, 1896. He had the honour of taking the leading part at Queen Victoria's Thanksgiving Service at St. Paul's, 1897, and at the Coronation of King Edward, 1902.

TEMPLE, HENRY JOHN. See *Palmerston, Viscount.*

TEMPLE, THE, was situated on Mount Moriah, in Jerusalem. It was built by Solomon, and was 60 cubits long, 20 wide, and 30 high, and was divided into two chambers, the innermost being known as the "Holy of Holies," in which was placed the ark of the covenant. This temple was destroyed by Nebuchadnezzar, but rebuilt by the Jews on their return from Babylon. The temple was again rebuilt by Herod the Great, and was finally destroyed by the Romans, 70 A.D.

TENCHEBRAI, a small town of Normandy, the scene of a battle in which Henry I. of England defeated his elder brother, Robert, Duke of Normandy, 1106. As a result of the victory, Normandy remained for 100 years under the rule of the King of England.

TENEBRÆ (L. *darkness*), the name given in the Roman Catholic Church to a special service on Good Friday and the two preceding days. Its peculiarity lies in the fact that during the service all the lights in the church are gradually extinguished till only one remains, and this (as a symbol of our Lord's death and burial) is hidden for a time near the altar.

TENERIFFE, the largest of the Canary Islands, has an area of over 700 square miles. It contains the famous volcanic Peak of Teneriffe, which rises to a height of 12,000 feet. The exports include wine and tobacco; population about 200,000.

TENIERS, DAVID (the younger), *b.* at Antwerp, 1610, *d.* 1690, inherited from his father, of the same name, the artistic talent he developed to such a high degree. He painted about 700 pictures, chiefly scenes of peasant life, a dozen of which are in the National Gallery, London. He took a great share in founding the Antwerp Academy.

TENNIEL, JOHN, *b.* in London, 1820, a famous artist, who made his reputation as a cartoonist in the pages of "Punch," his work for many years including the production of the political cartoon. He joined the staff of the paper in 1851, and retired in 1901.

TENNYSON, ALFRED, *b.* at Somersby, Lincolnshire, 1809, *d.* 1892, was one of the greatest of the English poets of the 19th century. His life was devoid of incident, and throughout his career he was noted for his hatred of public attention. Tennyson became poet laureate in 1850, and was raised to the peerage in 1884. Among his principal works may be included "In Memoriam," "The Idylls of the King," and "The Princess."

TENTERDEN, a small market town of Kent, 13 miles south-west from Ashford. It is chiefly interesting for its church with fine perpendicular tower, the traditional cause of Goodwin Sands. The abbot of St. Augustine's, Canterbury, is said to have used the stone that should have repaired the sea-wall of Earl Godwin's estates to build the tower, and so during the next violent storm the said lands were inundated, and Goodwin Sands formed.

TERAPHIM, the name given, among the ancient Hebrews, to certain household deities corresponding to the Penates of the Romans. The idols which Rachel stole from Laban were probably of this kind.

TERENCE, *b.* at Carthage, 195, *d.* 159 B.C., the greatest of the Latin comic poets. He was brought as a slave to Rome, and subsequently given his freedom. Six of his comedies are extant, the best known being "Phormio" and "Adelphi."

TERMITES, or white ants, are found in most tropical countries. They live in large colonies and build nests of clay which are often as much as 10 feet in height. The whole of the members of one colony are descended from one king and queen, and the various members are divided into workers and soldiers, which are blind and wingless, and a third variety possessing eyes and wings. Termites are vegetarians and are very destructive in forest districts.

TERPSICH'ORE (o-re) "delighting in the dance"; one of the nine Muses, inventress of dancing and, according to some, of the cithara. She is represented as a virgin crowned with laurel, and holding a musical instrument.

TERRA-COTTA ("cooked, i.e., baked, earth or clay"), the Italian name for pottery or earthenware, applied generally to articles not for domestic use, as ornamental bricks, tiles, vases and statues or statuettes. The use of terra-cotta is very ancient, many examples being found in the ruins of old cities in Greece and Asia Minor. Its use was revived in England by Wedgwood and has been greatly extended by Doulton and other makers for architectural purposes. (See *Tinworth, George*).

TERROR, REIGN OF, the name given to that period of the French Revolution which was marked by the execution of

thousands of the French nobility and other prominent persons. It lasted about fourteen months during the years 1793–4, and was ended by the fall of Robespierre.

TERRY, ELLEN (Mrs. E. A. Wardell). *b.* 1848, the greatest English actress of the last few decades, made her first appearance on the stage when eight years old, and acted regularly from fifteen. She belongs to a family of actors, her father, brother, and two sisters being distinguished members of the theatrical profession. She became a member of Irving's company in 1878, when he took the Lyceum, and shared with him the successes which made that name a household word. She shared, too, in his American triumphs, visiting the States with him in 1883 and various years subsequently.

TERTULLIAN, *b.* about 150 A.D., *d.* 230, a celebrated theological writer. He was the son of a Roman centurion, and after his conversion wrote a "Defence of Christianity." He was remarkable for his impassioned eloquence.

TESLA, NIKOLA, *b.* in Servia, 1857, a celebrated electrician and physicist. Since 1884 he has been living in the United States, where for some time he worked with Edison.

TEST ACT, an Act of Parliament, passed 1673, which required all persons holding public offices to take the oath of allegiance, to denounce the doctrine of transubstantiation, and to receive the sacrament of the Lord's Supper, according to the rites of the Church of England, at least once a year. This was done to prevent both Roman Catholics and Nonconformists from holding these offices. The act was made inoperative by an act of indemnity which was passed annually, but it was not repealed until 1828.

TÊTE NOIR, a well known Alpine pass, leads from the Rhone valley at Martigny to Chamonix at the foot of Mont Blanc; height about 5,000 feet.

TETZEL, JOHANN, *b.* at Leipzig, 1455, *d.* 1519, a Dominican monk, who carried on a profitable business of selling indulgencies, the money which he obtained being used to defray the cost of building St. Peter's at Rome. It was the action of Tetzel which caused Luther to publish his protest, 1517, which practically marks the beginning of the Reformation on the Continent.

TEUTONIC KNIGHTS, an order similar to the Templars and the knights of St. John, but restricted to Germans. Founded at Acre in 1190, it soon became a powerful organization, and when the object of the Crusades became hopeless, it devoted its attention to the Church's enemies nearer home. From Marienbad, its headquarters, to the Gulf of Finland its rule extended, and a long contest with the heathen Prussians and Lithuanians kept enthusiasm alive. But with the conversion of these, the order declined, and was suppressed by Napoleon in 1809.

TEUTONS, the name given to a number of closely related tribes, who inhabited parts of Central and Western Europe. They received a crushing defeat at the hands of Marius at Aquæ Sextiæ, 102 B.C., but some centuries later swarmed into Spain, Italy, and the Balkan Peninsula, and destroyed the Roman Empire. At the present time the name is often restricted to the inhabitants of Germany, though, strictly speaking, the British, Scandinavian, Danish, and Dutch nations are of the same stock.

TEWKESBURY, a small town situated in Gloucestershire, at the junction of the Avon and Severn. It was the scene of a battle fought during the Wars of the Roses, in which the Lancastrians under Margaret of Anjou were defeated by the Yorkist forces of Edward IV., 1471. It has a celebrated abbey church founded in the 12th century.

THACKERAY, WILLIAM MAKEPEACE, *b.* at Calcutta, 1811, *d.* 1863, a celebrated English novelist and humorist. He contributed numerous articles to "Punch," and became the Editor of "Cornhill," 1860. His novels are generally weak in plot, but are distinguished by their genial satire and keen insight into human nature. His principal works are "Vanity Fair," "Pendennis," "The Newcomes," "Esmond," "English Humorists of the 18th Century," and "The Four Georges."

THALES, (a-les) *b.* at Miletus, 640 B.C., one of the seven wise men of Greece, distinguished as a philosopher, astronomer, and mathematician. He taught the sphericity of the earth and explained the causes of eclipses, on account of which he was accused of impiety to the gods. Sentence of death was pronounced against the philosopher and all his family, a sentence afterwards commuted, through the influence of Pericles, to banishment.

THAMES, the chief river of England, rises in the Cotswold Hills, and flows into the North Sea after a course of over 200 miles. It possesses an estuary 50 miles in length, and the tide ascends as far as Teddington, 20 miles above London Bridge. The width of the Thames at the latter place is about 860 feet. During its course the river forms the boundary between nine counties, and it is connected by canals with all the important English rivers. Its commercial importance may be estimated from the size and wealth of London. The principal tributaries are the Kennet, Wey, and Mole on the right bank, and on the left the Thame and Lea. On its way to the sea it passes Oxford, Abingdon, Reading, Eton and Windsor, Kingston and Richmond; it flows through London, and on its estuary stand Greenwich, Woolwich, Gravesend, Sheerness and Southend. Below London-bridge the river is packed with merchant ships from all quarters of the world.

THANE, a class or rank in Anglo-Saxon times answering as nearly as possible to our "landed gentleman." Below the noble (earl), and above the working farmer (ceorl), he corresponded to the Norman knight. The title was hereditary, and could be acquired by any who possessed five hides of land or made three voyages in his own ship.

THANET, ISLE OF, a district forming the north-eastern corner of Kent about 10 miles long and 5 miles wide. In early times it was actually an island formed by the two mouths of the Stour, one flowing north to Reculver, the other south to Richborough. It formed the first settlement of the English in England, and here Augustine after landing at Ebbsfleet, awaited Ethelbert's permission to come to his court. The inhabitants, numbering over 60,000, are chiefly collected in the popular watering-places of Margate, Ramsgate, and Broadstairs. *Margate*, celebrated for its fine bracing air, is one of the resorts most favoured by Londoners, having about 100,000 visitors annually. *Ramsgate*, looking over Pegwell Bay to Sandwich, is also a popular seaside place, with a considerable coasting trade. *Broadstairs*, with its firm sands and sheltered position, is an ideal bathing-place.

THANKSGIVING DAY, a day specially set apart in the United States by proclamation of the President as a day of general thanksgiving for the harvest and other blessings of the year. It is usually the last Thursday of November, and one cannot read a novel dealing with American life and manners without being struck with the zest and earnestness that enter into its observance.

THEBES. (1) An ancient capital of Egypt, situated on both sides of the Nile, about 300 miles in a direct line from Cairo. Thebes was probably founded about 2500 B.C., and reached the height of its power during the years 1600–1100 B.C.; it decreased in importance as the delta region became more important, and finally the capital was transferred to Memphis. The site is now marked by the village of Luxor, in the neighbourhood of which are many magnificent ruins of temples, tombs, and obelisks. (2) The capital of Bœotia, one of the divisions of ancient Greece, is situated some distance north of Athens. It is said to have been founded about 1500 B.C., by the Phœnicians.

THEISM, the belief in the existence of a personal Deity, that is, the exact opposite of "Atheism." The term may thus be used to describe the beliefs held by Christians, Jews, and Mohammedans, and of all others who recognise the existence of one Supreme Deity.

THEMIS'TOCLES, (o-cles) *b.* about 515, *d.* 449 B.C., a famous Athenian commander and statesman. He was largely responsible for the crushing defeat of the Persian fleet at Salamis, and subsequently increased considerably the power of Athens. Having excited the jealousy of some of the citizens, he was ostracised and went to Persia to the court of Artaxerxes, where he died.

THEOCRACY, the name given to a system of government by ecclesiastical authorities, and hence regarded in primitive times as government by God Himself. The Israelites possessed such a government from the Exodus until the appointment of King Saul.

THEODOLITE, an instrument used in astronomical work and in land surveying, to measure angles in either a horizontal or vertical plane. It consists of a telescope, to which is attached a graduated circle, which rotates in a vertical plane. The telescope is supported upon a graduated circle, which rotates in a horizontal plane. The telescope can thus be turned towards any point, and the angles through which it turns read off from the circles. The instrument is provided with a compass and spirit levels, to assist in arranging it in position.

THEOLOGY, the science which treats of the nature of God, and the relations which exist between God and man. It is divided into two main divisions, Natural and Revealed Theology. The former is the result of observation and pure reasoning, the latter deals with Holy Scripture and revealed religion generally. Christian Theology deals with different aspects of revealed religion, e.g. *historical* theology treats of the history of religious thought; *dogmatic* theology deals with the system of religious doctrine; and *apologetic* theology investigates the truth of the religion from the standpoint of an adherent, defends it against the attacks of unbelievers, and offers grounds for its acceptance.

THERESA, ST., *b.* 1515, *d.* 1582, a Spanish saint and religious writer who had a marvellous influence both in her lifetime and since. Her example and exhortations achieved the reformation of the Carmelite convent of which she was a member, and she was persuaded to take in hand the other convents of the order. Her writings have a high reputation among Roman Catholics.

THERMOMETER, THE, is used for measuring temperatures. Its action depends on the principle that liquids expand when heated and contract when cooled. The instrument consists of a glass tube of

narrow bore having a bulb at one end. This is partly filled with mercury, alcohol, or other suitable liquid. When sufficient of the liquid has been introduced, the air in the remainder of the tube is expelled and the open end sealed up. The thermometer is graduated by first fixing the freezing-point and the boiling-point. The former is found by noting the height of the liquid in the tube after it has been kept for some time in melting ice, and the latter by observing the height to which it ascends after it has remained for some time surrounded by steam from boiling water. The distance between these two fixed points is divided into a number of equal spaces called degrees, 180 in the case of the Fahrenheit scale, the one in common use in England, and 100 in the case of the Centigrade scale. Freezing-point is marked 32° or 0°, and boiling-point 212° or 100° according to the scale adopted. The graduation is continued below the freezing-point, and the degrees are numbered downwards from 32° to 0° in Fahrenheit's thermometer, while in the centigrade instrument, temperatures below freezing-point are indicated by prefixing a minus sign to the number, e.g., —12 C. indicates 12 centigrade degrees of frost, but —12 F. represents 12 degrees below 0°, or 44 Fahrenheit degrees of frost.

THERMOPYLÆ, a famous pass, situated in the north of Greece, across which leads the only road from Thessaly to Southern Greece. It is famous for the heroic stand made there by Leonidas, at the head of 300 Spartans 480 B.C., against the whole Persian army, in which every one of the defenders perished.

THIERS, LOUIS ADOLPHE, *b.* at Marseilles, 1797, *d.* 1877, a famous French statesman and historian. As a political writer he hastened the expulsion of the Bourbons from France in 1830. Under Louis Philippe he held various cabinet posts, and was once premier. He opposed the Franco-German war of 1870-1, and Napoleon III.'s policy generally. Thiers represented France in the peace negotiations that followed the war, and subsequently, first as chief of the executive and then as President of the Republic (August, 1871, to May, 1873), his genius for finance proved of great service to his impoverished country. He was small in stature, but his brilliant powers of oratory covered all physical defects. His works include, "History of the Consulate and of the Empire," and "History of the French Republic."

THIRLWALL, CONNOP, *b.* at Stepney, 1797, *d.* 1875, bishop of St. Davids and historian of Greece, was a scholar early in life. At Cambridge he had a brilliant career. After entering the church he retained his independence, speaking for the admission of dissenters to degrees, the admission of Jews to Parliament, and the disestablishment of the Irish Church. His "History of Greece" is a monument of his learning and sagacity, and his thirty-four years' work at St. Davids a proof of his faithful service.

THIRTY-NINE ARTICLES, THE. These articles of religion contain statements on certain points of doctrine on which differences of opinion were prevalent at the time of the Reformation. In the reign of Edward VI. forty-two articles drawn up by Archbishop Cranmer were promulgated by royal authority. In the reign of Elizabeth, Convocation reduced the number to thirty-nine, and passed them in the form in which they now appear at the end of the Prayer Book. To these articles every clergyman of the Church of England has given his solemn assent.

THIRTY YEARS WAR, THE. This disastrous war, which devastated Germany from 1618 to 1648 was the outcome of the religious and political differences arising from the Reformation. The war was carried on between the Protestant States and the Catholic supporters of the German Emperor, with varying success until 1630, when a great Protestant champion appeared in the person of Gustavus Adolphus, king of Sweden. He scored success after success, but died in the hour of victory at Lützen, 1632. Oxenstiern, the Swedish chancellor, held together the Protestant States till their crushing defeat at Nördlingen, 1641. The Swedes, however, continued the war, and, aided by the French, who by the advice of the astute Richelieu had hitherto taken no active part in the contest, completely shattered the imperial power at the second battle of Nördlingen, 1645. By the treaty of Westphalia, 1648, which closed the war, France and Sweden were the chief gainers. The war left Germany in a pitiable condition of distress; Spain, the ally of the Emperor, was greatly reduced in power; and France, taking advantage of the general exhaustion, became the chief military power of Europe.

THISBE. See *Pyramus.*

THOMSON, JAMES, *b.* in Roxburghshire, 1700, *d.* 1748, a British poet. His best and longest poem is "The Seasons." The effectiveness of his best play, "Sophonisba," was quite ruined on the night of its production by the unconsciously grotesque line, "O! Sophonisba, Sophonisba O!" an apostrophe which elicted from the critics the sad reply, "O! Jimmy Thomson, Jimmy Thomson O!"

THOMSON, WILLIAM. See *Kelvin, Lord.*

THOR, one of the foremost of the Scandinavian gods, the son of Odin and Jördh (earth). He was the friend and protector of mankind. His powerful hammer, when thrown at an enemy, returned to his hand of its own accord, and the belt which he wore was one of the sources of his great strength. He was the god of thunder; and Thursday, i.e., Thor's Day, was named in his honour.

THORNYCROFT, HAMO, R.A., *b.* in London, 1850, English sculptor. He first won a name by his "Artemis," 1880. His finest works are his "Teucer," 1881, "The Mower," 1884, and his statues to General Gordon, Cromwell, King Alfred, and Gladstone.

THORNYCROFT, SIR JOHN ISAAC, *b.* at Rome, 1843, naval architect and engineer. His *Ariel*, designed in 1863, was the forerunner of the torpedo boat. The high speed now attained at sea is greatly due to his engineering improvements. He is now taking a leading part in the construction of motor vehicles.

THORWALDSEN, ALBERT BERTEL, *b.* 1770, *d.* 1844, a Danish sculptor of great excellence. From 1797 to his death he resided chiefly at Rome. His bas-reliefs and statues representing classical and religious characters are much admired. The statuary group of "Christ and the Twelve Apostles" is, perhaps, his best work. Fine specimens of his art are preserved at Copenhagen, and his "Lion" at Lucerne, commemorating the heroism of the Swiss Guards at Paris, has a world-wide celebrity.

THREAD MANUFACTURE. The principal varieties of thread manufactured are cotton, linen, and silk. In all cases yarn from the spinning machines is taken, wound upon bobbins and passed through a twisting frame which unites two yarns into one thread. The process is repeated until the thread contains the number of "cords" required. Paisley is the great centre of cotton-thread manufacture, while linen thread is chiefly made in Ulster. The thread, when completed, is usually "spooled," i.e., wound upon reels.

THREADNEEDLE STREET, in London, leads from Mansion House to Bishopgate Street Within, having the Bank of England on one side and the Royal Exchange on the other. "The Old Lady of Threadneedle Street" is a familiar title for the Bank of England.

THRESHING. In Biblical times threshing was performed by driving oxen over the threshing-floor, the tread of the animals shaking the grain from the ears. Sticks were frequently used, developing later into the flail, which consists of a stick with a shorter one fastened to it by leathern thongs. The first satisfactory threshing machine was that invented by Meikle, a Scotsman, in 1786. The mechanism consisted of an arrangement of revolving cylinders which dragged the corn to be threshed into the machine, shook and beat out the grain without crushing, and finally passed out the straw at the other end, leaving the grain on the floor below the machinery. Modern machines are the same in principle, but are much more complicated, threshing, winnowing, cleaning, weighing, and the sorting of the grains being now accomplished by the same machine.

THOROUGHBRED HORSE. See *Horse, Thoroughbred.*

THUCYDIDES (i-des), *b.* 471, *d.* 401 B.C., a famous Greek historian. His unfinished "History of the Peloponnesian War" contains many fine examples of descriptive style. His failure, as the leader of an Athenian expedition to relieve Amphipolis from the attacks of Brasidas, led to his ostracism from Athens for several years.

THUGS, a sect in India whose religion demanded the sacrifice of human victims to appease their object of worship, the goddess Kali. *Thuggee*, as this cult was called, was very prevalent until vigorous methods adopted by the Indian Government from 1826 to 1835 practically stamped it out. Thugs generally travelled about in bands disguised as traders or pilgrims, ingratiated themselves with travellers on the road, and, when a suitable opportunity arose, murdered them, usually by strangulation with a silk handkerchief.

TIARA, the triple crown of the Pope. The three crowns rise one above the other and encircle a cylindrical cap of cloth which rises to a peak and is surmounted by a mound and cross of gold. The word is also applied to any circular ornament richly jewelled and worn on the head.

TIBER, a river which rises in the Apennines, and after a course of about 250 miles in a general southerly direction flows into the Mediterranean Sea. Rome stands on its banks, and within the city it is about 300 feet wide.

TIBERIAS, a town in Palestine on the eastern shore of the Sea of Galilee. It was founded by Herod Antipas in the 1st century A.D., was for a long period a centre of Hebrew learning and, till its capture by Saladin in 1187, one of the chief strongholds of the Crusaders.

TIBERIUS, CLAUDIUS NERO, emperor of Rome, 14-37, A.D. He married Julia, daughter of Augustus Cæsar, by whom he was made heir to the imperial throne.

TIBET, a country of Central Asia consisting of a high plateau between the Himalaya and Kuen-Lun Mountains, and under the suzerainty of China. Lamaism (a form of Buddhism) is the prevailing religion, and the government is in the hands of the Dalai-Lama (the high-priest). The valley of the Sanpo, in whic stands Lhasa the capital, is the only fertile district. The industries are mainly pastoral, yaks, goats, and sheep being reared. A

great objection to the intrusion of foreigners is a marked feature of the people. Failure, on the part of the Tibetans, to fulfil the terms of a treaty made with the Indian Government in 1890, combined with the interception of secret communications between Russia and Lhasa, led, in 1904, to the dispatch of the military explorer, Colonel Younghusband, to Tibet, accompanied by an armed force of 2,500 troops. After much fighting with the brave but ignorant natives, the force reached Lhasa, and after the signing of a new treaty with the Tibetan authorities, recrossed the Himalayas before the end of the year.

TICHBORNE TRIAL, the longest trial held in England. It arose from a claim made by a butcher from Australia named Orton to the Tichborne estates, worth about £24,000 a year. On the death of Sir Alfred Tichborne in 1866, Orton came forward as his elder brother, Roger, supposed to have been lost at sea, and was acknowledged by the dowager-lady Tichborne as her lost son. The trial began 11th May, 1871, and was not concluded until 6th March, 1872, the 103rd day of the trial, when the claimant was declared non-suited. The proceedings cost the estate at least £90,000. Orton was then put on his trial for perjury and forgery. In it Sir Henry Hawkins (now Lord Brampton) for the prosecution, and Dr. Kenealy for the defence, greatly distinguished themselves. After a trial lasting 188 days, at a cost of nearly £60,000, Orton was sentenced to 14 years penal servitude, 28th February, 1874. Eventually he admitted his imposture and towards the end of his life got his living as a barman. He died, 1898.

TICKET OF LEAVE. Refer to *Index*.

TIDES, the periodic rise and fall of the waters of the ocean due to the attraction of the sun and moon, by which a wave motion is set up which traverses the oceans and causes the level of the water at points on the coast to vary. Two tides, under ordinary conditions, occur daily, but high water is fifty minutes later each day. The sun, as a tide producer, is much less effective than the moon. At new moon and full moon the relative position of sun and moon is most favourable for united action. Consequently, at these times occur the highest tides, known as the *Spring Tides*, whereas at half-moon occur the tides known as *Neap Tides*, which fail to reach the average height. The height of the tidal wave also varies with the area of the mass of water in which it moves. In mid-Atlantic it is about 12 feet high, in mid-Pacific from 3 to 4 feet. In shallow seas and funnel-shaped bays and estuaries in free communication with the ocean the height of the tidal wave is often much higher. In the case of the Bay of Fundy, for instance, at the time of Spring Tides, there is a difference of level of 70 feet between high and low water. Land-locked seas, as the Baltic and Mediterranean, are practically unaffected by the tidal wave of the ocean, and have merely slight tides of their own.

TIERRA DEL FUEGO, an archipelago off the Southern extremity of South America, from which it is separated by the Straits of Magellan. The name, signifying "The Land of Fire," was given to it by Magellan, probably from the number of signal fires lighted by the natives along the coast. The natives are in a degraded state of barbarism, but are extremely hardy, bearing the intense cold of winter with very little covering.

TIERS ÉTAT, formerly the third estate of the realm of France, the two others being the nobility and clergy. At the French Revolution, 1789, deputies of the down-trodden *tiers état* assembled for the first time during nearly 200 years, formed themselves into the National Assembly and took the Government into their own hands.

TIGRIS, a river of Asiatic Turkey, which rises in the mountains of Armenia, and after a course, generally south-west, of 1,100 miles, joins the Euphrates at a point 100 miles from the Persian Gulf, into which the united streams flow. In ancient times, its waters were used to irrigate one of the most fertile and densely-populated districts of the world. Bagdad and Mosul are on its banks.

TILBURY FORT, in Essex, on the Thames, opposite Gravesend. Henry VIII. erected the first regular fortification here in 1539. This was added to by Elizabeth, who reviewed her troops here in 1588 after the Armada had been scattered. In 1667, and at intervals since, additions have been made until Tilbury Fort is one of the strongest in England.

TILLOTSON, JOHN ROBERT, *b.* 1630, *d.* 1694, was famed for his eloquence as a preacher. In the reign of Charles II. he preached against the Declaration of Indulgence and in favour of the Exclusion Bill. When the Revolution was accomplished he became a great favourite with William III., and was made Archbishop of Canterbury on Sancroft refusing to take the oath of allegiance.

TILSIT, a small town on the Niemen, in East Prussia. Here, on a raft in mid-stream, in 1807, took place the famous compact between Napoleon and the Emperor Alexander of Russia, by which Prussia was deprived of her Polish provinces and possessions east of the Elbe, forbidden to trade with England, and reduced to a second-rate power. The trade of Tilsit in grain and timber is considerable.

TIMBER. The great drain made on English forests before the general application of iron to ship-building and coal to smelting purposes has rendered England almost entirely dependent on foreign countries for her timber supply, the annual imports in this respect amounting in value to over 25 million pounds. Many varieties of pine are imported in vast quantities: red-wood from the Baltic ports and California, white-wood from Russia, Douglas firs for ships' masts from British Columbia, pitch pine from the Eastern United States, and Kauri pine from New Zealand. Of woods used in cabinet-making and decorative woodwork, walnut from the south of Europe, rose-wood from Brazil, mahogany from Central America, satin wood from the West Indies and Ceylon, and ebony from the Congo forests and Ceylon are largely imported. The hard, durable teak, used so much in ship-building, comes chiefly from India, Burma, and Siam.

TIMBUKTU, a large town in the French Sudan, about 10 miles north of the Niger, chiefly inhabited by negroes and Arabs. Its caravan trade with Guinea and the northern coasts of Africa in gold, gum, and ivory is very large; population about 20,000.

TIME, in its general sense, is divided into days, months, and years, and is measured by the regular recurrence of certain astronomical phenomena. In its narrower sense, the number of hours, minutes, &c., from some fixed point of time in each day, it is measured chiefly by clocks and watches. In computing the relative times of places differing in longitude, three facts must be considered: (1) The rotation of the earth is from west to east. (2) A complete revolution of the earth on its axis takes 24 hours. (3) Noon occurs at the same time at all places on the same meridian. Hence (1) places east of a certain town have noon before it, and places west, after it. (2) The difference of time is found by reckoning 4 minutes for each degree of longitude separating the places, irrespective of the latitude. If it be 9 p.m. Monday, at Greenwich, at Melbourne 145° east, the time will be 6.40 a.m. Tuesday, while at New Orleans, 90° west, the time will be 3 p.m. Monday. For convenience all places in the British Isles keep Greenwich time, France takes the time from Paris, while Germany and Switzerland reckon according to central European time, which is one hour earlier than that at Greenwich. See "Relative Times" in *Index*.

TIME IMMEMORIAL, or "time out of mind." In English law any right is considered immemorial unless it can be proved to have arisen since the accession of Richard I., 1189.

TIMES, THE, a newspaper of great weight, founded in 1785 under the name of "The London Daily Universal Register," which title was changed to the present one in 1788. Under the direction of John Walter, who took it over in 1803, it became the leading London journal and gained a great reputation for the reliability of its news and the interest of its articles, a reputation which it has ever since maintained under the guidance of the Walter family.

TIMOTHY, the disciple and fellow missionary of St. Paul, was born in the province of Lycaonia in Asia Minor. He accompanied St. Paul to Philippi, Athens, and Corinth. He was with the apostle during his first imprisonment at Rome, for he is mentioned by name in St. Paul's Epistles to Philemon and the Philippians, written from that city. Two pastoral Epistles were addressed to him by St. Paul, who had left him at Ephesus to take charge of the Church there.

TIMUR, *b.* 1333, *d.* 1405, a Tartar chieftain who in 1370 became ruler of the district round Samarkand, and later conquered almost the whole of Central Asia. His campaigns were marked by great cruelty and bloodshed, but his encouragement of learning at his capital, Samarkand, proves him to have been not utterly devoid of civilized qualities. He conquered Persia, the greater part of India, defeated and took prisoner at Angora, in Asia Minor, Bajazet I., Sultan of Turkey, and at his death his territories extended from Moscow to the Great Wall of China.

TIN, a soft white metal used largely in the making of alloys such as bronze, pewter, Britannia-metal, gun-metal, etc. The principal ore from which it is extracted is tin-stone, a compound of tin and oxygen. The Cornish tin mines, once well known, are now nearly exhausted, the Malay Peninsula being the chief source of England's supply. Large quantities are used in the preparation of tin-plate.

TINDER, a substance which readily smoulders when a spark is dropped on it. Before the invention of lucifer matches cotton rags partially burnt were largely used as tinder, in England, for procuring a light. A spark was produced with flint and steel and allowed to drop into a box containing the tinder, and a thin slice of wood tipped with sulphur on being applied to the smouldering tinder readily caught fire.

TINNED MEATS. See *Canning*.

TIN PLATE, specially prepared sheets of steel plate, coated with tin and used for household utensils, cans for preserving fish, and many other purposes. The steel

plates are dipped into melted tin, the latter being distributed evenly over the surface, by passing the plate when cool between polished steel rollers. Tin is very slowly oxidised, and thus rusting is retarded. Llanelly, in South Wales, is a great centre of tin plate manufacture.

TINSEL, very thin pieces or strips of a glittering metal or an alloy—not often gold or silver—used on account of their brilliant effect in ornamentation. The name is also used for cloth in which the threads are interspersed with threads of glittering metal. Used metaphorically, it implies something showy and of little sterling worth.

TINTAGEL, a parish in Cornwall, 5 miles north-west of Camelford. On Tintagel Head stands the ruin of that castle where King Arthur is said to have held his court. It is first mentioned by Geoffrey of Monmouth (A.D. 1150).

TINTERN ABBEY, a splendid ruin in the midst of beautiful scenery on the right bank of the Wye, Monmouthshire. It was founded in 1131 by a Cistercian brotherhood, and at the dissolution of the monasteries in 1539, fell to the Earl of Worcester. It was purchased from the Duke of Beaufort in 1903 by the Crown.

TINTORETTO, *b.* 1512, *d.* 1594, a famous Venetian painter. His real name was Jacopo Robusti, the name Tintoretto arising from the fact that his father was a dyer. For some time he was a pupil of Titian, but his style is entirely original. Of his numerous works—he was a remarkably rapid worker—"The Crucifixion," "The Marriage of Cana," and "The Last Supper" are, perhaps, the most admired.

TINWORTH, GEORGE, *b.* in London, 1843, was in early life a wheelwright. He took to wood-carving, and became a student at the Lambeth School of Art, and later at the Royal Academy. While studying at Lambeth his figures and groups attracted the attention of Mr. Doulton, whose Art Pottery works he soon entered. His productions in terra-cotta and stone-ware are much esteemed.

TIRAH CAMPAIGN, a campaign conducted in 1897, by Sir William Lockhart, against the Afridis, on the N.W. frontier of India. The capture of the Dargai Heights by the Gordon Highlanders is memorable. See *Afridis*.

TITANIA. See *Oberon*.

TITANS, in Greek mythology, are the six sons and six daughters of Uranus (Heaven) and Ge (Earth). Led by Kronos (Saturn) they overthrew Uranus, but were in turn overthrown by Zeus (Jupiter), son of Kronos, and confined in Tartarus. Keats's fragment, "Hyperion," deals with the Titans after their fall.

TITHES, originally the tenth part of the annual produce of an estate, payable by the owner or tenant for the maintenance of religion. In England, the earliest example of the legal recognition of tithes is a decree of a synod in 786. The earliest mention of tithes in statute law is in 1285. The Tithe Commutation Act was passed in 1836, substituting a rent-charge, varying with the price of corn, for the payment in kind. Owing to the difficulties experienced by the clergy in collecting the tithe dues, an Act was passed, in 1891, transferring the payment of tithes from the tenant to the landowner. Refer to "Tithes" in *Index*.

TITIAN VECELLIO, *b.* 1477, *d.* 1576, one of the leading Italian painters. In landscapes, portraits, and groups of figures he was equally successful, and all his works are marked by the most exquisite colouring. Included among his masterpieces are "The Sleeping Venus," "Christ in the Garden," "Sacred and Profane Love," and "The Last Supper."

TITUS, a disciple and fellow-missionary of St. Paul, who in the last year of his life, 67 A.D., wrote his Epistle to Titus.

TITUS FLAVIUS, *b.* 40, *d.* 81 A.D., a Roman emperor revered for his personal qualities and for his ability as a ruler. He served under Vespasian, his father, in the war against the Jews, and on Vespasian becoming Emperor, his son took command and captured Jerusalem, 70 A.D. He was associated with his father in the government for a few years, and became sole Emperor, 79 A.D.

TOBACCO, the prepared leaves of certain plants of the genus Nicotiana, whose narcotic effects are due to the presence of a poisonous alkaloid called *nicotine*. The habit of tobacco smoking was introduced into England about 1586, on the return of Drake from Virginia, and thence spread through Europe in spite of royal edicts and the denunciations of the Church. Nearly 4 million pounds worth of raw tobacco, consisting of whole leaves, packed in barrels, is imported annually into England, the average annual consumption for the past five years being 30 ounces per head of the population. Virginia, Maryland, and Carolina are our principal sources of pipe and cigarette tobacco; Cuba, the Philippine Islands, and India supply cigars and tobacco used in their manufacture; the Turkish Empire grows excellent cigarette tobacco, much of the Turkish tobacco being sent to Egypt, there prepared, and exported as Egyptian produce; France, Germany, and Holland grow tobacco on a large scale, but the quality, as a rule, is inferior and the flavour unpleasant; Russian cigarette tobacco is of good quality and commands a ready sale in Germany. The ribs and stems of tobacco leaves are largely used in the manufacture of snuff.

TOBACCO PIPES, in their simplest form, consist of a hollow bowl to contain the tobacco, and a hollow stem by which the smoke is drawn through a hole in the bottom of the bowl. The most popular English pipe, the briar, is made from the knotty root of heather (Fr. *bruyère*) specially grown in the Pyrenees and Italy. Tobacco, when burning, gives out a natural oil which contains nicotine, and the absorption of this oil by the smoker is one of the most unpleasant features of the smoking habit. Bowls made of clay or meerschaum absorb the oil much better than briars, but the latter are more durable. Many ingenious inventions, some theoretically perfect, have been made to overcome this objection, but the simple, workable pipe that absorbs all moisture is yet to come. The stationary hookah, used largely in the East, has a vessel containing water between the bowl and the stem, and the passage of the smoke through the water removes most of the harmful impurities.

TOBOGGANING, "coasting" down a snow-covered slope on a toboggan, a simple kind of sledge without runners, consisting of a thin single length of wood (or two boards joined together), curved backwards in front, and guided in its descent by the steersman's foot, dragging behind, toe downwards.

TODLEBEN, FRANZ EDWARD, *b.* 1818, *d.* 1884, a Russian general with great engineering abilities, which had full play during the prolonged resistance he enabled the Russians to make at Sebastopol, in the Crimean War, 1854-5. He supervised the fortification of Kronstadt, which guards the water-way to St. Petersburg. In the Russo-Turkish war he conducted the siege of Plevna, 1877, and a year later was appointed commander of the Russian forces in Turkey.

TOGO, ADMIRAL, *b.* 1857, the Nelson of Japan, came to England as a cadet on the "Worcester" in 1873-74, and on his return did much to create the Japanese Navy. As Rear-Admiral he did good service in the war with China, but his services in the war with Russia were inestimable, ending with the annihilation of the Baltic Fleet (May 27-8, 1905).

TOKAY, a small town in Hungary on the Theiss, celebrated for the wine that bears its name, the volcanic soil in the vicinity being favourable to the growth of the vine.

TOKIO, the capital of Japan since 1869, lies in a low, fertile plain at the head of the Bay of Tokio. The city is intersected by the river Sumida and many canals. It contains the Imperial Palace and a large university, and has all the appliances of Western civilization. The manufacture of silk goods, cotton goods, porcelain, matches, lacquer-ware, and machinery is carried on. Most of the foreign trade passes through its port, Yokohama; population exceeds 1½ millions.

TOLEDO, an ancient city of Spain, built on seven hills overlooking the Tagus. It is still famous for its swords. It contains a splendid 13th century cathedral and the remains of the *Alcazar*, the ancient palace of the Moorish kings. Both the Visi-goths and the kings of Castile made it their capital, and under the Moorish rule it was the second city of the country; population 20,000.

TOLERATION, ACT OF, an act passed by the English Parliament soon after the Revolution of 1688, removing many of the disabilities under which Protestant Dissenters from the Church of England had laboured. Those who took the oaths of allegiance and supremacy were, by this Act, allowed freedom of worship.

TOLL, originally any kind of tax, but now applied to a charge demanded for the enjoyment of certain privileges, such as landing at a pier, using a market-place for the sale of goods, crossing a bridge, etc. The highways of England were formerly maintained in good condition by tolls levied upon travellers at various points, guarded by gates, along each road, but since the beginning of the 19th century this system has been almost entirely superseded by charging road-maintenance to the local rates.

TOLSTOI, COUNT, *b.* 1828, a Russian novelist and social reformer keenly interested in the regeneration of the world in general, and of Russia in particular. He was educated at Kazan University, and was present at the siege of Sebastopol in 1855. After the war, he renounced the usual life led by wealthy Russian nobles, and settling down on his estates has since shared in the life and the work of the peasants there. "War and Peace," "Anna Karénina," "Resurrection," and "The Kreutzer Sonata" are works that testify to the passionate earnestness of their author.

TOMAHAWK, the light war-axe of the North-American Indians, formerly made with a stone head attached to the handle by strips of hide. The Indians had great skill in throwing these weapons, hitting an object with the sharp edge at a considerable distance. Their usage has supplied us with the metaphor "to bury the hatchet," meaning to "make peace."

TOMATO, a plant introduced into Europe from South America early in the 16th century. Its cultivation, for the sake of its fruit, has greatly increased in England in recent years. Tomatoes can be grown out of doors in the South of England, but for the most part they are produced in glass houses.

TOMMY ATKINS, the familiar name used for any private of the British army, as "Jack Tar" is used for a sailor.

TONE, THEOBALD WOLFE, *b.* 1763, *d.* 1798, an Irish patriot and conspirator. In 1793 he helped to establish the "Society of United Irishmen," and did much to prevail on the French to send troops to Ireland to aid the Irish in gaining independence. He took part in a French expedition sent to invade Ireland in 1798. He was made prisoner and taken to Dublin, where he committed suicide.

TONGKING, or **TONKIN,** a colonial possession of France in Indo-China, acquired in 1884. Rice, silk, and cardamoms are exported, and sugar, coffee, cotton, and tobacco grown. Minerals, especially copper, are plentiful. Area, 46,000 square miles; population, over 7,000,000, including 4,000 Europeans.

TONNAGE. The registered tonnage of a vessel is estimated by dividing the number of cubic feet of space contained in the vessel by 100. The tonnage determines the amount payable by the vessel in dock dues, canal tolls, etc. By the Merchant Shipping Acts of 1854 and 1894, careful instructions are given by which the Board of Trade officials are to measure the cubic capacity of vessels to be registered. A vessel whose capacity is 500,000 cubic feet would be 5,000 tons register.

TONNAGE AND POUNDAGE, duties on wine and other merchandise imported into the Kingdom. The amount was usually 3s. on a tun of wine and 1s. in the pound on the value of other articles. These duties were first granted to Henry V., and afterwards to succeeding kings. As these taxes had always been granted to previous kings for life. Charles I. was indignant at their being granted to him for one year only. These general charges were discontinued in 1787, and a specific duty imposed on each article imported.

TONSURE, the removal, by shaving, of a circular patch of hair from the top of the head; the bare space itself is sometimes called the tonsure. Priests of the Roman Catholic and Greek Churches are tonsured.

TONTINE, a form of annuity named from its inventor, Lorenzo Tonti, an Italian banker resident in Paris, in the 17th century. A number of members subscribe to a loan, the interest being paid annually by the borrower. As the number of lenders decreases, through death, the interest paid to each survivor increases, the last survivor drawing the whole of the interest on the sum originally lent. At the death of the last member of the tontine, the capital falls to the borrower.

TOOLE, JOHN LAWRENCE, *b.* in London, 1832, *d.* 1906, the most popular low-comedian of his day. He made his first appearance in London, at the Haymarket Theatre, in 1854. Among his more noted impersonations were Mr. Spriggins, Caleb Plummer, Joe Bright, and Dick Dolland. In 1879 he became lessee of Toole's Theatre, London, where for many years he contributed largely to the merriment of crowded houses.

TOPAZ, a silicate of aluminium in which fluorine is present. It is harder than quartz, and though comparatively abundant is classed among precious stones, some being transparent and others barely translucent. White, yellow, green, and blue topazes of varying shades occur. Besides Brazil, the Ural, Altai, and Erz-Gebirge mountains are the chief sources of supply.

TOPHET, a name given to the gloomy ravine of Hinnom or Gehenna, south of Jerusalem, where in the reign of Manasseh and other evil kings the idolatrous Israelites sacrificed their first-born to Moloch. The children were first slain and then burned. The rabbinical story of the calf-headed brazen image of Moloch, in which the children were burned alive, is pure fable. The name "Tophet" is probably derived from *tophteh*, a pyre.

TORIES. This designation for a political party arose during the struggle in 1681 over the Exclusion Bill. The Court party, supporters of Charles II. and in favour of the succession of the Duke of York, dubbed their opponents Whigs, i.e., psalm singing Covenanters. The Whigs retaliated by addressing their opponents as Tories, i.e., thieving Irish moss troopers. The names were retained to designate the two parties in Parliament, their contemptuous signification gradually being lost. The word Tory is still occasionally used, but the term "Conservative," introduced during the Reform Bill struggles in 1832 has almost entirely displaced it.

TORONTO, the capital of the province of Ontario, on the north-west coast of Lake Ontario, and, with the exception of Montreal, the largest city in Canada. It has a large output of iron, engines, and machinery, and a considerable transit trade by rail and water; population exceeds 200,000.

TORPEDO, a steel, cigar-shaped vessel charged with an explosive, and fitted with means of propulsion enabling it to move through the water towards the object against which it is directed. The Whitehead torpedo, of which those used in the British navy are modifications, consists of three chambers; the pointed head contains a charge of gun-cotton, the middle chamber contains the machinery which drives the propellor of the torpedo, and the third chamber contains compressed air to drive the machinery. The torpedo is fired from a tube fixed either above or below the water line, and as soon as the torpedo enters the water its propeller begins moving. The torpedo can be adjusted to keep at any required distance below the surface. Contrivances, in which the gyroscope figures prominently, have been invented for keeping the torpedo on the course intended. At present, it is probably the most deadly of the weapons used in naval warfare.

TORQUAY, a watering-place on Tor Bay in Devonshire, noted for its mild climate, its subtropical plants growing in sheltered places, its picturesque scenery, and its equable temperature. It is accordingly a favourite winter resort for invalids and consumptive patients; population exceeds 35,000.

TORQUE, a bracelet, armlet, or collar of gold, usually twisted into the form of a snake, and worn by ancient races, especially the ancient Celts and Germans. They are occasionally dug up in Great Britain, Ireland, and other countries of north-west Europe.

TORQUEMA'DA, TOMAS DE, *b.* about 1420, *d.* 1498, a Dominican prior who was the first to be appointed head of the Spanish Inquisition by Ferdinand and Isabella. His career was marked by great cruelty and oppression in his relentless pursuit of heretics.

TORRES VEDRAS, a small town in Portugal, 25 miles north-west of Lisbon, rendered famous by the double line of fortifications constructed by Wellington in 1810. These lines protected Lisbon, and gave Wellington a sure refuge when hard pressed by Marshal Masséna.

TORRICELLI, EVANGELISTA, *b.* 1608, *d.* 1647, a famous Italian scientist and mathematician, and a pupil of Galileo. The barometer was invented by him for measuring the pressure of the atmosphere, the phenomena of which pressure he was the first to explain. From this circumstance the vacuum in the tube of a barometer is named the "Torricellian vacuum."

TORTOISE, an animal distinguished by its horny shell supplied with holes through which the head and limbs project, and into which they can be drawn at will. The upper and more convex portion of the shell, the *carapace*, is in most cases covered with horny plates, which provide the article of commerce known as "tortoise-shell"; the lower portion is called the *plastron*. The tortoise proper is a land animal, seldom exceeding one foot in length, and is native to the Eastern countries of the Mediterranean. The turtle, a large species of tortoise which sometimes attains a weight of 200 lbs., is aquatic in its habits, though its eggs are deposited on land. The flesh of the Indian turtle is much esteemed as an article of food.

TOTEMISM. Refer to *Index*.

TOUCHSTONE, a hard kind of flinty slate found in Asia Minor anciently relied on, and still used, for testing gold. The purity and fineness of the gold is estimated by the appearance of the streak it makes when rubbed on the stone.

TOULON, a strongly fortified naval station on the south coast of France. It possesses two good roadsteads and a fine harbour, and is the head-quarters of the French Mediterranean fleet. In 1793 the Royalists, with the help of a British fleet, defended it unsuccessfully against the Republicans, with whom Napoleon Bonaparte served as an artillery officer; population exceeds 100,000.

TOULOUSE, an ancient city on the Garonne, in the south of France. Its central position on the railway between the Mediterranean and the Bay of Biscay, and at the junction of two important canals, makes its transit trade, especially in grain, hay, and wine, considerable. Woollen and silk goods, leather, and brandy are manufactured. Here, in 1814, the French were defeated by Wellington; population 150,000.

TOURNAMENT, a favourite sport of knights in the days of chivalry. The tournament proper consisted of a friendly battle between two parties of mounted knights, usually armed with blunted lances only. Occasionally the contest had all the character of real warfare, in spite of well-defined rules regulating the sport. Contests between single knights were known as *jousts*. Tournaments doubtlessly kept alive the military spirit, but with the decline of the Feudal System, they lost popularity, and disappeared during the 16th century. Scott's "Ivanhoe" contains a fine description of a 12th century tournament.

TOURS, a well-built city of central France, on the Loire. After the Reformation it became a flourishing Huguenot centre, but the revocation of the Edict of Nantes, in 1685, did lasting injury to its industries by forcing over 30,000 of its inhabitants to flee to foreign countries. Its trade is still considerable, and silk goods and carpets are manufactured. Near Tours, the crushing victory of Charles Martel over the Saracens, in 732, effectually stopped the advance of Mohammedanism north of the Pyrenees; population about 65,000.

TOWER OF LONDON, THE, one of the best preserved of mediæval citadels, stands on the north bank of the Thames. It consists of several buildings and towers, enclosed with high battlemented walls, the whole being surrounded by a moat. The oldest and most imposing part, the White Tower, was built by William I., and the remaining parts were erected at intervals up to the end of the 13th century. The entire space covered is about 13 acres.

Its close association with English history makes it a highly interesting monument, and the museum, in particular, containing specimens of mediæval armour and weapons, is full of interest, and so also is the room in which the regalia and Crown jewels are kept.

TOWTON, a village in Yorkshire, about midway between Leeds and York, the scene of Edward IV.'s victory, in 1461, over the Lancastrians, by which he made secure his position on the throne.

TOYNBEE HALL, an institution in Commercial Road, Whitechapel, London, built in 1885 to commemorate and continue the work of the practical social reformer, Arnold Toynbee, an Oxford graduate who devoted the best part of his short life to the poor of the East End. The work of introducing a little intellectual brightness into the dull depressing lives of the poor "East-Enders," amid their squalid surroundings, by means of lectures on economical subjects, concerts, and clubs, is carried on chiefly by young Oxford and Cambridge graduates, resident in the institution, who devote their spare time to this noble task.

TRACTS FOR THE TIMES, a series of 90 tracts, written and published between 1833 and 1841 by Newman, Keble, Pusey, and other leaders of the Oxford Movement (which see).

TRADE MARKS. Refer to *Index*.

TRADE UNIONS. Refer to *Index*.

TRADE WINDS, the name given to certain more or less permanent winds which blow respectively south-west and north-west towards the equator from two high pressure belts lying about 30° north and 30° south. In the open ocean and in the level Sahara the trade-winds are practically permanent, but the presence of elevated land masses interferes with their otherwise regular course, as in the case of India and north-west Australia. In equatorial regions, the great heat of the sun, and the consequent presence of a high percentage of water vapour in the air over the ocean, cause the air there to be comparatively light. A movement of air towards the low pressure belt at the equator is set up, giving rise to the trade winds. The apparent north-westerly and south-westerly directions of the trades is due to the rotation of the earth from west to east.

TRAFALGAR, BATTLE OF, a naval battle fought October 21st, 1805, off Cape Trafalgar, in the south-west of Spain, in which Lord Nelson won a memorable victory over a combined French and Spanish fleet. The destruction of his fleet led Napoleon to abandon his project of invading England with the great armament he had collected at Boulogne. See *Nelson*.

TRAJAN, a Roman Emperor who succeeded Nerva in 98 A.D., and died 117 A.D. He was an enlightened ruler and a good administrator. *Trajan's Arch*, over the Appian Way, at Benevento, Italy, is a beautiful arch of white marble, with sculptures representing scenes from Trajan's life and reign. *Trajan's Column* is a marble column, in Rome, on the shaft of which are bas-reliefs ascending in a spiral and representing Trajan's wars and triumphs.

TRAMWAYS. specially prepared tracks laid down in streets and roads over which vehicles called "trams" may run with greater ease than over the ordinary road. Parallel iron rails grooved to accommodate a corresponding ridge on the wheels of the tram form the chief feature of tramways. They were first introduced into England about 1860 for passenger traffic. Trams drawn by horses, others driven by steam, and others again drawn by an endless cable laid underground have been introduced, but these are being gradually replaced by the electric tram. Many municipal authorities have, during the last decade, acquired control of the tramway system in towns, and, so far, have met with great success. At the beginning of 1904, nearly 1,500 miles of tramway were in use in the United Kingdom.

TRANSMIGRATION OF SOULS. Refer to *Index*.

TRANSUBSTANTIATION. The doctrine of transubstantiation is to Protestants the most distinctive doctrine of the Roman Catholic Church, as is evidenced by the prominence given to it in many acts of religious intolerance passed in England after the Reformation. It is explained in the following canon drawn up at the Council of Trent: "If any one shall say that in the most holy sacrament of the Eucharist, there remains the substance of bread and wine together with the body and blood of our Lord Jesus Christ; and shall deny that wonderful and singular conversion of the whole substance of the bread into the body, and of the whole substance of the wine into the blood, the species of bread and wine alone remaining—which conversion the Catholic Church most fittingly calls Transubstantiation—let him be anathema." *Species*, in this definition, means appearance, being a word derived from L. *specio*, I see.

TRANSVAAL, an extensive inland territory in South Africa, between the Vaal and Limpopo Rivers, and since the Boer War forming part of the British Empire. In build it is an elevated plateau with mountainous districts in the south and south-east. Stock raising and gold mining are the leading industries. Pretoria, the capital, and Johannesburg, the gold mining centre, are connected by rail with Lorenzo Marques, Cape Town, and other sea-ports. The climate is dry but healthy. Refer to "Transvaal" in *Index*.

TRAPPISTS, a religious order marked by its extreme austerity of life. The order originated in the Cistercian Abbey of La Trappe, in Normandy, with the introduction of its stern religious system by De Rancé, abbot of La Trappe, in the middle of the 17th century. Numerous Trappist houses exist in various countries of the world.

TRAWLING. See *Fishing*.

TREAD-MILL, a long, hollow cylinder revolving on a horizontal axis, formerly in use as a means of punishment in penal establishments. The surface of the tread-mill is fitted with planks attached horizontally which serve as steps for the feet of the prisoners, who, gripping a horizontal bar fixed overhead, keep the tread-mill revolving by their weight. This involves the compulsory lifting of the feet from step to step as the mill turns round.

TREASURE TROVE, treasure discovered hidden in the ground or elsewhere, the owner of which cannot be traced. Treasure, so found, belongs by law to the Crown, and retention on the part of the finder is a punishable offence. A reward, equivalent in value to the treasure handed over, is usually paid by the Crown.

TRENCH, RICHARD CHEVENIX, *b.* 1807, *d.* 1886, was educated at Harrow and Cambridge. After being Professor of Theology at King's College, London, and Dean of Westminster, he spent his last twenty years as Archbishop of Dublin. His theological works, especially those on the "Parables" and "Miracles" are of great value, and so are his writings on English, especially his "English Past and Present," and "The Study of Words."

TRENT, COUNCIL OF, a famous Council of Roman Catholic bishops which met at Trent, in the Tyrol, at intervals stretching over the period 1545 to 1563, and settled there the discipline and doctrines of Roman Catholicism. The result of their deliberations is contained in the Creed of Pope Pius IV.

TREPANG. See *Bêche de Mer*.

TREVES, SIR FREDERICK, *b.* at Dorchester, 1853, a celebrated surgeon. In 1900 he went to South Africa as consulting surgeon to the British army, and two years later he operated on King Edward for appendicitis, and thus gained a baronetcy. In 1905 he was elected Lord Rector of Aberdeen University. He has written valuable works on anatomy and surgery.

TRÈVES, or **TRIER,** an ancient German city, on the Moselle, in the Rhine Province, Prussia. It contains many relics of the Roman occupation, which dates from the reign of Augustus. Its old cathedral contains the Holy Coat of Trèves, said to be the seamless Coat of Christ. In the Middle Ages the archbishops of Trèves had princely powers and took a prominent part in the politics of the Empire; population 40,000.

TRICOLOR, the flag of the French Republic, first adopted by the National Assembly in 1789. It consists of three vertical bands, the colours being red, white, and blue. The tricolor is said to have been invented by Mary Queen of Scots for the Swiss Guards in France. The white was for France, the blue for Scotland, and the red for Switzerland.

TRIDENT, the three-pronged sceptre borne by Poseidon (Neptune) to symbolise his sovereignty of the sea, with which idea it also figures in the representation of Britannia.

TRIDENTINE COUNCIL. See *Trent, Council of*.

TRIENNIAL ACT, an act passed by the Long Parliament in 1641, limiting the maximum duration of Parliament to three years, and similarly the maximum interval between successive Parliaments. This Act was repealed in Charles II.'s reign, but a second Triennial Act was passed in 1694. The latter was repealed in 1716, when was enacted the Septennial Act, still in force.

TRIER. See *Trèves*.

TRIESTE, the chief port of Austria and the foremost of the Adriatic ports. It has good harbour accommodation, and is the head quarters of the Austrian Lloyd Steam Navigation Company, which trades largely with India. Most of the export and import trade of Austria-Hungary passes through Trieste; population 134,000.

TRINIDAD. Refer to *Index*.

TRINITY COLLEGE. (1) The largest college of Cambridge University, founded by Henry VIII. in 1546. Bacon, Newton, Dryden, Macaulay, and Tennyson studied at this famous college. (2) A college of Oxford University, founded in 1554 on the site of an older institution, Durham College, which was suppressed during the Reformation. (3) A college at Dublin, founded by Queen Elizabeth in 1591, as the nucleus of Dublin University. No additional colleges were afterwards founded, and consequently the university consists of but one college.

TRINITY HOUSE, a corporation with considerable controlling powers over the mercantile marine of the United Kingdom, so called from its head-quarters being at Trinity House, on Tower Hill. By a royal charter granted in 1514, it is empowered to supervise the protection of the coasts of England and Wales with lighthouses, light-ships, and buoys, to grant licenses to pilots, and to keep the water-ways round the coast clear of wreckage and other obstructions. The corporation consists of officers chosen from the Navy and the Merchant service, besides a considerable number of men of high social position.

TRIPOS, the system adopted at Cambridge University of dividing the successful candidates for "honours" at the examination for the degree of Bachelor of Arts, into three classes. In the mathematical tripos, "Wranglers," "Senior Optimes," and Junior Optimes" are the terms used for designating the three classes respectively.

TRIPTYCH (ch=k). a word from the Greek signifying "thrice-folded." It is applied to a set of tablets or pictures, two of which fold over and cover the middle one. Triptychs are often used for altar pieces, the middle picture being complete, and the two side ones subsidiary.

TRIREME, a war-vessel used in ancient times, propelled by oars arranged in three banks or tiers. The prow was specially constructed for ramming purposes, though the Romans in their war with the Carthaginians, adopted and perfected grappling tactics. In "Ben Hur," by Lew Wallace, is a good description of an action in which such vessels figure.

TRISAGION (Gk. "thrice holy"), properly a hymn forming part of the Liturgy of the Eastern Church, so called because the word "Holy" occurs three times in each verse. The name is often erroneously applied to the "Tersanctus" ("Holy, Holy, Holy,") of the Western Eucharistic service.

TRISMEGISTUS. See *Hermes.*

TRITON, in Greek mythology, the son of Poseidon (Neptune) and Amphitrite. His descendants, known as "tritons," figured as attendants on the greater sea-deities and possessed composite bodies, the upper part being human, the lower part that of a fish.

TRIUMPH, an honour granted to victorious generals by the Roman Senate. It consisted of a grand procession of the general and his victorious army, preceded by the Senate, the spoils of war, and the captives, from one of the gates of the city to the Capitol, where sacrifices were offered to Jupiter. A general holiday was declared, and everything done to honour the victor and foster military spirit.

TRIUM'VIRATE, a union or combination of three men in office or authority. Commissions of three (triumviri) were quite common at Rome for such purposes as planting a colony, superintending the coinage, etc. But the name is specially reserved in history for the commission consisting of Antony, Octavius, and Lepidus, appointed to restore order after Cæsar's death.

TRIVIUM, the name applied in the Middle Ages to Grammar, Rhetoric, and Logic, the first three of the seven subjects whose acquisition was considered necessary to a complete education. The remaining four, Arithmetic, Music, Geometry and Astronomy formed the *quadrivium.*

TROGLODYTES, uncivilised races who make their dwellings in caves. Evidence is plentiful to prove that in the remote past almost every habitable part of the world had its cave-dwellers, but the term "troglodytes" is used specially by the ancient Greeks for contemporary races dwelling on the confines of Greece and her colonies.

TROJAN WAR. See *Troy.*

TROLL, in Scandinavian folk-lore, a mountain dwarf of mischievous propensities. In the earliest legends, a troll is a giant.

TROLLOPE, ANTHONY, *b.* in London, 1815, *d.* 1882, a prolific English novelist. He served for over thirty years in the Postal Service, during which time his experiences in Ireland and abroad provided materials for his numerous novels. His works dealing with his travels in the West Indies, South Africa, Australia, and New Zealand contain many fine descriptive passages. Of his novels, the most noteworthy, perhaps, are "Barchester Towers," "Dr. Thorne," and "The last Chronicle of Barset."

TROMP (Martin), **ADMIRAL,** *b.* 1597, *d.* 1653, a Dutch commander who very nearly gained supremacy at sea for his country. He had repeatedly worsted the Spanish fleet when fate opposed him to the English in Cromwell's time. Five times in 1652–53, he met the English, and in the last fight, against Monk, he was slain.

TROOP, the eighth part of a regiment of cavalry, consisting of a captain, two lieutenants, and fifty-six mounted men, privates and non-commissioned officers. Two troops make a squadron, and the four squadrons, with the superior officers, and the unmounted men of each troop make up a regiment of 634 men on a war footing.

TROPHY. Among ancient peoples, especially the Greeks, it was customary to erect on the scene of a victory a stone pillar decorated with the spoils of the enemy, as a memorial; this received the name "trophy" (Gr. *trope,* a turning), as a sign that there the enemy were "turned" to flight. Nowadays, trophies commemorating victories in war are frequently placed in churches and municipal halls.

TROPICS (Gr. *trope,* a turning), two circles of latitude on the terrestrial globe 23½° north and 23½° south of the Equator respectively, the northern circle being known as the Tropic of Cancer, the southern the Tropic of Capricorn. On December 21st all places on the Tropic of Capricorn receive vertical rays from the sun at noon; from that date up to June 21st following, vertical rays are received at noon by places successively farther and farther north, until the Tropic of Cancer is reached; there the sun, so to speak, *turns* (hence the derivation of the word "tropics"), and is again, on December 21st, giving vertical rays to places on the Tropic of Capricorn; the tropics thus mark the northern and southern limits of places on the earth that receive vertical rays from the sun at noon.

TROSSACHS, a mountain pass about a mile in length in the west of Perthshire, between Loch Katrine and Loch Achray. Scott's glowing descriptions of the beauty of this pass and the surrounding district in his "Lady of the Lake" have made it a famous tourist resort.

TROY, a famous city of legendary Greek history, situated in the Troad, the name in ancient times of a district occupying the extreme north-west of Asia Minor. Archæologists differ as to the exact locality of the town, but the excavations of Schliemann at the modern Hissarlik, the Ilium of Greek history, have produced strong evidence in favour of this being the long-sought site. The ten years siege of Troy in the reign of Priam, its last and greatest king, by an alliance of Greek chieftains under Agamemnon, forms the theme of Homer's Iliad. The war was entered upon by the Greeks on behalf of Menelaus, King of Sparta, whose wife, Helen, had been abducted by his guest Paris, son of Priam. The city was finally taken by a ruse suggested by Ulysses. The Greeks, as if in despair, took to their ships, leaving behind a huge wooden horse, in the body of which Greek heroes were concealed. The Trojans dragged the horse into the city, and at night the hidden men emerged and opened the city gates to their comrades, who had meanwhile returned under cover of darkness. The city was set on fire and Priam killed.

TROY-WEIGHT, a system of weights introduced in the 15th century, said to take its name from Troyes in France. It is only used by goldsmiths and jewellers, in determining the weight of coins, etc. The pound troy contains 5,760 grains, while the pound avoirdupois equals 7,000.

TRUCE OF GOD, a suspension of private feuds, observed on certain church festivals and fasts, chiefly in the 11th and 12th centuries. See *God's Truce.*

TRUCK SYSTEM, a system under which employers pay their workmen a part of their wages in goods instead of coin. In cases like the Australian gold mines, the lumber districts of Canada, etc., some such arrangement is almost unavoidable, but in England it is totally forbidden by the Truck Acts of 1831 and 1887.

TRUFFLE, a genus of fungi, certain species of which are highly valued for their edible qualities. Truffles grow beneath the soil among the roots of trees. They abound in certain parts of France, where both the hog and the dog are trained to hunt them out.

TRURO, an ancient city, and the most important in Cornwall, stands at the head of Falmouth Harbour, nine miles north of Falmouth. It is a busy little town, carrying on an important fishery. The old diocese of Truro was reconstituted in 1876 with Benson, afterwards Archbishop of Canterbury, as its first Bishop.

TRYON, SIR GEORGE, *b.* 1832, *d.* 1893, British Admiral, entered the navy at sixteen, and gradually rose in the service until in 1891, he was put in command of the Mediterranean fleet. Whilst manœuvring his ships, his flag-ship the *Victoria,* by a mistaken order of his, collided with another ship and sank with the Admiral and a great part of the crew.

TSCHAIKOVSKY, PETER ILITCH, *b.* 1840, *d.* 1893, a Russian musical composer of great power. In 1866 he was appointed professor of music at the Conservatoire of St. Petersburg, and on his retirement from that office in 1878 he devoted himself entirely to composing. He wrote several operas, but is chiefly admired for his orchestral pieces. His "Pathetic Symphony" is a work of genius.

TSETSE, a small, brownish fly found in the warmer parts of South Africa, particularly the central part of the Zambesi valley. Its bite is fatal to most domesticated animals, but harmless to wild beasts, goats, and asses. Its ravages among cattle, by minimising opportunities for legitimate trade, may be said to have encouraged the slave trade in the districts infested by this pest. It is now known to disseminate sleeping sickness among the natives.

TUDOR DYNASTY, THE, a line of sovereigns that occupied the English throne from 1485 to 1603. The first of the line, Henry VII., was the grandson of Owen Tudor, and was descended through his mother, the Lady Margaret Beaufort, from John of Gaunt. Under this dynasty, England laid the foundation of its naval supremacy, and rose to the position of the leading Protestant country of Europe.

TUDOR, OWEN, a Welsh knight, who fought at Agincourt under Henry V., and married his widow, Catherine of France. He was killed at Mortimer's Cross in 1461, fighting for the Lancastrians. His son, Edmund Tudor, married the Lady Margaret Beaufort, a union which produced Henry VII., the first of the Tudor Dynasty.

TUGELA, a river in Natal, which was three times crossed and recrossed by the British under General Buller in his attempt to relieve Ladysmith in the course of the Boer War.

TUILERIES, a royal palace of the French sovereigns in Paris, begun by

Catherine de Medici in 1564, so called from the royal pottery works (Fr. *tuile*, a tile) which had stood on its site. It suffered considerably from popular risings in 1792, 1830, and 1848, and, with the exception of two pavilions which connected it with the Louvre, was totally destroyed by the Communists in 1871.

TUMULUS, a mound of earth raised, especially by men in early times, to mark the burial-place of the dead. The arms and ornaments of the dead were frequently buried with them beneath the tumuli, and much antiquarian information has been gathered by the discovery and opening of such mounds.

TUNBRIDGE WELLS, a pleasantly situated town of Kent, on the border of Sussex. Its chalybeate waters have made it a favourite health resort since their discovery in 1606, and its popularity is increasing; population 35,000.

TUNIS, a North African State which formed part of the Ottoman Empire for the three centuries preceding 1881, in which year it was occupied by French troops and declared a French protectorate. The slopes of the Atlas Mountains and the valley of its only large river, the Mejerda, yield wheat, barley, fruits, and tobacco. Under French influence, agriculture and commerce are improving. Tunis, the capital, built largely of materials collected from the ruins of ancient Carthage, a few miles north, is now connected with the Mediterranean by a short ship-canal. Kairwan has a large caravan trade with the Soudan. Sfax is an important seaport. There is a great sponge fishery off the east coast of Tunis.

TUNNELLING, or the construction of underground passage-ways, is resorted to especially in connection with railways and canals. In railway construction, tunnelling is often adopted where surface elevations, such as hills and mountains, present a declivity too steep to be climbed by ordinary locomotives. Railway tunnels beneath rivers unsuited to bridging are frequently met with, while in many large cities, underground railways constructed in iron tubes are rendered necessary for a smooth-working passenger traffic. The Alps are now pierced by the Mont Cenis, St. Gothard, Semmering, and Simplon Tunnels, all of which are triumphs of engineering, and among the longest tunnels in the world. The Simplon Tunnel, completed in 1905, is over 12 miles long. In the case of canals such as the Leeds and Liverpool Canal, which join two towns separated by high hills, tunnels are absolutely necessary if rapidity of transit is required. Tunnelling is largely affected by the variety of strata to be worked. Tunnels in soft strata are lined with brick or stone-work, while in the case of borings through the hard rock, the tunnels are simply hollowed to the required shape. The arch, modified in different strata, so as to best resist earth-thrust, is the form in which tunnels are commonly hollowed out. The ventilation of tunnels both during and after construction is one of the great problems engineers have to contend with, and the rate of mortality from pulmonary diseases among workmen engaged in tunnelling at great altitudes is very high. The dropping of shafts at intervals along the line of a proposed tunnel, and boring from the bottom of each shaft in both directions, greatly facilitates the work, but in the case of deep-lying tunnels shaft sinking is often impossible.

TURBINE. A mechanical contrivance for driving machinery by means of water or steam escaping through small orifices, the motion of the apparatus depending on the impulse of the water, and not upon its direct weight. Turbines are much smaller than ordinary water-wheels, but revolve at a much higher rate of speed, and are conveniently used where the supply of water is insufficient, or the fall is too great for driving the ordinary wheels. In outward-flow turbines the water enters at the centre, and is directed upon curved blades at the circumference of the wheel, by a series of guide blades curved in the opposite direction, and motion is caused by the pressure of the water as it glides over the wheel-blades. In inward-flow turbines, or vortex-wheels, the currents of water pass from the circumference inwards and escape at the centre.

TURBINE ENGINES. The perfecting and applying of the principles of the turbine to the steam engine are due to the Hon. C. Parsons, whose turbine works at Wallsend cover 23 acres of ground. His turbine for marine engines consists of a cylindrical case of varying diameter, fitted with a number of rings of inwardly projecting blades. Within the case is a spindle, or shaft, upon which are mounted outwardly projecting blades, by means of which the shaft is rotated. There is an annular space between the shaft and the case. The steam enters the case from a nozzle at the forward end, meets with a fixed guide blade, is deflected on to an adjoining ring of moving blades, at such an angle as to exert a rotary impulse. It passes on to a second guide blade, which deflects it on to the second ring of moving blades, and so on, until it has been made to impinge on all the rotary blades of the spindle. The advantages claimed for turbine engines are, that they occupy less space than engines of the ordinary type, and thus give increased cargo room, and that they give increased speed. Since the rotation of the shaft of the turbine takes place in one direction only, it is necessary to provide a separate turbine and propeller for motion astern. Turbine engines are also used for driving the dynamos in the great electric power station of the London District Railway.

TURBOT, a variety of flat fish inhabiting British waters, and highly prized as a dish for the dinner-table. The finest attain a weight of 70 pounds or even more. They are caught with the line or the trawl.

TURGENIEFF, IVAN, *b.* 1818, *d.* 1883, a distinguished Russian novelist, with a European reputation. Although holding a government position, he wrote against serfdom and bureaucracy, and was banished to his estates, where he wrote his "Annals of a Sportsman," a close and fearless study of Russian peasant life. "Fathers and Sons," "Virgin Soil," and "On the Eve," are characteristic among his numerous works.

TURIN, a fine, well-built city of Piedmont, Italy, in a fertile plain on the left bank of the Po, and on the main line of railway to France through the Mont Cenis tunnel. Its history dates back to Roman times, and it was the capital of the modern kingdom of Italy for the first four years (1861-5) of its existence. Its silk, jewellery, leather, and general textile manufactures are important; population 336,000.

TURKEY, the name of a now decadent empire established by the Ottoman Turks during the 14th, 15th, and 16th centuries in South-eastern Europe, Western Asia, and North Africa. Of the vast possessions once under the immediate control of the Sultan of Turkey, all that remain are a part of the Balkan Peninsula, Asia Minor, Armenia, Kurdistan, Syria, Mesopotamia, and portions of the coastal regions of Arabia. The inefficient rule of successive sultans, official venality, a pitiful neglect of education, and absence of a real national feeling are the chief reasons for the present deplorable condition of the finance, commerce, and industries of the empire. Agricultural and pastoral pursuits occupy the bulk of the people. The exports include: (1) Fruits—raisins, currants, figs, oranges, and citrons. (2) Cereals—wheat, maize, and barley. (3) Raw materials—tobacco, cotton, silk, wool, coffee, and skins. (4) Manufactured articles—carpets, silk goods, and leather. Minerals are plentiful but little worked, means of transport are very antiquated, and railways undeveloped. Area over 1,000,000 square miles; population about 25,000,000. Chief towns—Constantinople (population about 900,000), Adrianople, and Salonica.

TURKEY, the largest of British domesticated birds, was introduced from North America, where it is still found wild, in the 16th century. The erroneous idea that the bird was a native of Turkey, gave it the name which it afterwards retained. It is distinguished by its long neck, the bright, fleshy wattles on the head and neck, and the rich hue of its feathers. The flesh is in large demand as an article of food, and enormous numbers are bred in the eastern counties of England for the Christmas markets.

TURKS, the general name for numerous and widely distributed races which include the Tartars of Siberia, the Turcomans of the Caspian basin, the Kirghiz, and the Usbecks of Russian Turkestan. For the most important branch, see *Ottomans*.

TURNER, JOSEPH W. MALLORD, *b.* in London, 1775, *d.* 1851, a famous British painter. He was the son of a hair-dresser. For a short time he studied under Sir Joshua Reynolds. In 1802 he was elected a Royal Academician and began his continental wanderings by which he gathered materials for his numerous oil-paintings. Previous to 1802 he had gained fame by inimitable studies in water-colours. His works display great imagination and originality, and as a colourist he stands in the highest rank among modern painters. Ruskin's unstinted praise of Turner helped largely to secure recognition of his great merit. His pictures and sketches which he left to the nation occupy two rooms in the National Gallery. "Childe Harold's Pilgrimage," "The Fighting Temeraire," "Ulysses Deriding Polyphemus," "Dido building Carthage," and "Calais Pier" are among the most admired of his paintings.

TURPENTINE, a colourless, oily liquid, obtained by the distillation of the resins of various species of pine and fir. It is a solvent for resins and rubbers, and is used in varnish manufacture. Large quantities are imported into Britain from Russia. The name "turpentine" is also employed for the crude resinous oil obtained direct from pine and fir trees.

TURPIN, DICK, a daring highwayman, who was captured and hanged at York in 1739, at the age of thirty or thereabouts. Many romantic legends were written around his name by the ballad-writers of the period, but the tale of the famous ride from London to York on the mare, "Black Bess," in sixteen hours, was borrowed from the deeds of a less famous rogue.

TURTLE. See *Tortoise*.

TUSCANY, one of the provinces of Italy, lies between the Apennines and the Tyrrhenian Sea. Wheat, maize, the vine, olives, and fruit are successfully grown. The silk industry and straw-plaiting employ large numbers of the people. Pisa and Florence are the chief inland towns, and Leghorn the principal port.

TUSSAUD, MADAME, *b.* 1760, *d.* 1850, a Swiss lady who learnt modelling in wax at Paris, fled to England at the time of the Revolution, and, in 1802, exhibited

at a small building in Marylebone Road, London, a number of models, which have since grown into a world-famous collection.

TWAIN, MARK. See *Clemens*.

TWEED, a river of Scotland, part of whose lower course forms the boundary between England and Scotland. It rises in the Lowther Hills, and enters the North Sea at Berwick, after a course of 97 miles. It figures largely in the tales of Border raids, and many of the scenes in Scott's novels are laid in its vicinity.

TWELFTH-DAY, the twelfth day after Christmas. On this day, the festival of the Epiphany is held in honour of the three Magi, or wise men from the east, who visited Christ at Bethlehem. Twelfth-night is still celebrated in some countries with much joviality, being regarded as the conclusion of the Christmas festivities.

TYBURN, a turnpike, which once stood near the present Marble Arch, London. Previous to 1783 it was the scene of the public executions of Metropolitan criminals sentenced to death. The name is derived from that of a small brook or burn, the Tyburn, which once flowed by the place towards the Thames.

TYCHO BRAHÉ. See *Brahé, Tycho*.

TYLER, WAT, the leader of the men of Kent in the Peasants' Revolt of 1381. With his followers he marched on London, and destroyed the houses of the leading opponents to reform. On receiving from the government promises of immediate redress of grievances, the bulk of the insurgents, who throughout had acted with great moderation, dispersed to their homes. Tyler, who remained behind, with the most determined of his followers, was stabbed to death at Smithfield by William Walworth, mayor of London, during an interview with the king, in which Tyler's attitude had been very threatening and insolent.

TYNDALE, WILLIAM, *b.* in Gloucestershire, 1484, *d.* 1536, an English reformer and translator. He studied at Oxford and Cambridge, and was ordained a priest in 1521. His warm support of religious reform led to his flight from England in 1524, to avoid persecution. In Germany, he translated and had printed the New Testament and the Pentateuch. He was arrested by order of the Emperor, Charles V., with the connivance of Henry VIII., and tried for heresy. He was first strangled and his body afterwards burned at the stake in the Netherlands.

TYNDALL, JOHN, *b.* in Carlow, Ireland, 1820, *d.* 1893, a famous physicist. He was the son of a small tradesman, and after working for some years on the Ordnance Survey he spent three years studying science in Germany, at Marburg University and at Berlin. He was elected Fellow of the Royal Society in 1852, and was professor of physics at the Royal Institution, London, from 1853 to 1887. He was a most successful lecturer, his illustrations and language being remarkable for their lucidity. He made important discoveries in physics. "Heat, a Mode of Motion," "Fragments of Science" and "Mountaineering" are his best-known works.

TYNE, THE, a river in the north of England, the lower part of whose course separates Northumberland from Durham. Its length is about 70 miles. Its basin contains an important coal-field, and it has developed into one of the busiest of English rivers. By constant dredging, the river is rendered navigable for the largest steamers from the sea to Newcastle. The lower course of the Tyne is studded with towns engaged in ship-building, and in glass and chemical manufactures. Joined to Newcastle by three bridges is Gateshead; population 120,000. Near the mouth of the river is S. Shields (population over 110,000) the birthplace of the lifeboat; and on the opposite side is N. Shields, which forms part of the borough of Tynemouth (population over 50,000). Three miles above S. Shields is the rising ship-building town of Yarrow, the home of the "Venerable Bede."

TYPE, in printing, a small piece of metal or other suitable substance, having on one of its sides a raised letter or symbol in reverse. Types are classified into *bodies*, according to the size of the characters produced by them in printing. A proportionate quantity of each of the letters of the alphabet, with figures and other characters, in any one body form a *fount* or *font*. There are about 230 separate characters in a fount and a proportionate number of each character. The bodies in most general use for ordinary book-printing are, in descending order of size, as follows:—(1) English. (2) Pica. (3) Small Pica. (4) Long Primer. (5) Bourgeois. (6) Brevier. (7) Minion. (8) Nonpareil. (9) Ruby. (10) Pearl. (11) Diamond. The type here used is nonpareil.

TYPE-WRITING, the name given to a species of printing on paper, produced by a machine specially contrived for that purpose and known as a type-writer. The machine is fitted with a key-board, each key of which is marked with one of the letters, figures, points, or abbreviations required in business correspondence or other matter. Pressure on a key brings into play the corresponding type within the machine. Each type moves automatically for printing to the same point above the paper, which meanwhile moves automatically into position to receive successive impressions. In most machines the impression is made by the type striking an ink-saturated ribbon and pressing it against the paper. A few machines print directly, the type when not in use resting on an ink-pad. In a full keyboard, one key to each type, the number of keys is about 65, but this number is reduced in many cases to below 30 by an arrangement which allows the same key to print a capital letter, a small letter, or a figure, at the will of the operator. In business houses and amongst literary men, this invention is of great utility, and in the hands of a capable worker, greater rapidity and legibility are secured than by ordinary hand-writing. The Remington, Yost, Barlock, Smith Premier, Hammond, Empire, and Oliver are the best known machines.

TYPHOON, the name commonly given in the Chinese Seas to those storms elsewhere called hurricanes and tornadoes. The storm advances in a parabolic direction, and at the same time the wind within the storm area rotates with frightful energy, so that in the same storm the direction of the wind will be north at one place and south at another place 300 miles or so away.

TYRE, one of the most famous cities of antiquity, is situated partly on the mainland and partly on a small peninsula off the coast of Syria. It was the great port of Phœnicia from the 10th century B.C., to its capture in 332 B.C. by Alexander the Great, who succeeded in taking it after a long siege by constructing a mole from the mainland to the island on which the city then stood. Accumulations of sand and mud have since converted this causeway into a broad isthmus. Tyre continued to be an important trading centre for many centuries, till its capture by the Turks in the 14th century reduced it to its present degraded condition. It was long famous for a dye, "Tyrian purple," obtained from a shell-fish.

TYROL, with Vorarlberg, a province of Western Austria, which is extremely mountainous, being intersected by three distinct chains of the Alps. The valleys of the Inn and the Adige, its principal rivers, yield most of its agricultural products, which include cereals, the vine, tobacco, silk, hemp, and flax. Large numbers of canaries are bred for export. Timber—beech and fir—is plentiful, and lead, iron, coal, and rock-salt are worked. Pastoral pursuits occupy large numbers of the population. Tyrol has formed part of Austria since 1363. Its brilliant resistance to Napoleon in 1809 under the patriot, Andreas Hofer, forms one of the most interesting episodes of the Napoleonic Wars. Area about 11,000 square miles; population 982,000.

UGANDA, a territory in Africa between the Congo Free State and British East Africa, containing the northern half of Victoria Nyanza. Its height above sea-level renders the climate suitable to Europeans, and its soil is remarkably fertile, being particularly adapted to the growth of cotton and coffee. The natives are peaceable and comparatively intelligent. Agriculture is at present confined to the cultivation of wheat, maize, millet, and bananas. Trade in ivory and rubber is considerable. The Uganda Railway, from Victoria Nyanza to Mombasa, the port of British East Africa, has given a strong impetus to trade, and will hasten inland development. Area about 86,000 square miles; population about 4,000,000.

UHLANS, a kind of light cavalry in the Austrian, Russian, and German armies. The Uhlans of the Prussian army gained great fame for their part in the Franco-German War of 1870-1.

UJIJI, a town on the eastern shore of Lake Tanganyika in "Central Africa." It is an important trading station on the caravan route from Zanzibar inland, and is the home of numbers of Arab traders. Here, Stanley found Livingstone in 1871.

UKASE, the name given in Russia to an edict or order issued by the Czar, or, in his name, by the Senate. It has all the force of law.

ULEMA, the name given in a Mohammedan country to the whole body of professional theologians, whose duty it is to interpret the Koran and the law derived therefrom.

ULM, a strongly-fortified city of Wurtemburg, Germany, on the Danube, at the point where that river becomes navigable. It has a fine 11th century cathedral, and manufactures woollen and linen goods, machinery, leather, and ornamental pipe-bowls. Here, in 1805, General Mack, with 28,000 Austrians, capitulated to Marshal Ney; population 43,000.

ULSTER, the most flourishing of the four provinces of Ireland, occupies the northern portion of the country, and consists of nine counties. Continual insurrections in the reign of Elizabeth and the early part of James I.'s reign, led to its appropriation by the Crown and its allotment in 1607 to Scotch and English settlers, to which circumstance must be attributed its subsequent prosperity. The linen trade of Ulster is very important, and the ship-building industry at Belfast is highly developed. Area about 8,600 square miles; population about 1,600,000.

ULTRAMONTANE PARTY, that party in the Roman Catholic Church that holds extreme views in favour of the Papal authority both in Church and State. The name originated with the Gallican

Church of France, and was applied to the bulk of Italian theologians "beyond the mountains," i.e. the Alps.

ULYSSES. See *Odysseus.*

UMBRELLA. As a screen against the sun, it was used in the East in very remote times, and figures prominently in Assyrian and Egyptian sculpture, where it appears to be one of the insignia of royalty. As a protection against rain, the umbrella was first used in England—by women only—in Anne's reign. Joseph Hanway, of London, appears to be the first Englishman to brave ridicule by its adoption in 1750, and his example was very tardily followed. Ribs of steel superseded whalebone in the manufacture of frames about 1850.

UNCIAL LETTERS, alphabetical letters of a large size, originally as high as one inch (Lat. *uncia*, inch), employed by writers from the 5th to the 9th century in copying Latin and Greek manuscripts. Original Latin and Greek manuscripts were written entirely in large square capitals, and uncial letters being a compound of capitals and curved small letters, mark a step in the development of written language.

UNCLE SAM, a familiar name for the United States Government, derived from a humorous interpretation of the abbreviation U. S. (United States).

UNCLE TOM'S CABIN, a pathetic tale dealing with the slave question in the United States, written by Mrs. Harriet Beecher Stowe, and published in book form in 1852. It created a deep sensation in all English-speaking countries, and did much to strengthen public opinion in the Northern States against slavery.

UNCTION, the anointing of the body, or an inanimate object, with oil. The practice is of extreme antiquity, and the anointing of sacred pillars of stone was often resorted to by pagan worshippers of primitive times. Among the Hebrews, priests were anointed at their consecration, and later, at the election of Hebrew kings, anointing the head of the ruler chosen was an important rite. Unction is still performed in many ceremonies of the Roman Catholic Church. Extreme unction, the anointing of the eyes, nose, ears, mouth, hands, and feet, is performed by a bishop or priest on persons at the point of death, and symbolises purification from sins committed by the parts anointed.

UNDINES, female water-spirits, whose existence was believed in by the eccentric Swiss alchemist, Paracelsus (1493-1541), according to whom undines were allowed to marry with mortals, and on the birth of a child received human souls. The husband of an undine had to exercise extreme care when travelling on water with his wife, as, if irritated, she lost her human soul and returned to her original element. La Motte Fouqué's "Undine" is founded on this myth.

UNDULATORY THEORY, the name given to one of the theories elaborated to explain the phenomenon of light. According to this theory, a wave motion is set up in the all pervading ether by molecular motion in the source of light. The effect of the successive waves of ether on the retina produces the sensation of light.

UNICORN, a fabulous, one-horned animal, with the body of a horse, whose existence at any period in the past has never been verified. The Hebrew *reëm*, an animal whose name has been rendered in the Authorised Version of the Bible as "unicorn," has long been believed to have been a double-horned species of wild ox. For many years, two unicorns salient figured in the royal arms of Scotland, and on the accession of James I. in 1603, one of these replaced the Welsh dragon in the arms of England.

UNIFORMITY, ACT OF, an act passed by the English parliament in 1662, compelling all ministers to be of episcopal ordination, to use the Book of Common Prayer, and to publicly declare their assent to all its contents, to renounce the Solemn League and Covenant, and to take the oath of non-resistance to royal authority. By this act, about 2,000 ministers who refused to conform to its demands were removed from their livings. Acts of Uniformity had also been passed in the reign of Elizabeth.

UNION, ACT OF, an act passed in 1800, which secured the legislative union of Great Britain and Ireland. By it the Irish parliament was abolished, and Ireland empowered to send to the parliament of the United Kingdom, sitting at Westminster, 4 bishops, 28 lords-temporal, and 100 commoners. In matters of trade Ireland was put on the same footing as England.

UNION OF ENGLAND AND SCOTLAND. From the accession of James I., attempts had been made to make the two kingdoms one, but the jealousy of the Scottish nobles, who feared to lose their importance, had rendered them nugatory. In 1707, after much negotiation, the two parliaments ratified an agreement by which the two kingdoms were to be one as regards trade and taxation, while Scotland was to retain her old laws and her Presbyterian form of religion, and to send 16 members to the Upper, and 45 to the Lower House of Parliament, meeting in London.

UNIONISTS, the name common to the Conservatives and that branch of the Liberal party which seceded in 1886, with the resolve to uphold at all costs the Union of 1800.

UNION JACK THE, the name given to the national flag of the United Kingdom. An examination of this flag shows the red cross of St. George of England uppermost. Below is the red diagonal cross of St. Patrick of Ireland, covering, with the exception of the outer edges, the white diagonal cross of St. Andrew of Scotland. The Scottish national flag was worked into the design of the cross of St. George at the union with Scotland in 1707, the Irish emblem being added in 1800. The term "jack" arises from the flag being once attached to a 'jack-staff" fixed at the bow of a vessel.

UNITARIANS, a religious body which rejects the doctrine of the Trinity, because they consider that it destroys the unity of God, but they vary widely in their estimate of our Lord's person—some acknowledging Him as divine, others regarding Him merely as man, although endowed in an extraordinary degree with spiritual gifts. They first appeared as a distinct denomination in 1719, but as early as the 4th century their views found an exponent in the celebrated Arius. Refer to "Unitarians" in *Index.*

UNITED STATES OF AMERICA, THE, a great and flourishing republic, occupying over three million square miles of the central portion of North America, and stretching from the Atlantic to the Pacific Ocean. It consists of forty-five states, four territories, one district (Columbia), and the detached territory of Alaska. Vast stretches of fertile soil, a wide range of climate, abundant water-ways both natural and artificial, an elaborate railway system embracing nearly 200,000 miles of track, almost illimitable natural resources, magnificent harbours, and an energetic and ambitious people, have all been factors in the gigantic strides made by this comparatively young nation. Almost every branch of industry is represented there on the grandest scale. The great depression between the Alleghanies and the Rocky Mountains is one of the leading agricultural districts in the world, wheat, maize, and cotton being produced there in amazing quantities. Virginia, Maryland, and Kentucky produce more than half the world's supply of tobacco. Pigs are reared in enormous numbers, and pork-packing is one of the great industries of Chicago. Fruit is grown on a large scale in the Atlantic States and in California. The great prairie lands west of the Mississippi support over 40 million cattle. Minerals, with the exception of tin, exist in abundance. Pittsburg, on the great Pennsylvanian coal-field, bids fair to become the greatest iron and steel-manufacturing town in the world. Precious metals abound in the mountainous states of the western region, and the yield of the oil-fields of Pennsylvania and Texas is very large. For the year ending June, 1904, the imports and exports reached a total of nearly 2,500 million dollars, the exports being 470 million dollars in advance of the imports. The exports to the United Kingdom—its best customer—amounted to 524 million dollars, of which total, cereals, flour, cotton, bacon, and hams claimed 190 million dollars. *History.* The principal landmarks in the history of this nation since the acknowledgment of its independence by England in 1783 are as follows. In 1803, Louisiana and its dependencies were purchased from France and added to the Union, a national event whose centenary was recently celebrated by the St. Louis Exhibition. The annexation of Texas in 1845 resulted in war with Mexico, and the further addition of New Mexico and Upper California. The great Civil War of 1861-5 on the question of negro slavery, ended in favour of the Northern States, the opponents of slavery, and eventually greatly consolidated the union among the States. In 1898 a successful war against Spain freed Cuba from the domination of the Spaniards, and left the United States in possession of Porto Rico and the Philippine Islands. Population by the census of 1900 was 76,356,000.

UNREASON, ABBOT OF, or Lord of Misrule, the person chosen to lead the fooling common at Christmas time in the Middle Ages. Even the churches were not sacred from their jests, but they would lead their followers in and go through a mock service, dressed in the priest's robes, or with the aid of an ass rehearse the journey of Balaam, the Flight into Egypt, or the Triumphal entry into Jerusalem.

UNTER DEN LINDEN, i.e. "under the lime trees," the name of a broad avenue in Berlin leading from the Brandenburg Gate to the royal palace. It is a much frequented thoroughfare, and contains four rows of splendid lime trees.

UNYORO, a fertile and healthy district of Equatorial Africa, between Uganda and Albert Nyanza. Since 1896 it has formed part of the British Protectorate of Uganda.

UPAS, the name given to various species of trees found in Java and other islands of the Eastern Archipelago. From them, either by incision or naturally, oozes a poisonous gum, used formerly by the natives for tipping their arrows. The tales of the deadly effect of this tree on plants and animals in its vicinity are largely fictitious.

URAL MOUNTAINS, a chain of hills and plateaus extending for about 1,500 miles from the Arctic Ocean to the Kirghiz Steppes, and forming part of the boundary separating Europe from Asia. The highest peak, Tollpos-Iz, is 5,550 feet

high. Gold, platinum, copper, iron, and precious stones are plentiful, and the mining industry, of which Ekaterinburg is the centre, is well developed. A small coal-field near Perm has greatly assisted mining in the Urals.

URANIUM. See *Pitch-blende.*

URANUS, in Greek mythology, son of Ge (Earth), and by her the father of the Titans. Kronos (Saturn), the youngest of the Titans, waylaid and mutilated his father, released his brothers and sisters imprisoned in Tartarus by Uranus, and reigned supreme till overthrown by his own son, Zeus (Jupiter). The name is also given to one of the planets of the Solar System, seventh in order from the sun, discovered by Sir William Herschel in 1781.

URSA MAJOR (Greater Bear), a constellation in the northern hemisphere, so called from the fact that the ancients saw in the stars composing it a resemblance to the outlines of a bear. It contains about eighteen stars visible to the naked eye, and the seven brightest form what is known as "The Plough" or "Charles's Wain." The two stars forming the fore part of the "Plough" are called the pointers, since the straight line joining them "points" towards the Pole Star.

URSA MINOR (Lesser Bear), a small constellation of which the brightest star, a star of the third magnitude, is the nearest bright star to the celestial pole, and is hence called the "Pole Star." The Greeks named this group Cynosura, from its resemblance to a dog's tail.

URSULA, SAINT, a virgin martyr, put to death—according to an old and much-disputed legend—by the Huns in the 4th or 5th century. A maiden companion, Undecimilla, suffered with her, and a misinterpretation of the name has probably led to the incredible story that 11,000 (Lat. *undecim millia*) virgin companions died with Ursula.

URUGUAY, a South American republic on the Atlantic coast between Brazil and the Rio de la Plata. Most of the country consists of rolling grass plains backed by high lands in the interior. The cultivation of wheat, maize, tobacco, and fruit is rapidly increasing, but at present the bulk of the exports is derived from the cattle and sheep-rearing industries. The firm of Liebig has its station at Fray Bentos, and is the largest ranch owner of the Republic. Dishonesty and corruption are rampant among state-officials, and is the chief cause of the backward condition of the country. Montevideo is the capital and chief port. Paysandu, on the La Plata, is an important meat-preserving centre. Area about 72,000 square miles; population 950,000.

USSHER, JAMES, *b.* 1581, *d.* 1656. Archbishop of Armagh and Primate of Ireland, one of the most learned men the church has produced. His chronology, accepted at the time as infallible, is now rejected, but his other works show how vast was his learning. He was buried by Cromwell's orders, though a Royalist, in Westminster Abbey.

USURY, originally meant the interest paid by a borrower for the loan of money; it is now applied to excessive and unfair interest on money lent. By the Money Lenders Act of 1900, borrowers are protected against fraud, and money-lenders suing for non-payment of debt are liable to have unfair contracts annulled and a readjustment made by the presiding judge.

UTAH, one of the Western United States of America, forms part of the elevated plateau between the Rocky Mountains and the Sierra Nevada. The Wahsatch Mountains, which are rich in gold, silver, and other minerals, run through it from north to south. Much of the country is arid, but the energy of the Mormons, who first settled there in 1847, has converted it into a fairly prosperous farming state. Its inclusion into the Union in 1896 has led to strong measures being taken against the Mormon practice of polygamy, and has also encouraged an influx of miners. Salt Lake City is a well-built and flourishing city.

UTILITARIANISM, that theory of Ethics which maintains that the individual's sense of right and wrong is the outcome (unconscious it may be) of mankind's experience as to the result of a certain line of conduct. The utilitarian, or upholder of this theory, regards utility as of primary importance, giving but a subordinate place to considerations of beauty and sentiment, in determining the right course of action.

UTOPIA, the title of a work of imagination published by Sir Thomas More in 1516. *Utopia* signifies "Nowhere," and is the name that he gives to an imaginary island, the inhabitants of which he describes as having reached a high pitch of perfection in politics, government, and social institutions. The adjective "Utopian" has come to mean, somewhat unfairly, visionary and practically unattainable.

UTRECHT, an important railway and canal centre of Holland, near its eastern boundary. It is strongly fortified, has a good university, and besides an extensive trade in grain, cattle, and dairy-produce it manufactures general woollen goods, linen goods, and tobacco on an extensive scale. Here, in 1713, was signed a treaty between France and England which closed the War of the Spanish Succession: population 108,000.

VACUUM, a space devoid of matter. According to physicists, an absolute vacuum is impossible, the mysterious medium, ether, whose existence has been invented to explain certain phenomena, always being present. The nearest approach to a vacuum produced by mechanical means is the Torricellian Vacuum in a barometer tube, but even this contains a little mercury vapour.

VALENTINE AND ORSON, twin brothers in a famous romance of the time of Charlemagne, first printed in 1489.

VALENTINE'S DAY, the 14th of February, a day dedicated to Saint Valentine, who is reported to have suffered martyrdom in the 4th century A.D. The practice of young couples exchanging love missives on this day was once very common, and has been attributed to a belief once current that on this day birds began pairing.

VALETTA, the port of Malta and the home of the great bulk of the population of that island, stands on rather broken ground between two good harbours. As the seat of a British Government dockyard, and the head-quarters of the English Mediterranean Fleet, it has been very strongly fortified. It is a port of call for several steam-ship lines, and is also an important coaling-station. The increasing demands on its resources have necessitated great extensions of the dockyard and harbour at Gibraltar.

VALHALLA, in the mythology of Scandinavia, was the abode of Odin and the gods, and the final resting-place of the souls of heroes slain in battle. Here, during the day, the heroes enjoyed to the full their lust of fighting, and spent the night feasting and drinking with Odin as host and the valkyrs as attendants.

VALKYRS, beautiful maidens in the Norse mythology who presided over battles, marked out those destined to fall, and conducted their souls to Valhalla.

VALLOMBROSA ("shady valley") a beautiful valley among the Apennine Mountains, 15 miles east of Florence. The magnificent Benedictine monastery, founded here in 1038, and rebuilt in 1673, is now suppressed. Vallombrosa is a favourite resort of artists and tourists.

VALPARAISO, the chief port of Chile, stands on a safe and spacious bay, and is connected by rail with Santiago, 90 miles inland. The bulk of Chilian trade passes through it, and considerable quantities of wheat, barley, fruit, copper, guano, and nitrate of soda are exported; completely wrecked by a terrible earthquake, 1906.

VAMPIRE. (1) A ghost possessing a human body, which at night sucks the blood of the living. According to this superstition, which was once very widespread but is now confined to the most ignorant of the Slav races, wizards, witches, suicides, and excommunicated persons became vampires after death. (2) A species of blood-sucking bat.

VANBRUGH, SIR JOHN, *b.* 1664, *d.* 1726, architect and dramatist. He early found success both in play-writing and in building. This latter work will, however, better bear inspection than his plays for these, clever, witty, and original, are full of indecency. The grandeur of Blenheim House witnesses to his genius as an architect.

VANCOUVER, a rapidly developing port of British Columbia, opposite Vancouver Island, is the western terminus of the Canadian Pacific Railway. It has a deep and commodious harbour on Burrard Inlet, abundance of timber, metals, and food-stuffs exist in the vicinity, and altogether it has a most promising future; population rapidly increasing.

VANCOUVER, GEORGE, *b.* 1758, *d.* 1798, a British navigator who served as midshipman under Captain Cook in his last two voyages to the Pacific. He afterwards supplemented the work of that great sailor by exploring, in 1791-5, various islands of the Pacific. In 1792 he surveyed the shores of what is now British Columbia. Vancouver Island is named after him.

VANCOUVER ISLAND, a large island off British Columbia. It is rich in gold, mercury, and coal. At present, coal, salmon, and skins are the chief exports, but the agricultural and pastoral prospects of the island are bright. The chief towns are Victoria, the capital of British Columbia, Nanaimo, a coal-mining centre, and Esquimault, a naval port on a magnificent harbour. Area nearly 16,000 miles; population exceeds 40,000.

VANDALS, a Teutonic race which played a prominent part in the disruption of the Roman Empire in the 5th century. They over-ran Gaul and Spain, and crossing to Africa established there, in 429, under Genseric, their chief, a kingdom which lasted till 534. The wanton destruction of artistic and literary monuments during the sack of Rome by Genseric in 455 has given rise to the term "vandalism."

VANDERBILT, CORNELIUS, *b.* 1794, *d.* 1877, an American financier, who began his career as a boatman and died worth 100 million dollars. For many years he held controlling interests in the shipping and railroads of the United States. The Vanderbilt University of Nashville, Tennessee, was founded by him with a gift of a million dollars.

VAN DIEMEN'S LAND, the name given by Tasman, discoverer of Tasmania, to the island which afterwards received his own name. Van Diemen was the Dutch

Governor of Java at the time of Tasman's discovery (1648).

VANDYKE, ANTHONY, *b.* at Antwerp, 1599, *d.* in London, 1641, a Flemish painter who excelled especially in portraits. He studied under Rubens for four years, and from 1632 to his death made England his home. He became Court painter to Charles I., and his paintings of the king, the members of the royal family, and the leading men of the time are not only interesting historically, but are ranked among the finest examples of portraiture.

VANE, SIR HENRY, *b.* 1612, *d.* 1662, one of the most active and able members of the Parliamentary party, was educated at Westminster and Oxford. He then spent much time abroad, imbibing the rigid views of the extreme Puritans. He took a leading part in Laud's impeachment, and in promoting the "Solemn League and Covenant." He was executed on a charge of high treason, 1662.

VAN EYCK. See *Eyck, Van.*

VANILLA, a genus of climbing orchid native to Mexico, where it is chiefly cultivated. It is grown very successfully in many islands of the Indian Ocean, especially Mauritius. The fruit, in the form of a pod, yields an aromatic fluid—also called vanilla—used in flavouring chocolate and confectionery.

VARNISH. (1) *Spirit-varnish* is made by dissolving resin or a resinous substance in a volatile liquid such as alcohol or turpentine. When dry it leaves a hard coat of resin. (2) *Oil-varnish* is obtained by the use of linseed oil and turpentine in place of the spirit. It forms a tough varnish useful for indoor purposes on woodwork. The best and hardest resin, known as copal, is obtained in Zanzibar.

VASCO DA GAMA. See *Gama, Vasco da.*

VASELINE, a copyright name applied originally by one firm to a substance now commonly known by this name. It is a yellow, translucent product of petroleum, much used as a lubricant, salve, and medicine. Of the consistency of grease, it is preferable to animal fats, because it does not become rancid.

VASHTI, the disobedient queen of King Ahasuerus, who was divorced lest her example should lead the wives of the nobles to be refractory. See *Book of Esther*, chap. i. Her successor in the royal favour was Queen Esther.

VATICAN COUNCIL, THE, was the great council which met in 1869, and proclaimed the Infallibility of the Pope. The Church of Rome regards it as the 20th Œcumenical Council, or Council representing the whole Christian Church. The Greek Church recognises only the first seven councils as œcumenical, and the English Church hardly so many.

VATICAN PALACE, THE, the residence of the Popes in Rome, and the official head-quarters of the Roman Catholic Church. It occupies a large part of the Vatican Hill to the north of St. Peter's, and is made up of a mass of imposing buildings. Its chapels, libraries, and museums contain priceless treasures of art and learning. Since the nationalisation of Italy, and the occupation of Rome by the civil power, the Popes have elected to remain virtual prisoners in their own palace.

VAUBAN, SEBASTIAN, *b.* 1633, *d.* 1707, Marshal of the French army. He was a brilliant engineer, and found scope for his ability in the campaigns of Louis XIV. against the cities of the Netherlands. He conducted fifty successful sieges, and surrounded France with a wonderful cordon of fortifications.

VAUDEVILLE, originally a topical, humorous song, afterwards came to denote a light play interspersed with such songs and enlivened with dances. *Val de Vire*, a Normandy vale, gave its name to this type of song and play, for it produced Basselin, a writer of the drinking-songs which first bore the name.

VAUDOIS. See *Waldenses.*

VEDA, THE. Refer to *Index.*

VEDETTE, a mounted sentinel stationed at a prominent outpost to observe the enemy, and report information.

VEGETARIANISM, the practice of abstaining from animal food, and living entirely on products of the vegetable kingdom. Its adherents maintain that all the nutritive properties of flesh are to be found in a higher degree in vegetarian dietaries, whilst the need of butchering animals is obviated, and an obstacle to man's higher development is removed. The use of eggs and milk by some sects of the cult led to their designation as "vems," a word formed from the initial letters of vegetables, eggs, and milk.

VEHMGERICHTE, or **VEHME,** a powerful tribunal of mediæval Germany. The court was thoroughly representative of the most powerful interests, and its acts were usually just and well weighed. Its methods were quaint. The accused was summoned by a notice fastened on his door, and, if found guilty, hanged on the nearest tree. The court was powerful in Westphalia, where it lasted with diminishing influence until its last offices were abolished in 1811.

VEILED PROPHET OF KHORASSAN. *Al-Mokanna*, "The Veiled," the subject of one of Thomas Moore's beautiful Eastern poems, gave himself out to be the incarnation of God, and gained many adherents. But the Caliph's forces proved too strong for him, and he took poison to avoid capture, 780 A.D.

VELASQUEZ, DIEGO, *b.* at Seville, 1599, *d.* 1660, a self-taught painter, who began by painting still life, and became one of the great masters of portrait and subject painting. As court painter to Philip IV. of Spain, he depicted the king on many canvases. His excellence of style may be judged from his masterpiece, "Admiral Pareja" and his celebrated "Venus," in the National Gallery.

VELVET is a fabric of silk with a thick pile formed by weaving in additional warp threads, which are passed over wires and afterwards cut. True velvet is all silk, but cotton-backed velvet is much made. Velveteen, an all-cotton fabric, is a cheap substitute for velvet. The mediæval velvets of Italy are in great request both for altar frontals or ceremonial vestments, and for private collections.

VENDÉE LA, a province of France, on the Bay of Biscay, where the Royalist peasantry rose in revolt against the excesses of the Revolution of 1793, and particularly against the execution of Louis XVI. General Kleber was sent to put down the revolt, but being too lenient was recalled and General Hoche finished the war. Many prisoners were publicly drowned in barges in the Loire.

VENDETTA, a system of private revenge for bloodshed, formerly much in vogue in Corsica, Sicily, and Southern Italy. The family of a murdered man made it a point of honour to avenge the wrong openly or by stealth, upon the members of the murderer's kindred. Such feuds often lasted for many generations. Dumas' "Corsican Brothers" shows vividly the last stages of a vendetta.

VENEER, the name given to thin facings of valuable or fine-grained woods, such as mahogany or rosewood, which are glued to commoner timber. Veneers rarely exceed $\frac{1}{8}$th of an inch in thickness; they are cut by saw, and are fixed under screw-pressure, face downwards, on a heated table, which hastens the fixing of the glue.

VENEZUELA, THE REPUBLIC OF, is a confederation of fifteen States in the north of South America, bordering upon the British colony of Guiana, with a population of $2\frac{1}{2}$ millions. The people are Roman Catholics, education is free, and there are two universities. Caracas, the capital, has 80,000 inhabitants.

VENICE, once the richest republic of the Mediterranean, is built on piles on numerous mud-banks and islets in a lagoon on the north-west of the Adriatic. The Grand Canal, spanned by the famous Rialto, is two miles long, and there are countless by-ways of water, on which ply numerous gondolas. The Piazza of St. Mark, a magnificent square, surrounded by the cathedral, the Doge's Palace, and other public buildings of great beauty, contains also the famous lion columns. The exquisite mediæval campanile which stood in the square, collapsed in 1902 and is in course of re-construction. Ruskin's "Stones of Venice" has familiarised many with the beauty of the Doge's Palace. The city is still famous for its glass making and its fine fabrics, but it is far from being the centre of that life which produced in one generation a Titian, a Tintoretto, and a Veronese.

VENTILATION. Refer to *Index.*

VENTRILOQUISM, literally, speaking in the stomach, is the art of speaking so that the voice seems to come from a point distant from the speaker. The lips are not moved, a full breath is taken and retained under effort, the voice is skilfully assimilated to imitate required sounds, and above all, the attention of the audience is directed to the point from which the sound is supposed to issue.

VENUE, the place or district where a cause of trial arises, and formerly where it must be tried. "There is, however, now no 'local venue' for the trial of any action" (Stephen's Commentaries). And if on account of prejudice a fair trial cannot be expected locally, the High Court may change the *venue* or place of trial.

VENUS. (1) the Roman goddess of love, identified with the Greek Aphrodite. As the ideal of womanly grace and beauty she was the subject of many famous statues in ancient Greece and Rome. Of those now extant, the most famous are the Venus de Medici at Florence, and the Venus of Milo in the Louvre at Paris. The latter is probably the most admired of all ancient statues now existing (see *Aphrodite*). (2) The most brilliant of the planets. Its orbit lies between that of the Earth and Mercury. It completes its revolution round the sun in 225 days. The transit of Venus across the sun's disc has enabled astronomers to calculate more accurately than in any other way the distance of the earth from the sun.

VERA CRUZ, the chief port of Mexico, has a good roadstead, but no harbour, and is unhealthy. The town was founded by Cortes in 1520; population 25,000.

VERDI, GIUSEPPE, *b.* 1813, *d.* 1901, the last of the great Italian composers of opera. "Rigoletto," "Il Trovatore," and "La Traviata" represent his best work and the best of Italian opera. Verdi rose by hard work from the obscurity of a small organist to be the recognised leader of music in Italy.

VERDIGRIS is the green product that forms on copper which has been affected by vinegar or other acid. From it is made the green paint so much used in Holland as a preservative of wood. Its

formation on copper vessels necessitates great cleanliness in culinary work, as verdigris is a dangerous poison.

VERDUN, a town and fortress on the north-east frontier of France, on the river Meuse. It was held by the Germans in 1871 till the last franc of the war indemnity was paid by France. Since Metz was lost, it has become of the highest importance as a strategic point, and is correspondingly well fortified. Its importance dates back to the early Middle Ages; population 21,000.

VERGIL, or **VIRGIL,** *b.* at Mantua, 70 B.C., *d.* 19 B.C., the greatest of Latin poets. Virgil was one of the poets "patronised" by Mæcenas, the "prime-minister" of Augustus, and his works were famous in his own day. The "Eclogues" are ten pastoral poems, the "Georgics" extols the art of farming, and the "Æneid" is a grand epic poem recounting the adventures of Æneas, after the fall of Troy.

VERJUICE, an acid liquid or vinegar, expressed from sour grapes, crab-apples, and other fruits, and formerly used for cooking purposes.

VERMICELLI. See *Macaroni.*

VERMILION, a colour formerly obtained from the cochineal insect. The name is more commonly applied now to a pigment composed of sulphide of mercury, artificially made by heating sulphur, mercury, and potash together as a paste. The colour is also obtained as one of the coal-tar dyes, but it lacks permanency in this form if exposed to sun-light.

VERMIN, harmful or troublesome wild animals, such as weasels and hawks, which are hurtful to game; pests, such as mice, rats, fleas, bugs, and lice; and other animals such as foxes, badgers, and otters, which, though classed as vermin, are treated with respect as providing good sport.

VERMOUTH, a cordial consisting of white wine flavoured with wormwood, angelica, and other aromatic substances. It is much used in France and Italy as an "appetiser."

VERNE, JULES, *b.* at Nantes, 1828, a well-known and prolific author of boys' books, dealing cleverly with impossible inventions, and marvellous methods of overcoming the limitations that nature has placed on adventure in this world. "Around the Moon," "Twenty Thousand Leagues under the Sea," and "Around the World in Eighty Days," show by their title the nature of his works.

VERNIER, PIERRE, *b.* 1580, *d.* 1637, spent most of his days in the Netherlands in the service of Spain. He invented the mechanism of the auxiliary scale known as the *vernier,* which enables minute measurements in lines and angles to be made. Micrometer-screws, graduated on the head, have now largely taken the place of the linear verniers which slid along the face of the principal scale.

VERONA, an old city, finely placed at the foot of the Alps, 72 miles west of Venice. It has many interesting Roman remains, and is rich in mediæval art treasures. It trades with Germany by the Brenner Pass and railway, and is the centre of a considerable industry in wine and oil: population 60,000.

VERONESE, PAOLO, *b.* in Verona, whence he took his surname, 1528, *d.* 1588. He was the last of the great Venetian painters, and, like them, was a great colourist. His "Saint Helena's Vision of the Cross" in the National Gallery, exemplifies his boldness as a designer and colourist.

VERONICA, SAINT, a legendary saint, supposed to be one of the holy women who followed our Lord to Calvary. She gave to Him her veil to wipe His brow, and the impression of His features remained on it. Milan and Rome claim to possess the true *veronica* (as the veil is called), and Chaucer tells us that "vernicles" were sold by palmers in his day.

VERST, a Russian measure of length, about two-thirds of an English mile.

VERSAILLES, a city near Paris, with a famous palace, now used as a museum and picture gallery, and surrounded by handsome gardens. Louis XIV. made the palace and gardens as they are now. Versailles has been the scene of many historical events. Here was signed the Treaty, in 1783, which concluded the American War of Independence. It was here that the National Assembly met, in 1789, and took the government into their own hands. On the fall of the Bastile, a mob from Paris overran the Palace and forced the king and queen to accompany them to Paris. In the siege of Paris by the Germans, 1870-71, Versailles was the head-quarters of the German army, and in its Palace the King of Prussia was solemnly proclaimed German Emperor.

VERTEBRATA, a term of very wide application denoting all the members of the animal kingdom possessing a backbone. It thus includes mammals, birds, reptiles, fishes, and other sub-classes. Animals, on the other hand, such as shell-fish, worms, insects, and molluscs, which have no backbone, are classified under the term "invertebrata."

VERULAM, the Roman name of St. Albans (which see). Francis Bacon, Lord Verulam, is buried in St. Michael's Church, St. Albans, where a well-known effigy of the philosopher is to be seen on the north wall of the chancel.

VESPASIAN, Titus Flavius, Emperor of Rome from 70-79 A.D., rose from the ranks as a soldier to imperial power. In his reign Jerusalem fell, the Colosseum was begun, and Britain was effectually subdued to the Roman power by Julius Agricola.

VESPUCCI, AMERIGO. See *Amerigo.*

VESTA, a virgin goddess of the Romans, who typified the sanctity of "hearth and home," and the civic unity of each city. A shrine to her honour existed in every home, and a sacred fire was kept burning in the Vestal temple of every city. Rome, the centre of her worship, had six Vestal virgins to keep alight the sacred fire and perform the rites of her worship.

VESUVIUS, MOUNT, an active volcano, 4,200 feet in height, situated south-west of Naples at a distance of 10 miles. Its most destructive eruption (79 A.D.) buried Pompeii in a deposit of mud and ashes, and Herculaneum by a flow of lava. A great outburst occurred in 1871–2, but owing to the fertility of the soil, the district was soon reoccupied and replanted with vineyards, only to be again devastated by a mightier eruption in 1906.

VETERINARY SURGEON, one whose work is chiefly connected with the diseases of the larger domestic animals—horses, cows, sheep, etc. Dogs and cats also come under his care. Until 1881, practically any one could call himself a Veterinary surgeon, but in that year an Act was passed requiring certain qualifications to entitle a man to practise as a "Vet." Refer to "Veterinary Surgeon" in *Index.*

VIA DOLOROSA, "the dolorous way," the name given by Christians to the road from the Mount of Olives to Golgotha.

VIA MEDIA, "the middle way," the way which at the Reformation was deliberately taken by the Church of England between Rome and Geneva. "It hath been her wisdom ever since the first compiling of her Public Liturgy to keep the mean between two extremes."

VIATICUM, "provision for a journey," is a term applied to the administration of the Holy Communion to a person in immediate danger of death.

VICAR OF BRAY, the parson of a village in Berks, named Simon Alleyn, who, according to Fuller, was "twice a Papist and twice a Protestant" in the reigns of Henry VIII. and his three successors. He is the subject of a humorous old English ballad.

VICHY, a small town almost in the middle of France, on the river Allier. Its hot alkaline springs are very valuable in disorders of the stomach and liver, and millions of bottles are annually exported. The town is handsome, and the surroundings beautiful; population 20,000.

VICTOR EMMANUEL II., *b.* 1820, *d.* 1878, was the first king of the reconstituted union of Italian States, now known as Italy. He succeeded his father as King of Sardinia in 1849, and, by the events of the time and under the guiding hand of his minister, Count Cavour, became King of Italy in 1870. His hardihood and homeliness endeared him to all his subjects.

VICTOR EMMANUEL III., *b.* 1869, King of Italy, and grandson of the above, succeeded to the throne in 1900. An heir to the king was born in 1904, to the great joy of all Italy.

VICTORIA, QUEEN, the only child of the Duke of Kent, fourth son of George III., was born at Kensington Palace, May 24th, 1819, and died at Osborne, 22nd January, 1901. Her mother, a princess of Saxe-Coburg, was a sister of King Leopold of Belgium. When the little princess was eight months old, her father died, but her education was admirably cared for by her mother, Viscount Melbourne aiding in the political education of the future queen. She ascended the throne of England in 1837, but the Hanoverian kingdom passed, by the Salic law, to her uncle, the Duke of Cumberland, and so the connection of England and Hanover ceased, to the great relief of the nation. Crowned in 1838, Queen Victoria married her cousin, Prince Albert of Saxe-Coburg, in 1840, and the royal household became an example of all that is best in English home life. The queen had four sons and five daughters. The royal family resided chiefly at Windsor, at Osborne in the Isle of Wight, and at Balmoral in the Highlands. The queen's affection for Balmoral is shown in the unpretentious little diaries which she published in 1868 and 1884, under the title of "Leaves from the Journal of our Life in the Highlands," and "More Leaves." The death of the Prince Consort in 1861 caused the queen to withdraw from public functions for many years. She personally supervised the "Life of the Prince Consort," written by Sir Theodore Martin. The sympathy of the queen with movements that aroused the spirit of her people was always spontaneous, and she never failed to associate herself with them in a manner that bore fruit after the excitement of the time had passed. Thus, she instituted the Victoria Cross "For Valour," during the Crimean War; she set her seal upon the Volunteer Movement, and the formation of the National Rifle Association by founding the "Queen's Prize," and the Indian Mutiny prompted her to establish the order of "The Star of India," to reward native loyalty.

Two jubilees were held, one in 1887 and the other in 1897, in celebration of the Queen's long and glorious reign. The love and loyalty shown on these occasions could hardly have been surpassed. And the enthusiasm evoked by

the Queen's brave and generous conduct during the Boer War was unbounded. Throughout her long reign Queen Victoria was ever the centre of our national life, and the vital link between all parts of her world-wide empire. The purity of her court, and her impartial dignity and homely sympathy, commanded universal admiration and respect, and her death was regarded as a personal bereavement by every class of her numerous subjects. Her body was conveyed on the *Alberta* under a white pall, across the Solent, through a solemn avenue of war-ships. It was borne in procession through London on a gun carriage, followed by the King and the German Emperor as chief mourners, and it now rests by the side of the Prince Consort's in the royal mausoleum at Frogmore, near Windsor.

VICTORIA (colony), originally part of New South Wales, was constituted a separate colony in 1851. It lies south of the Murray River, occupying the south-eastern corner of the continent. It is the richest gold-yielding state in Australia, over £260,000,000 having been raised there since 1851. Wool, wheat, and butter are the chief exports, and wine is a growing industry. Melbourne, the chief city, is remarkable for its fine public buildings, and for the fact that it contains about two-fifths of the population of the whole colony, namely 500,000 out of 1,250,000. Ballarat and Bendigo are the chief gold centres. Refer to "Victoria" in *Index*.

VICTORIA (city), (1) the capital of the province of British Columbia, has a population of 22,000. It is beautifully situated at the south-east of Vancouver Island; (2) the capital of Hong Kong, has a population of 182,000. It lies along the northern shore of the island, facing the mainland, and overlooking one of the finest harbours in the world. The port is free, is well fortified, and has excellent dock accommodation.

VICTORIA (ship), the name of Sir George Tryon's flag-ship; a battleship which collided with the *Camperdown* off Tripoli, while manœuvring under the admiral's orders, and went down with the loss of the admiral and 338 men, June 22nd, 1893.

VICTORIA BRIDGE, a tubular, iron bridge two miles long, built across the St. Lawrence, at Montreal, by Robert Stephenson, 1854-59. It has been replaced by the Victoria Jubilee Bridge, opened in 1898.

VICTORIA CROSS, THE. Refer to *Index*.

VICTORIA FALLS, THE, on the Zambesi River, at a point 900 miles from the sea, are as great and noble as those of Niagara. They were discovered and named in 1855 by Livingstone. The river, three-quarters of a mile wide, falls by five streams sheer into a ravine 400 feet deep, from which it emerges by a remarkable cliff-walled, winding channel. The gorge, 700 yards below the Falls, is spanned by a railway bridge, opened in 1905, 650 ft. long and 450 ft. above the river surface.

VICTORIA NYANZA, a great lake in Central Africa, 4,000 feet above sea-level. The lake, which is drained by the Nile, was visited by Speke and Burton in 1858, and proved by the former to be the source of the Nile, 1860-63.

VICTORIA REGIA, a flowering water-plant found in the Amazon and other rivers in the north-east of South America. The leaves have a diameter of 5 to 6 feet, and resemble our white water-lily; the flowers, a foot in diameter, are white and rose-centred, with a very fragrant scent. The Victoria Regia is cultivated at Kew.

VICTORY, THE, Nelson's flag-ship at Trafalgar. Struck on the shoulder by a musket-shot which pierced his lungs, the great admiral died in the cock-pit of the *Victory*, while the battle was raging. The vessel lies in Portsmouth Harbour, and is open to public inspection.

VICUNA, a South American animal not unlike a deer, but allied to the camel. It has valuable wool used for weaving vicuna cloth. Its fleetness is great, and it haunts the hilly country of the Cordilleras, much as the chamois does the Alps.

VIENNA, the capital of Austria, stands near the Danube in Lower Austria. The old boundaries of the inner city are marked by the Ringstrasse, a series of wide, handsome boulevards. Within this area are the Hofburg or royal palace, and the cathedral of St. Stephen. Among the many parks, the Prater is foremost, both in extent and interest. The university of Vienna has a famous medical side, and the hospitals are well-known. Musical and scientific instruments, artistic goods, and bent wood furniture, are among the chief manufactures of the city. The Danube is now rendered permanently navigable to Vienna, and a great trade is done in grain, cattle, and wines; population 1,800,000.

VIENNA, CONGRESS OF, held at Vienna, September, 1814–June, 1815, to settle the territories of the various European nations after the Napoleonic wars. It was finally agreed that France should have the limits existing at the outbreak of the French Revolution, that Austria should take northern Italy, that Prussia should have a part of Saxony and the Rhenish Province, that Poland should form a kingdom under the Czar of Russia, and that Britain should retain Malta and Heligoland, Ceylon and Mauritius, Cape Colony, and a part of Guiana; whilst the Swiss Confederacy was reconstituted, the kingdom of the Netherlands, including Holland and Belgium, was established, and the former dynasties in Spain, Naples, Tuscany, Modena, and Sardinia were restored.

VIEUXTEMPS, HENRI, *b.* in Belgium, 1820, *d.* 1881, one of the foremost violinists of his day, and the composer of much well-known violin music.

VIGIL, the day and night immediately preceding certain feasts in the Roman and Anglican Churches, to be observed as fasting days. Vigils are noted in the Book of Common Prayer, but no special service is authorised. Originally the Vigil was a public watch-night service.

VIGNETTE, a small picture, engraving, or design, without border, often placed on the title page of a book. The title pages of the "Golden Treasury" series exemplify this use of vignettes. Originally vignettes were small, conventional designs of vine leaves and fruit.

VIGO, a naval station in Spain. Off the harbour, in 1702, an English and Dutch fleet defeated the French.

VIK-INGS, dwellers in the *viks* or creeks of Scandinavia, were the Norsemen or Danes who ravaged the coasts of England and Northern France in the 9th and 10th centuries.

VILLARS, MARSHAL, *b.* 1653, *d.* 1734, one of Louis XIV.'s great marshals, served as a young man under Condé and Turenne. In the war of the Spanish Succession, he gave Marlborough great trouble, but was defeated by him at Ramillies (1706), and Malplaquet (1709). To the end of his life he remained the military genius of France.

VILLENEUVE, PIERRE, *b.* 1763, *d.* 1806, Nelson's antagonist at Trafalgar. His ship, the *Bucentaure*, was taken, and he was carried prisoner to England. On his return to France he committed suicide.

VILLIERS, GEORGE, first Duke of Buckingham, *b.* 1592, *d.* 1628, the chief favourite and adviser of Charles I. during the early part of his reign, as he had been of James I. for the last nine years of his rule. His autocratic arrogance was resented by the people and the Parliament, and he was assassinated at Portsmouth by John Felton, an officer who had served under him in France.

VINCENT DE PAUL, SAINT, *b.* 1576, *d.* 1660, a Roman Catholic Saint who did much mission-work in the prisons and among the galley-slaves of France. He founded the Society of the Lazarists, mission-priests who assist parochial clergy, and also the Foundling Hospital of Paris. He founded, too, the Sisterhood of Charity, and is commemorated himself as Patron Saint of the modern "Society of Vincent de Paul," a brotherhood that assists the poor.

VINCI, LEONARDO DA. See *Leonardo da Vinci*.

VINE, THE GRAPE, a highly cultivated species of the wild vine which is found in Persia and Southern Asia. It cannot be raised from seed without the probability of a reversion to an inferior type. The French and Rhenish vines are kept cut back to a height of 3 or 4 feet, but Italian vines are allowed more growth and are trained on trellises. California, Victoria, and South Australia are entering into keen competition with Europe as wine-producing countries. In England, vine-culture is almost confined to hot-houses, and among notable vines may be mentioned that at Hampton Court.

VINEGAR is a form of acetic acid used for cooking, preserving, and pickling. In England it is made from malt by brewing a weak wort, which is treated with yeast, and heated in a dark room until fermentation is complete. Vinegar is made in France from wines that are sour, and from the fermentation of grape skins.

VINEGAR HILL, in Co. Wexford, Ireland, is a low hill, which was held for a month as a camp by Irish rebels in 1798. Here they were attacked by General Lake and utterly routed.

VIOLA, THE, a violin intermediate in size and compass between a 'cello and a violin. Its top string is A, the others being D, G, and C in turn below. All the strings are of gut, but the G and C strings are covered with silvered wire.

VIOLIN, THE, the most important of the stringed instruments of music. Like the *viola*, it has four strings, the bass or G string being of gut covered with silvered wire, the others, D, A, and E in ascending order, being of gut. The bow is made of horse-hair. The greatest violins were those made at Cremona during the 17th and 18th centuries, by the Amati family, and their pupil, Stradivarius. The best known modern makers are in Paris.

VIOLONCELLO, a large instrument of the violin class, held by the performer between his knees. Its strings are tuned an octave below those of the viola (which see). It has a deep, sympathetic tone, and is wonderfully effective in orchestral work.

VIPER, the name given to a genus of venomous snakes, of which the common adder is a species. Other species abound in Africa and India. The adder, or English viper, is seldom more than 2 feet long; it has a pair of divergent marks behind the eyes, and its back is covered with diamond-shaped spots, the belly being of a bluish colour. The bite of an adder is poisonous and has sometimes proved fatal.

VIRCHOW, RUDOLF, *b.* in Prussia, 1821, a leading German anatomist, physiologist, pathologist, and anthropologist, who founded the branch of medical research known as cellular pathology. His influence on the improvement of asylums and hospitals has been most beneficent. In October, 1901, Professor Virchow's 80th birthday was celebrated by a meeting of representative scientists from every country, and the Professor addressed his audience for two hours.

VIRGIL. See *Vergil.*

VIRGINIA WATER, an artificial lake in the Great Park of Windsor. It was begun in 1746 by the Duke of Cumberland, and various features have been added from time to time until, with its waterfall, ruins, and cavern, it offers many attractions to the visitor.

VIRGIN MARY, THE, the mother of Jesus. The Roman Catholic doctrine of her immaculate conception, and her consequent sinlessness, was first recognised by a Papal Bull in 1854.

VIRGINIA, (1) the daughter of a plebeian named Virginius, who slew her to save her from the lust of one of the patrician decemvirs, Appius Claudius. (2) The first of the American colonies, founded in 1607 by a permanent settlement at Jamestown. The name was given in honour of the Virgin Queen, Elizabeth, by Sir Walter Raleigh, who made three unsuccessful attempts to colonise it. Its sea-board is largely occupied by Chesapeake Bay, and its interior by the Appalachian Mountains. Richmond is its capital. It is the second tobacco-producing state, and is rich in minerals and agricultural wealth; population 1,750,000.

VISHNU, the second member of the triad in Hindu mythology, Brahma, Vishnu, and Shiva, the creating, preserving and destroying deities respectively. Buddha was regarded by many as one of the ten avatars, or manifestations in the flesh, of Vishnu, each avatar being intended to deliver mankind from some evil. The Ganges is said to issue from Vishnu's foot.

VISIGOTHS. See *Goths.*

VISION OF PIERS PLOWMAN, THE, an allegorical poem written in alliterative verse by Langland, a contemporary of Chaucer, to show up the abuses of the ecclesiastical orders and of the court, and to increase respect for the working or "plowman" class.

VISTULA, a river of the central plain of Europe, which rises in the Carpathians, flows through Poland, past Cracow and Warsaw, and, after a course of 650 miles enters the sea by a delta, on which stands the town of Dantzig.

VITAL STATISTICS, statistics with regard to the population of a country as to its increase or decrease, and the causes which have led, or are leading to one or the other. The two most important points that vital statistics reveal to us are (1) that a decrease of mortality has accompanied sanitary improvements, and (2) that the birth-rate has much declined in the last few years.

VITRIOL, or sulphuric acid, is known as oil of vitriol when concentrated. The name is variously applied to the compounds of sulphuric acid known as sulphates; thus, blue vitriol is copper sulphate, and white vitriol is zinc sulphate.

VITTORIA, the capital of a small Basque province in northern Spain, was the scene of the last and greatest of Wellington's Peninsula victories, 1813.

VITUS, SAINT, a 4th century martyr of the Roman Catholic Church, which celebrates his festival on June 15th. The practice of dancing before the shrine of Saint Vitus to ensure good health for another year, has caused the name of the saint to be connected with a nervous disorder commonly called St. Vitus's Dance.

VIVANDIÈRE, a woman who accompanies a French regiment as a seller of fruit, provisions, and liquor. Formerly such women had uniforms, and their vivacity and pluck won them a place of honour in works of fiction, as, for instance, in Donizetti's opera, "The Daughter of the Regiment."

VIVIEN, a subtle enchantress, whose malicious influence did much to ruin the success of the Round Table. She became the mistress of Merlin, and, having gained from him his secret books, imprisoned him by his own spells under a thorn bush.

VIVISECTION, the practice of experimenting with the knife upon living creatures, or, generally, of conducting experiments upon live creatures. Anti-vivisectionists maintain that no advance in knowledge has been derived from vivisection, which might not have been attained by more humane methods, but most scientists deny this.

VIZIER, an Arabic word signifying burden-bearer, and used both in the Persian and Ottoman Empires to denote the chief minister of State. Under the Mogul emperors too, the title was used in the same way, and Nawab Vizier was the title of the rulers of Oudh till 1857.

VLADIVOSTOCK, a naval port, at the extremity of the Russian Trans-Siberian Railway. Founded in 1861, it became the head-quarters of the Russian Pacific Squadron, but it is ice-bound during the winter months.

VOICE is the sound produced by the vibrations of the vocal chords in the larynx, caused by an emission of breath from the lungs. The various cavities of the head and chest act as resonating chambers increasing the volume, and determining the quality of the voice. Female voices are termed soprano, mezzo-soprano, and contralto, according as the range of the dominant notes of the voice is high, medium, or low. A similar differentiation exists in men's voices under the terms alto, tenor, and bass. Boys' voices are known as trebles.

VOLAPÜK, the name of what was intended by its author, Johann Schleyer, a teacher of Constance, in Switzerland, to be a universal language. For some time after its invention in 1879 it flourished exceedingly, but then it languished, and its place is now taken by Esperanto, proposed by Dr. Zamenhof, of Warsaw, in 1887 (see *Esperanto*).

VOLCANO, primarily, a conical hill, consisting of lava, ashes, and débris, emitted from a tubular duct which communicates with a centre of heat activity under the crust of the earth. The mouth of the duct is called the crater, and an outburst of activity is termed an "eruption." A volcano which shows no discernible signs of further activity is said to be "extinct." It is generally considered that eruptions are caused by the sudden generation and explosion of steam near the centre of heat.

VOLGA, THE, the longest river in Europe, and the chief river of Russia, rises in the low Valdai hills, and, after a course of 2,400 miles enters the Caspian Sea. It is connected by canals with the White, Baltic, and Black Seas, and is of immense value as a means of communication. Its sturgeon fisheries are profitable, but the value of the river is best estimated by considering the dependence of the Great Fair of Nijni Novgorod, a town on its banks, upon the conveying power of the river.

VOLT, the unit of electro-motive force universally adopted. It was defined in 1893 by an International Electrical Congress in terms of the ohm and ampere. The name is derived from Volta, an Italian physicist.

VOLTA, ALESSANDRE, *b.* at Como, 1745, *d.* 1826, an eminent physicist, whose discoveries in electricity have been commemorated by the adoption of the terms *volt* and *voltaic.*

VOLTAIRE, *b.* in Paris, 1694, *d.* 1778, a poet, dramatist, philosopher, and theological critic, is justly considered to have been one of the greatest of French writers. Educated in a Jesuit College, his earliest works were anti-clerical, and his subsequent lampoons caused him to become an exile in England. He became a great friend of Frederick the Great, and resided at his Prussian court. He was a keen and successful business speculator, and became in this way a man of great wealth. After a banishment of thirty-four years, he returned to Paris, to be acclaimed as a hero of liberalism, and there he died in his eighty-fifth year. His chief works were the "Henriade," an epic of the Protestant king, Henri IV., "Letters on the English," "Candide," and "Irene," a tragedy which was rapturously received in Paris in his last years. He also wrote voluminous historical and philosophical works.

VOLUNTARYISM, the system of supporting institutions by voluntary subscriptions. It also is a term used to denote the principles of those who, in the interests of religious equality, demand the disestablishment and disendowment of established churches, and who insist that religious liberty is dependent on the voluntary and unaided support of the members of each cult, sect, or congregation.

VOLUNTEERS. The volunteer movement commenced spontaneously in Great Britain in 1859, when the nation was troubled by the menacing attitude of the French. No monetary assistance was given by the Government, nor was any equipment provided. In 1861 the Queen reviewed in Hyde Park, and in Edinburgh, two gatherings of volunteers to the number of 80,000 men. Subsequently, equipment and uniforms were provided, and in 1872 the first great volunteer force encamped and manœuvred on Salisbury Plain. Since then, annual camps and manœuvres have been held all over the country. Volunteer battalions are attached to the line-battalions of regulars in their district, and are under the command of the Colonel commanding the regulars. Their motto is *Defence, not Defiance.*

VORTIGERN, according to Bede, a British prince who invited the Jute rovers, Hengist and Horsa, to assist him to repel the Picts. He is further said to have married Rowena, the daughter of Hengist.

VULCAN, the Roman god of fire, and the forge, to whom the characteristics of the Greek god, Hephæstus, were ascribed. His seat was fabled to be Mount Etna, which therefore received the name *volcano,* a name afterwards extended to all similar mountains.

VULCANITE, or ebonite, a dark brown or black form of india-rubber. Its hardness is due to the presence of more sulphur than soft rubber contains, and to the fact that it is "vulcanised" at a higher temperature. It is used for the mouth-pieces of pipes, for combs, the black keys in cheaper pianos, for screw-stoppers in bottles, and largely as an insulator in electrical instruments.

VULGATE, THE, the Latin version of the Holy Scriptures accepted as the

authorised version of the Roman Catholic Church. It was the work of Jerome, a learned doctor of the Western Church. He translated the Old Testament direct from the Hebrew, and the New Testament from the Greek version of Origen's Hexapla. The work was completed 405 A.D. There was a still older Latin version, which, in spite of its many errors, was not entirely superseded by Jerome's version until the 9th century.

VULTURE, a species of carrion-feeding bird found in both the New World and the Old, the vulture of the Andes being commonly known as the Condor. They are found in inaccessible Alpine heights, and on the deserts of Africa, whilst they also pick up carrion or garbage in Eastern cities. Keen-eyed, with powerful beak, and long powerful wings, these birds descry carrion from afar. They feed on the ground, and are unable to carry off their prey by reason of the comparative weakness of their talons.

WADING BIRDS, an order of birds distinguished by their long legs, which enable them to stand in water and look for their prey. Their legs are not feathered, the tail is short, beak long and generally somewhat flattened, wings fully developed. They haunt marshy ground and shallow water, seeking small fish, worms, and insects. The stork, lapwing, plover, bustard, crane, and heron are well-known waders, but there are many others.

WADY HALFA. "Wady" is an Arabic word signifying river bed, ravine, or valley. Wady Halfa is a small town on the Nile just below the second cataract, and near the boundary line of Egypt proper and Nubia. For some years after the "Gordon" disaster, it formed the southern limit of Egyptian rule. From here Kitchener made a railway across the Nubian desert to Abu Hamed, whence he made the great advance to Khartoum; population about 3,500.

WAFER, a small circular piece of unleavened bread used by Roman Catholics in celebrating the Holy Eucharist.

WAGER, a contract between two persons that one shall pay the other an agreed sum of money or some stated object, according as a certain future event shall turn out. Generally speaking, wagers are not now enforceable by law, whence arose the current term "debt of honour," to denote money lost in gaming or racing. The old "wager of battle" was, of course, a most illogical mode of settling a dispute, as the aggrieved party staked his life that victory would fall to the right. It was formally abolished in 1819.

WAGES, money, or other compensation, given to a person in return for his labour. Agreement between the capitalist, or hirer, and the labourer, has always been difficult to obtain. Any sudden demand for labour, as after the great Chicago fire, naturally increases wages, while a continued slackening of the demand as surely lowers them. In ignorance of this, many laws were passed, from Edward III. onwards, to regulate wages, but in vain. As a rule, wages must be paid in money, and not at a public-house; they are also recoverable before other debts.

WAGNER, WILHELM RICHARD, *b.* 1813, *d.* 1883, the great German composer and musical revolutionist, was born in Leipsic and educated at Dresden. His early musical career was not brilliantly successful, but after his "Rienzi" was produced in 1842, he had no difficulty in gaining public attention. The "Flying Dutchman" and the beautiful "Tannhäuser" saw him firmly established as a genius. King Ludwig of Bavaria proved a steady friend, and with others assisted in the foundation of the now famous theatre at Bayreuth, which was opened in 1876, where Wagner saw at last his "Ring des Nibelungen" performed. His last opera, "Parsifal," is perhaps his masterpiece.

WAGRAM, a village a few miles north-east of Vienna, where Napoleon severely defeated the Austrians in 1809. This victory, followed by the treaty of Schönbrunn, kept Bonaparte's continental enemies quiet till his impolitic invasion of Russia gave them their opportunity.

WAITS, a body of musicians formerly kept by some great person to announce the hours of the night. Many cities and towns also had their regular "*waits*," and from them the name was transferred to persons who perambulate the streets about Christmas-time singing Christmas hymns and carols.

WAKEFIELD, a handsome and flourishing Yorkshire town, on the river Calder, 9 miles south of Leeds. In 1888 it became the seat of a bishopric, and its handsome parish church, now the cathedral, was afterwards restored and enlarged as a memorial to Bishop Walsham How. Wakefield is an important agricultural market, and has many cloth mills and other works. Here Richard of York was defeated and slain by Margaret of Anjou, 1460.

WALCHEREN, an island of Holland at the mouth of the Scheldt, having an area of about 80 square miles. On it is Flushing (population 10,000), a seaport of considerable trade with England and other countries. The siege of Flushing proved the destruction of the Walcheren expedition of 1809, for had Lord Chatham, the commander, moved at once on Antwerp, instead of staying to reduce Walcheren, he might have taken that important town, and saved his men from the ravages of disease.

WALDENSES (Vaudois), Protestants of France and Italy who were much persecuted in the 12th and succeeding centuries. In 1170, Ralph Waldo, a rich merchant of Lyons, who had studied the Bible and the early Fathers, began preaching a simpler form of religion to his neighbours. He soon had many followers, who tried to fashion their lives by the precepts of the Gospel, and separated from the Roman Catholic Church. Persecution followed, and in time they were almost exterminated in France, but in Italy their congregations continued to exist.

WALES, where we may still find the descendants of the Britons almost in their ancient purity of race, has an area of 7,300 square miles. Its mountains formed a secure refuge for the Britons when the dreaded Saxons took all the rest of their land. They took with them their language, their religion, and their spirit of disunion. For centuries after England was a united kingdom Wales was split up between petty rival chiefs, whom the English kings played one against the other till the time came to annex their country to England. The mistaken policy of Llewellyn, who aided de Montfort against Henry III., perhaps spurred on Edward I. to make greater efforts than he would have made to subdue Wales, and from his time the English were masters, though the Welsh often struggled against the yoke. He made his son (Edward II.), Prince of Wales, and from that time this title has always been held by the sovereign's eldest son. The hilly surface and the humidity of the climate, render Wales more adapted for pasture than for agriculture. The mines of Wales are highly important, coal, iron, lead, and slate being widely distributed. The woollen industry of North Wales has its head-quarters at Newtown. Holyhead is an important packet-station for communication with Ireland. Milford Haven, in Pembrokeshire, is one of the finest harbours in the world. For Swansea and Cardiff, see under these headings. The great majority of the people, especially of the working-classes, are Nonconformists.

WALES, PRINCE OF. From the time of Edward I. the sovereign's eldest son has always been styled Prince of Wales. The title is not hereditary, and is usually conferred by letters patent. The title of Earl of Chester is usually conferred at the same time, but that of Duke of Cornwall belongs to the eldest son by inheritance. He also inherits various Scottish titles, as well as that of Earl of Dublin. His Majesty, Edward VII., held the title of Prince of Wales longer than any before. In that capacity he visited the United States and Canada in 1860, and India in 1875. See *George, Prince of Wales.*

WALHALLA. See *Valhalla.*

WALKER, GEORGE, the valiant clergyman who roused the people of Londonderry to defend themselves against the army of James II., when deserted by their governor, Lundy, in 1688. The siege lasted 105 days, Walker all the time exhorting the citizens in the cathedral, and leading them in the field. He fell in the Battle of the Boyne, 1690. His statue stands on the walls of Londonderry.

WALLACE, ALFRED RUSSEL, *b.* at Usk, 1822, was a co-discoverer with Darwin of the "Origin of Species" and devoted his life to travel in pursuit of botanical and zoological knowledge. He added much to our knowledge of the Amazon Valley, and the interior of the Malay Peninsula. "Travels on the Amazon," "The Malay Archipelago," and "The Geographical Distribution of Animals," are his chief works.

WALLACE, SIR RICHARD, *b.* 1818, *d.* 1890; one of the keenest art connoisseurs of late years, was born in London, but passed much of his life in Paris. During the siege of Paris, 1871, he spent vast sums in ministering to the sick and wounded. The splendid collection of pictures and "objets d'art," which he received from his putative father, the Marquis of Hertford, was kept intact after his death, and bequeathed by his widow to the nation. [For "Wallace Collection" refer to *Index.*]

WALLACE, SIR WILLIAM, the champion of Scottish freedom against Edward I., was probably a son of Sir Malcolm Wallace, of Elderslie, near Paisley. In 1297 he headed an insurrection against the English, and was for some time marvellously successful. He defeated the English army under Surrey and Cressingham near Stirling, and afterwards raided the north of England. In 1298 Edward headed a great army against him, defeating him at Falkirk. In 1305 he was taken prisoner, carried to London, and put to death as a traitor.

WALLACHIA, the southern half of *Roumania* (which see).

WALLER, EDMUND, *b.* at Coleshill, Herts., 1605, *d.* 1687, one of the most graceful of English poets. He was a trusted member of the popular party in the Long Parliament, and was detected in plotting for Charles. He wrote a fine panegyric on Cromwell, and another for Charles II. on his restoration. His poems, chiefly on topics of the day, are marked by smoothness and elegance. His verses to "Sacharissa" are his most characteristic production.

WALL OF CHINA, GREAT, a great wall, broken at regular intervals by square towers, and stretching along the north-western boundary of China, from a point

on the coast of the Gulf of Pe-chi-li to the north-western corner of the Kan-su province, a distance of nearly 1,500 miles. It varies considerably in height and thickness and state of repair. Within easy reach of Peking it is a splendid wall, 40 feet in height and wide enough at the top for two carriages to drive abreast. But in more remote parts it is a miserable mud wall, not 20 feet high, of no great breadth, and with gaps here and there from a quarter to half a mile in width. The wall was begun in 214 B.C., and was intended as a protection to China from Mongol invasion.

WALLOONS, the inhabitants of the south-eastern part of Belgium, southward of a line from Dunkirk to Maestricht. They are almost pure descendants of the old Belgae, who held their ground when Gaul was overrun by the Germans. They are steadily gaining on the other, or Flemish, part of the Belgian people.

WALLSEND, a small town near the mouth of the Tyne. Here the Roman wall constructed by Hadrian had its eastern termination. The famous Wallsend coal takes its name from the place; population 12,000.

WALL STREET, a street of New York City, famous as a financial centre, and the scene of many wild speculations in money matters.

WALMER CASTLE, in Kent, 2 miles south of Deal, was till recently the official residence of the Lord Warden of the Cinque Ports. Thus many distinguished men have resided here, including Pitt and the Duke of Wellington. The room in which Wellington died contains the hero's furniture, and there are many other relics to be seen by visitors. The Castle is now made over entirely to the public.

WALNUT, a valuable and handsome tree, native of Persia and India, but long domesticated in Europe. The nuts, when fresh gathered, are nutritious and digestible, but they deteriorate with keeping. The unripe nut makes excellent pickles and a good ketchup. Walnut wood has long been esteemed for its beautiful markings, its lightness, and its freedom from liability to split or warp. It makes an excellent veneer.

WALPOLE, HORACE, *b.* in London, 1717, *d.* 1797, third son of the great Sir Robert Walpole, was a voluminous, rather than a great writer. The Gothic villa he constructed at Strawberry Hill, near Twickenham, was long one of the sights of London, and together with its artistic contents, gives a clear insight into the character of the owner. His "Letters" and "Memoirs" are a valuable contribution to the history of his time.

WALPOLE, (Sir Robert,) **EARL OF ORFORD,** *b.* at Houghton, Norfolk, 1676, *d.* 1745, a great English statesman, if we look only to results. Educated at Eton and Cambridge, he entered Parliament at twenty-five, was a minister before he was thirty, and in a year or two was expelled the House of Commons on an almost imaginary charge of corruption. With the accession of George I. his opportunity came again. The skill with which he drew the nation out of the "South Sea Bubble" disasters stamped him as a genius in finance, and his astute use of bribery gave him a twenty years' lease of power. His opposition to the War with Spain added to the unpopularity his reforms had excited, and he retired in 1742.

WALPURGIS NIGHT, the eve of the 1st of May. Saint Walpurgis, or Walpurga, an English nun, went, in the middle of the 8th century, as a missionary to Germany. She was very successful, and was held in great honour. The eve of her festival was supposed to be a favourite meeting-time of witches and other workers of evil, whence the night of the 30th April is known in German legend as Walpurgis Night.

WALRUS, an animal allied to the seal, and haunting the same regions, the Arctic and Antarctic Seas. They may attain a length of 10 or 12 feet, and have conspicuous tusks, often a foot and a half in length. These they use as weapons, and by them they hoist themselves out of the water on to the ice. Their food consists of fishes, shell-fish, etc. The tusks afford excellent ivory, and the skin a very durable leather.

WALSALL, a town of ancient origin in Staffordshire, 8 miles N.W. of Birmingham. Standing on the edge of the Black Country it manufactures a varied assortment of iron and brass utensils, besides various leather goods. In the vicinity are numerous coal-pits and limestone quarries. (For population, etc., see p. 902.)

WALSINGHAM, SIR FRANCIS, *b.* at Chiselhurst, Kent, 1530, *d.* 1590; one of the greatest of Elizabeth's great statesmen. A zealous protestant, he travelled abroad during Mary's reign, and thus acquired an invaluable knowledge of continental politics. He is said to have done more than any other to bring about the execution of Mary, Queen of Scots. His administration of foreign affairs was marked by sagacity, acuteness, and diplomatic deception.

WALTER, JOHN, the name of the first three managers of the "Times" newspaper. The first John Walter started, on January 1st, 1785, the "Universal Daily Register," which in 1788 was renamed the "Times." The second John Walter made the "Times" the power it now is. Taking up the management in 1803, till 1810 he was also editor. His management, lasting till 1847, saw the "Times" established as the greatest journal for news and correspondence in the world. He died 1894.

WALTER, LUCY, the mother of James Duke of Monmouth, was said by many to have been married to Charles II. while he was in exile in Holland. Cromwell undoubtedly acted as if he believed her to be so, for on her coming to England in 1656, he sent her to the Tower, and afterwards banished her to France.

WALTHAM ABBEY, or Waltham Holy Cross, is a market town of Essex, on the river Lea, about 12 miles from London. It derives its importance from being the site of a great gunpowder factory, and its interest from the Abbey and the Cross. Of the Abbey, founded, or rather rebuilt by Harold only the nave remains. The cross is one of the original ones erected by Edward I. in memory of Queen Eleanor.

WALTON, IZAAK, *b.* at Stafford, 1593, *d.* 1683, brother-in-law of Bp. Ken, was a linen-draper of London, who amassed a modest fortune and retired early to enjoy it in the society of some of the most cultured men of his time. His great book, the "Compleat Angler," is not his only work, for his "Lives" are admirable biographies.

WALTZ. This graceful dance originated in Bohemia, and was introduced into England in 1813. Musically, a waltz is a piece of music in triple time to accompany the dance. The term waltz is also applied to a classical form of composition in triple time.

WALVISCH BAY, or **WALFISH BAY,** a bay and adjacent British territory with an area of about 720 square miles, situated in South Africa, about 420 miles north of the Orange River. It is a favourite place of call for whalers. Surrounded by German territory, its commercial value can never be very great; population under 2,000.

WANDERING JEW, a Jew who, according to tradition, told Jesus to get on faster when on his way to Calvary, and was told in return to tarry on earth till Christ should come again. This story, so adapted to romantic developments, has been used by many writers, both in poetry and prose, and many instances have been gravely related of his appearance.

WANDEWASH. See *Coote.*

WANTAGE, a market-town of Berkshire in the celebrated White Horse Vale, 26 miles north-west of Reading. Here Alfred the Great was born, and a handsome marble statue commemorates him. The first steam-tramway in England was made in 1875 to connect Wantage with its railway station, 2½ miles away; population about 3,800.

WARBECK, PERKIN, an impostor tutored by the enemies of Henry VII. to represent Richard, Duke of York, who had been murdered in the Tower. The Duchess of Burgundy and the King of France affected to believe him to be the Duke. James IV. of Scotland received him, and gave him the hand of Lady Catherine Gordon. He came to England and raised an army, but ran away on the eve of battle, to be taken prisoner and eventually beheaded, 1499.

WARD, ARTEMUS. See *Browne, C. F.*

WARD, EDWARD MATTHEW, *b.* in London, 1816, *d.* 1879; historical painter, studied at the Royal Academy, at Rome, and at Munich. His first success was "Dr. Johnson perusing the Manuscript of the Vicar of Wakefield," in 1843. Subsequently he had a large share in decorating the Houses of Parliament. His "Charlotte Corday led to Execution," "The Last Sleep of Argyll," and other historical pictures are much admired. He died by his own hand.

WARD, MRS. HUMPHRY (Mary Augusta Arnold), *b.* in Tasmania, 1851, granddaughter of the great Arnold of Rugby, married Mr. Thomas Humphry Ward in 1872, and almost immediately became a well-known writer. "Robert Elsmere," which remains her masterpiece, appealed to a wide audience of thoughtful people.

WAR OF 1812, a war between Great Britain and the United States. The main cause of this war was the British claim to search all vessels on the high seas for deserters, and the fact that as a result many American subjects had been forced to serve on British men-of-war. Moreover, the "Continental System" of Napoleon and the British counter measures were ruining American commerce. The incidents of the war were few, and not of great importance. The Americans attempted an invasion of Canada, which was repelled, and the English were driven back in an attack on the States by way of New Orleans, after they had taken the city of Washington and destroyed a great part of it. Peace was made in 1814.

WARRANT-OFFICERS, the highest class of petty officers in the navy, and of non-commissioned officers in the army.

WARRINGTON, an historic town of Lancashire on the Mersey, 18 miles from Liverpool. Its manufactures, varied and flourishing, include soap, leather, and iron. (For population, etc., see p. 902.)

WAR, RUSSO-JAPANESE. Russia's failure to carry out the Manchurian Convention, by which she had agreed to evacuate Manchuria in April, 1903, was considered a breach of faith by the Japanese; and the establishment of military posts in Korea, ostensibly for the protection of the timber concessions along the river Yalu, granted in 1896, together with the growing influence exerted by Russia in Korean affairs, led

to lengthy diplomatic negotiations between the two powers. Failing to obtain satisfactory assurances, Japan broke off negotiations on February 6th, 1904, and at once commenced hostilities. A torpedo attack was made on the Port Arthur fleet during the nights of the 8th and 9th, and several ships were badly damaged, and the following day two cruisers were sunk in Chemulpo Harbour. Port Arthur was bombarded from the sea, and attempts were made to "bottle up" the fleet by sinking old vessels in the channel. In a sortie from the harbour on April 13th, the battleship "Petropavlovsk," was sunk by a mine, the Russian admiral, Makaroff, and the famous painter, Verestchagin, going down with her.

These successes gave Admiral Togo sufficient command of the sea to enable the Japanese to pour troops into Korea. A portion of these under General Nogi occupied Kinchau, and, from the land side, began the investment of Port Arthur, which was defended by General Stoessel. Success at sea continued with the Japanese. Early in August the Port Arthur fleet made a sortie. In the ensuing battle Admiral Vitoft was killed, several ships were damaged and withdrew to the protection of the guns from the forts, while others, including the flagship, Cesarevitch, were dispersed to take shelter in neutral ports. Admiral Kamimura also inflicted a defeat on the Vladivostock squadron on the 14th of the same month.

The main armies concentrated in the north-west of Korea. The first land engagement took place at Ping-yang, and there was serious fighting at the Yalu. Admiral Alexieff had been appointed commander-in-chief of the Russian forces by land and sea, General Kuropatkin taking command of the main army. The Japanese, under the supreme command of Marshal Oyama, with General Kuroki in command of the right wing, and General Oku of the left, steadily pressed back the Russians. The latter fought with great courage and determination, but were frequently out-generalled and compelled to evacuate strong positions and retreat to previously prepared entrenched and fortified defences in the rear. Since the Napoleonic Wars no battles have been witnessed of such magnitude as those of Liao-Yang in August, and the Sha-ho in October. It is estimated that the troops engaged exceeded 400,000 men, and that the casualties in the Russian army alone in the latter battle numbered 45,000, including more than 13,000 killed. Alexieff was recalled, and General Kuropatkin left in sole command. Both the Japanese and Russians now settled down between Mukden and Liao-Yang to await reinforcements, and prepare for another battle.

From the first, the Japanese had pressed forward the investment of Port Arthur. The forts were protected by mines and live electric wires, and stubbornly held, but fell one after the other. Wolf Hill was captured in July, the other outer defences during August, and Metre Hill in December. In these assaults the Japanese sacrificed whole regiments, 25,000 men falling in the attacks on Metre Hill. After a siege of seven months, General Stoessel surrendered the fortress on New Year's Day, 1905, the Japanese securing 25,000 prisoners of war, 59 permanent forts, and 546 guns, together with a quantity of ammunition, and several battleships, cruisers, and gunboats which had been sunk in the harbour.

Strengthened by the victorious army, under General Nogi, from Port Arthur, Oyama began his attack on the Russian positions before Mukden, 24th February, 1905. The battle of Mukden that followed is considered the greatest in history, when are taken into account the number of men engaged, the extent of the battle-field, the havoc wrought in the ranks of the combatants, and the length of time over which the fighting continued. After a struggle lasting eleven days the Russians began their retreat, and three days later, March 10th, the victorious Japanese entered Mukden, the capital of Manchuria.

On 27th and 28th May the Russian Admiral was attacked in the Strait of Korea by Admiral Togo, who succeeded in taking or sinking nearly the whole Russian fleet. This decisive blow prepared the way for peace, which was practically concluded 29th August, 1905, the Russians agreeing to evacuate Manchuria, to cede the southern half of Saghalien to the Japanese, to leave Korea under their protection and to leave them in possession of the Liao-tung peninsula.

WARSAW, once the capital of the kingdom of Poland, and now the chief city of the Russian province of that name. It stands on the river Vistula, some 330 miles east of Berlin, having a population exceeding 700,000, one-third of whom are Jews. Although it has many fine palaces and mansions, the general appearance of the city by no means corresponds to its importance. As a manufacturing town, a railway centre, and a military centre, it stands easily first in south-western Russia. The various revolutionary movements in Poland have usually had their head-quarters in Warsaw.

WARS OF THE ROSES. This struggle between the rival houses of York and Lancaster for the English throne began with the battle of St. Albans, 1455, and ended in 1485 with the accession of Henry VII. after Bosworth Field. The Yorkist cause had as adherents most of the mercantile and moneyed classes, the Lancastrians most of the nobles. As the worthlessness of Richard II. had given the throne to Henry of Lancaster, so the feebleness of Henry VI. gave it to Edward of York. That the rival claims were to some extent united in Henry Tudor was an inestimable blessing to England. The Yorkists gained the battles of St. Albans (1st), 1455, Northampton, 1460, Mortimer's Cross, 1461, Towton, 1461, Hedgeley Moor and Hexham, 1464, Barnet, 1471, and Tewkesbury, 1471; and the Lancastrians those of Wakefield, 1460, St. Albans (2nd), 1461, and Bosworth, 1485.

WARWICK, an interesting town on the river Avon, county town of Warwickshire. Adjoining the town, and overlooking the Avon, is the stately castle of Warwick, dating back to the 14th century. The present earldom was created in 1746 for Lord Brooke, whose family had possessed the castle since 1605. Leicester Hospital, an asylum for aged soldiers, is most interesting, as is St. Mary's Church with its beautiful Beauchamp chapel; population 12,000.

WARWICK (Richard Nevil), **EARL OF,** the Kingmaker, *b.* 1428, *d.* 1471, was the eldest son of the Earl of Salisbury. He married Anne, daughter of the Earl of Warwick, and in her right succeeded to the Warwick title and estates. By Warwick's aid, Edward IV. gained the throne, but he did not intend to be the puppet of his powerful subject. Slighted and thwarted by the king, Warwick made friends with the Lancastrians, and drove Edward out of the country for a time. When the latter returned to do battle for his throne at Barnet Field, the Duke of Clarence, who had married Warwick's daughter, forsook his father-in-law and joined the king, his brother, thus giving him the victory. Warwick was slain in the battle.

WASH, THE, a large estuary on the East Coast, between the counties of Norfolk and Lincoln. It receives the waters of four rivers, the Witham, Welland, Nen, and Great Ouse. The greater part of its surface is uncovered at low water, and one can cross it with care, but two fairly deep channels remain, the Lynn Deeps, leading to Lynn and Wisbeach, and the Boston Deeps, leading to Boston. It was in attempting to cross the Wash at low tide that King John lost his baggage, including his crown and sceptre, 1216.

WASHINGTON, the capital of the United States, is situated in the District of Columbia, on the Potomac River, on the east coast of the States. Marked out by Washington himself as the future seat of government, its development has been guided so as to leave ample open spaces within the city. Almost in the centre is the Capitol, where Congress meets, a handsome building of white stone and marble, crowned with a noble dome supporting a bronze figure of Liberty. The White House, the official residence of the President, and other Government buildings are also handsome.

WASHINGTON, GEORGE, *b.* 1732, *d.* 1799, the hero of American independence, was of English parentage, though born in the New World. He gained his knowledge of war in campaigns against the French during the Seven Years War. Thus he was quite capable of taking the lead when the States declared their independence in 1775. When peace came, he did his country as good service as he had done in war, and it is largely to his foresight and perseverance that the soundness of the American constitution is due. He was the first President, elected in 1789, and held the office for a second term, being re-elected in 1793. He left no children.

WASP, a family of insects embracing a good many species having marked characteristics, such as the possession of a sting, the building of a nest, and others less obvious. The life history of wasps much resembles that of bees, except that they do not store up food, and all die at the approach of winter, except a few females, which hibernate in a hole or under a stone. As warm weather approaches, the female revives and commences a nest, in which she begins to lay her eggs. Some of these soon hatch and develop, and then the mother-wasp has a band of workers to aid her in enlarging the nest for the eggs she continues to lay.

WASSAIL a favourite beverage of the Anglo-Saxons, made from ale, roasted apples, toast, sugar and spices. It played an important part at all their feasts.

WASTE PRODUCTS, UTILISATION OF. See *By-Products.*

WATCH, a timepiece whose mechanism is actuated by a spring, and which is small enough to be carried in the pocket. Till lately, every watch possessed a *spring*, a *barrel* to contain it, and a *fusee* to counteract the irregularity of the spring action, but now the fusee is often dispensed with and a much longer spring used. Watches were invented at Nuremberg some time before 1500, and called "Nuremberg eggs."

WATCH, a period of four hours on board ship, during which the same set of men are on duty. The crew being divided into two or three sets, also called *watches*, take turn and turn about. But to prevent the same watch always falling to the same men, the period from 4 to 8 p.m. is subdivided into two *dog-watches* of two hours

each, which are taken in turn with the others.

WATER. See *Med. Dict.*

WATERBURY, a town in Connecticut, U.S.A. It is celebrated for its brass works, nearly £3,000,000 worth being turned out in the year. But it gave its name to one of the earliest forms of the cheap modern watch, which was here manufactured; population 51,000.

WATER-CLOCK. See *Clepsydra.*

WATER COLOURS, pigments intended to be laid on through the medium of water, and not oil. The quickness of drying is one great advantage over oil. Water-colour painting, though the more ancient of the two, was long practised as an auxiliary to, or preparation for oil-painting, but since Turner showed the possibilities of water-colours, this branch of art has grown more and more into recognition.

WATERFORD, a town in the south of Ireland, county town of Waterford county. It has a fine situation at the point where the river Suir flows into Waterford Harbour. It sends large quantities of agricultural produce to England, comprising bacon, butter, eggs, cattle, and pigs; population 28,000.

WATERLOO, BATTLE OF, fought on June 18th, 1815, practically ended the career of Napoleon. Wellington, determined to keep the French from Brussels, had chosen his ground and made sure of assistance from Blucher. The forces on each side were about equal in number, the French numbering 72,000, the allied British, Dutch, and Germans 67,000, of whom 23,000 were British. The battle consisted of heavy charges on the British lines, preceded by severe cannonading. Confident of receiving support some time or other from Blucher, Wellington bore it patiently until the Prussians appeared. Then, having repelled Napoleon's grand attack by the Old Guard, he ordered the advance, and Napoleon's hopes were crushed. The allies had 22,000 killed and wounded, the French 35,000.

WATERLOO BRIDGE, across the Thames, joining Wellington Street to Waterloo Road, is one of Rennie's masterpieces. It is of granite, 2,456 feet long with the approaches, it is level from end to end, and crosses the river by nine arches, each of 120 feet span. It was opened June 18th, 1817.

WATERPROOF. The commonest and most effective way of rendering cloth waterproof is to cover it with a solution of indiarubber. This method was patented by Charles Macintosh of Glasgow. The indiarubber is dissolved in naphtha and laid on so thin that five or six coats hardly amount to one hundredth of an inch in thickness. Other methods are to steep the cloth in various solutions which render it impervious to water, but not to air.

WATER-SPOUTS are due to whirlwinds which occur over the sea. The resulting column of water is sometimes carried over the land, and there discharged, but usually the system disperses in a short time. The rotary motion of the whirlwind acting on a cloud draws it downward in the shape of an inverted cone, and at the same time draws the water up from the sea. Eventually the column of water thus formed bursts, sometimes doing considerable damage.

WATLING STREET, a street in London running from St. Paul's to Cannon Street. It is a part of the great Roman road of that name which ran from Dover to Chester by way of Canterbury, Rochester, London, and Bedford.

WATSON, JOHN, *b.* at Manningtree, Essex, 1850, better known to the world at large by his *nom de plume* of Ian Maclaren, was for 25 years minister of Sefton Park Presbyterian Church, Liverpool. Educated at Glasgow University, and at Tübingen, in Germany, he served as a minister in Scotland before being called to exercise his ministry at Liverpool. His liberality of view at one time involved him in controversy. His best known works are "Beside the Bonnie Brier Bush," and "The Days of Auld Lang Syne."

WATSON, WILLIAM, *b.* at Wharfedale, 1858, but brought up in Liverpool, where his father was a merchant. He early began to produce poetry, but hardly obtained recognition till his "Wordsworth's Grave" was published with other poems, in 1890. "The Year of Shame" and the "Purple East" voiced in 1896 the feelings of those who felt the horror of the Turkish proceedings.

WATT, JAMES, *b.* at Greenock, 1736, *d.* 1819, was the originator of the modern steam-engine, for his invention of the separate condenser, together with other improvements, made an era in its history, and at once increased its efficiency about four fold. His early training as mathematical instrument maker to the University of Glasgow stood him in good stead when, perceiving the weak points in Newcomen's engine, he set himself to improve it. With his partner Boulton, he carried on a successful business at the Soho iron-works, Birmingham.

WATTEAU, JEAN ANTOINE, *b.* 1684, *d.* 1721, the painter of that imaginary rural felicity so popular with the court of Louis XIV. Born of poor parents, his life was a struggle till the last few years, when his merits gained him admission to the French Academy. His pictures will always be esteemed for their beautiful colouring and gracefulness of outline, despite the artificiality of the subjects.

WATTS, GEORGE FREDERICK, *b.* in London, 1820, *d.* 1904, an eminent painter and sculptor, whose work is chiefly remarkable for its serious symbolical teaching. He exhibited at the Academy in 1837, and then his life was one steady success. He was a great portrait painter, and his work in sculpture is marked by boldness and grace. He was twice offered a baronetcy.

WATTS, ISAAC, *b.* 1674, *d.* 1748, a Nonconformist minister, will best be remembered for his hymns, some of which are among the best loved in the English language. His intense devotion to study in early life injured his constitution, and he lived the last half of his life in semi-retirement at Theobald's. "Jesus shall reign where'er the sun," "When I survey the wondrous Cross," and "O God, our help in ages past," are by Watts.

WAUGH, EDWIN, *b.* at Rochdale, 1817, *d.* 1890; the Lancashire poet and writer of short stories and sketches, was entirely self-educated, having to begin work at twelve. After working in various places as a journeyman printer, he settled down in Manchester. In 1885 he published "Sketches of Lancashire Life," and thereafter he had no difficulty in gaining a hearing. His songs and stories in the Lancashire dialect are highly esteemed.

WAVERLEY, the first of the famous series of novels written by Sir Walter Scott was produced in 1814. The secret of its authorship was well kept for years, and though many felt sure that none but Scott could be the author, not till the crash in his financial affairs, 1826, was the authorship made public. The book gives a fine picture of the hopes and fears that animated parties in 1745. Its name is taken from Waverley, near Hindhead, in Surrey.

WAVRE, a town in Belgium, 15 miles south-east of Brussels, the scene of a battle between the French and the Prussians, June 18th, 1815. Napoleon had defeated Blucher at Ligny on the 16th, and on the 17th he sent Grouchy with 33,000 men to follow them while he attacked the English. But Blucher had already started to join Wellington, and his rear-guard managed to keep Grouchy from returning to aid Napoleon; population 8,000.

WAX, a fatty solid derived both from animals and vegetables. It differs from fat proper in containing no glycerine. It is insoluble in water, and only slightly soluble in alcohol. Its chief uses are to make candles, to polish floors, for modelling, and to serve the chemist as the foundation of many ointments. Sealing-wax is not a true wax.

WAYLAND SMITH, a character in Scott's "Kenilworth." He dwelt in a cave among the hills in Berkshire, and shod travellers' horses for sixpence. The cave is still shown, near the White Horse. The original "Weland" was a mythical horse smith who forged Beowulf's armour.

WEALD (the same as the German *wald*, a forest), the name of a large district between the North and South Downs, stretching from Farnham and Petersfield on the west to the sea on the east. It was once a large forest, of which parts remain here and there, and make the weald one of the most picturesque parts of England.

WEALTH OF NATIONS, a book by Adam Smith (1723-1790), a philosopher, professor, and lecturer of Glasgow and Edinburgh. In this work, which has had a world-wide influence, he points out that labour is the true wealth of a nation, and proceeds to examine what are the conditions under which labour can be most profitably employed. The book has passed through innumerable editions.

WEASEL, a small animal allied to the marten, polecat, mink, and stoat, common in the temperate and cold parts of the Northern Hemisphere. It is about 10 or 11 inches long, brown in colour with white breast. In extreme cold it becomes white all over. It feeds on rats, mice, moles, frogs, etc., and occasionally devours rabbits and birds.

WEAVER BIRD, a small bird of which there are many species in Africa, Asia, and Australia, none in Europe or America. They derive their name from weaving together flexible materials, such as grass, etc., to form a nest, and they make these materials adhere more closely with saliva. The Sociable Weaver-bird of South Africa constructs a roof or shelter, under which hundreds of nests may be found.

WEAVING, the art of producing cloth by the intersection of two sets of fibres at right angles to one another, those which go longitudinally from end to end being called the warp, and those at right angles to these being called the weft or woof. Weaving has been practised from the earliest times, but the aid of machinery dates only from 1733, when John Kay, of Bury, invented the fly-shuttle, which saved the weaver touching the shuttle with his hands. Then, in 1785, Edmund Cartwright invented the power-loom. This relieved the weaver from the task of moving the shuttle backwards and forwards, and of moving the threads up by means of the "reed." In 1801, Joseph Jacquard, a Frenchman, invented a form of loom which much simplified the work of weaving the patterns.

WEBER, KARL, BARON VON, *b.* 1786, *d.* 1826, an eminent German musician, many of whose works are still produced at intervals. "Der Freischutz," "Euryanthe," and "Oberon," retain their popularity, while some of the music in

"Preciosa" is very beautiful. His piano piece, "Concertstück," is well known, and his other compositions are numerous.

WEBSTER, DANIEL, *b.* in New Hampshire, U.S.A., 1782, *d.* 1852, a celebrated statesman, orator, and jurist. Educated as a lawyer, he soon entered Congress, and won fame both at the bar and in the Assembly. He more than once averted war with Britain, and was mainly instrumental in negotiating the famous Ashburton Treaty, which made Canada secure. On the slavery question he was unable to side with the Northerners, a fact which lessened his influence.

WEBSTER, NOAH, *b.* at Hartford, Connecticut, 1758, *d.* 1843; the author of the well-known dictionary, was at different times a lawyer, a journalist, and a schoolmaster. But his heart was in the study of English, and his "Grammatical Institute" long enabled him to follow his bent. His great dictionary took him years to prepare, and it is still an authority on the English tongue.

WEBSTER, RICHARD EVERARD. See *Alverstone*.

WEDGWOOD, JOSIAH, *b.* 1730, *d.* 1795, the founder of art pottery in England, was a native of Burslem, in Staffordshire. His skill in moulding soon brought him custom when he set up for himself, and tried to produce something better than the coarse ware he saw made around him. Before long he aimed at equalling the old classical vases, and engaged capable artists to produce designs. The Etruria pottery, near Burslem, was established by him, and here the bulk of the celebrated "Wedgwood" ware has been produced.

WEDMORE, a village in Somersetshire, 8 miles from Wells. Here Alfred made peace with Guthrum the Dane, on condition that Guthrum should be baptized and should limit his rule to England north and east of Watling Street.

WEEK. The existence of the week, as we know it, is bound up with the recurrence of the rest-day, Sunday or Sabbath. It is, of course, well known that the use of a cycle of seven days, ending with a rest-day, was strictly observed among the Jews. It is equally clear that the same practice prevailed in Egypt, but when the Egyptians adopted it is uncertain. The adoption by the Romans of this seven-day cycle, as recorded by Dion Cassius, providentially preceded the spread of Christianity, and thus saved Christians from one source of trouble.

WEI-HAI-WEI, a small harbour, with adjacent territory some 100 square miles in extent, on the southern shore of the strait of Pe-chi-li, taken in lease by the English from China in 1898.

WEIMAR, the capital of a small German duchy, is situated on the river Ilm, 50 miles south-west of Leipsic. Its great interest lies in the fact that Goethe lived here from 1782 till his death, in 1832, and here produced the greater part of his works. Here also Schiller passed his last few years; population about 30,000.

WELBECK ABBEY, now the seat of the Duke of Portland, is near Worksop, in Nottinghamshire. It is a handsome building, much enlarged, 1860-70, by the then duke, who spent enormous sums on his underground picture-gallery, riding-school, and ballroom.

WELLESLEY, MARQUIS OF, *b.* 1760, *d.* 1842, the elder brother of the great Duke of Wellington, was son of the Earl of Mornington. Educated at Eton and Oxford, he entered the English Parliament at the age of twenty-four. He gained the favour both of George III. and the ministry, and in 1797 went out to India as Governor-General. His talent for administration, with his brother Arthur's military genius, well maintained the British predominance despite the efforts of the French and Tippoo Saib. Returning from India, he was twice made Lord-Lieutenant of Ireland.

WELLHAUSEN, JULIUS, *b.* 1844, a famous Oriental scholar and Old Testament critic; was educated at Göttingen University. He resigned the professorship of theology at Greifswald from conscientious reasons, and became professor of Oriental languages at Göttingen. His criticisms and comments on the books of the Old Testament, and especially their date and authorship, have given rise to much controversy.

WELLINGTON, made from its central situation the seat of government of New Zealand. It stands on Port Nicholson, a branch of Cook Strait. It has a commodious harbour, capable of taking vessels of any size. Having regard to the frequent earthquakes, the town is mainly built of wood. Its importance is rapidly increasing, both as a manufacturing town and as a port; population 50,000.

WELLINGTON, (Arthur Wellesley), **DUKE OF,** *b.* at Dublin, 1769, *d.* 1852, third son of the Earl of Mornington, materially helped to save Europe from French domination. As a youth he was not brilliant, but in the army he soon asserted himself as a capable commander. From 1797 to 1805 he served in India, first under General Harris, and then in chief command. In 1808 he headed an expedition against the French in Portugal, but was soon superseded. In 1809 he again took command, and never again left the Peninsula till he crossed the Pyrenees in 1814, driving the French before him. The lines of Torres Vedras, a series of works stretching from a point on the river Tagus to the sea, arrested the progress of the French, and kept his base secure at Lisbon. Called to command the allied army against Napoleon after the return from Elba, he concerted with Blücher a plan of operations for their common safety in any event, and then prepared for his first and last battle with Napoleon at Waterloo. His life subsequent to the Napoleonic War is a long chapter of English history. For thirty-six years he was one of the guiding hands in English affairs, and though he made some mistakes he redeemed them by his honesty of purpose. All Europe mourned his loss when he died, and his funeral at St. Paul's was attended by representatives from nearly every country.

WELLINGTON COLLEGE, 4 miles from Wokingham, in Berkshire, was opened by Queen Victoria in 1859. It was founded by public subscription as a memorial to the Great Duke, for the education of the sons of officers in the army. There are about 400 pupils, 100 of whom hold scholarships and pay £10 a year, while the rest pay from £95 to £110.

WELLS, a pleasant city in Somersetshire, 20 miles south-west of Bath, at the foot of the Mendip Hills. The cathedral will bear comparison with any for beauty; the celebrated west front, with its host of figures, being unsurpassed. The bishopric has the dual title of "Bath and Wells," but Wells is the seat of office; population 4,900.

WELSBACH LIGHT, a light produced by gas burnt with air in a Bunsen burner, the flame of which impinges on a covering or "mantle" made of incombustible substances (See *Incandescent Light*).

WENHAM LAKE, a lake about a mile square, near Boston, U.S.A. It is celebrated for the purity of its ice, the harvesting of which is a winter sight. A good deal of Wenham Lake ice used to come to England, but we now draw almost all our foreign supply from Norway.

WENTWORTH, THOMAS. See *Strafford, Earl of*.

WEREGILD, or **WERGILD** (A.S. *wer* "man" and *gild* "compensation"), a payment customary among Anglo-Saxon and other Teutonic tribes in expiation of homicide or other serious offence against the person. The amount varied with the condition of both the aggressor and the person injured, but once paid the offender was secure from further penalty.

WESLEY, CHARLES, *b.* 1708, *d.* 1788, brother of the great John Wesley, did much good work as assistant to his brother in the great "revival." Not fitted physically to undergo the unceasing labours his brother undertook, Charles worked zealously as far as his powers went. As a poet and hymn writer he excelled. "Jesu, Lover of my soul," "Rejoice, the Lord is King," are two of the most popular of the 5,000 hymns from his pen.

WESLEY, JOHN, *b.* 1703, *d.* 1791, founder of the great Wesleyan Church, was son of Samuel Wesley, rector of Epworth, in Lincolnshire. From Charterhouse School he proceeded to Christ Church, Oxford, where he soon attracted notice by the extraordinary strictness of his life. From his ordination in 1725 until 1735 he was a zealous member of the Church of England, but undertaking a mission to Georgia in that year, he fell in with some Moravians, by whose system he was captivated for a time. In 1738 he began his work as a revivalist preacher. The rest of his life was taken up with travel and preaching, interspersed with literary work. The Wesleyan Church is a testimony to his marvellous powers of organisation.

WESLEYANS. Refer to *Index*.

WESSEX, the kingdom of the West Saxons, founded early in the 6th century, comprised the counties of Hampshire, Dorset, Wiltshire, and Somerset, with adjacent districts. It had varying fortune until the time of Ina (688-726), after whose days Wessex became more and more powerful until the reign of Egbert, who in 827 was acknowledged overlord by Mercia and the other kingdoms. Another century, however, had to pass before a king of Wessex could truly style himself "King of England."

WEST, BENJAMIN, *b.* at Springfield, Pennsylvania, 1738, *d.* in London, 1820, an historical painter of some eminence. Born of poor parents, he had practically no teaching until, in 1760, some generous friends sent him to study in Italy. Thence he came to London, where he soon made a reputation. His "Death of General Wolfe" attracted much attention in his day. For twenty-eight years he was President of the Royal Academy. He lies in Westminster Abbey.

WEST AUSTRALIA, the western portion of the Australian continent, has an area of over 1,000,000 square miles, or about twenty times that of England. The eastern half of this Colony is almost one great desert, scarcely explored; but the western and northern districts are partially settled. Gold was found in the Kimberley district in 1882, but the great rush to Western Australia was in 1893, after the discovery of the Coolgardie and neighbouring goldfields. The supply of useful timber in the colony is immense. Refer to "West Australia" in *Index*.

WESTCOTT, BROOKE FOSS, *b.* near Birmingham, 1825, *d.* 1901, a great scholar and theologian, was educated at King Edward's School, Birmingham, and at Cambridge, where he had a most dis-

tinguished career. He was for some years a master at Harrow School, afterwards professor of divinity at Cambridge, then Bishop of Durham. His lectures and works on the New Testament are much esteemed, and he took a leading part in the last revision of the Bible.

WESTERN EMPIRE, THE, When the Emperor Theodosius died, in 395 A.D., the Roman Empire was divided between his two sons, Honorius taking the western provinces, comprising Italy, Gaul, Britain, Spain, Africa, and Illyricum, and Arcadius the eastern, with Constantinople as his capital. The new Western Empire was soon shaken by Alaric the Goth, and in less than 100 years it was dissolved.

WEST INDIES, THE, a large and important group of islands lying between North and South America, and separating the Gulf of Mexico and the Caribbean Sea from the Atlantic. The largest of the islands are Cuba and Porto Rico, lately ceded to the United States; Hayti, divided into two negro republics; and Jamaica, a British colony. Of the smaller islands, a good many are British, while others belong to France, Holland, or Denmark. Nearly the whole archipelago lies within the tropics. The principal productions are sugar, tobacco, coffee, and bananas. Refer to "West Indian Possessions" in *Index*.

WESTMACOTT, SIR RICHARD, *b.* in London, 1775, *d.* 1856, an eminent sculptor, received part of his training in Rome from the great Canova. Many of the monuments in Westminster Abbey and St. Paul's are by him, and also the "Achilles" in Hyde Park.

WESTMINSTER, a city now forming part of the great county of London, while retaining many important privileges of self-government, was once a separate city, whose boundaries reached the city of London at Temple Bar. Within it are situated Westminster Abbey, the Houses of Parliament, Westminster Hall, and most of the Government Offices in palatial buildings. Near the Abbey is Westminster School, where many eminent Englishmen were educated.

WESTMINSTER ABBEY, the resting-place of many of England's famous men, stands on what was the island of Thorney, in early times. The early Saxon Church was rebuilt by Edward the Confessor, and finished just in time for William the Conqueror's coronation. The present building dates from 1269, and was finished in 1735. Thirteen kings, and many of our queens, are buried here, as well as numerous poets, statesmen, and warriors. Nearly all our monarchs have been crowned here, and here is the ancient coronation stone of Scotland. The Dean of Westminster holds a unique position among church dignitaries, the office conferring many privileges and allowing considerable independence of action and opinion.

WESTMINSTER ASSEMBLY, an assembly of learned and pious men called in 1643 to consider the question of Church doctrine and government. As Charles I. had forbidden the holding of such an assembly, the Church of England was practically unrepresented, but the Presbyterians drew up statements of doctrine and directions for worship that still hold good in the Church of Scotland. The chief results of their labours were the "Directory of Public Worship," the "Confession of Faith," and the "Shorter" and "Larger" Catechisms.

WESTPHALIA, THE KINGDOM OF, was formed by Napoleon in 1807 for his brother Jerome. It consisted of the present Westphalia, with parts of Hesse, Hanover, Brunswick, and Saxony. After the Battle of Leipzig, in 1813, the kingdom was dissolved, and its constituent parts reverted to their previous owners.

WEST POINT, the site of the United States Military Academy, is situated about 50 miles north of New York. Standing high above the Hudson, it commands a view of most picturesque scenery.

WEYMAN, STANLEY JOHN, an historical novelist, was born in 1855. Educated at Shrewsbury School and Oxford University, he started life as a barrister. In 1889 he published "The House of the Wolf," and followed it by others, until, in 1893, he achieved a great success with his "Gentleman of France." "The Red Cockade," "Under the Red Robe" and the "Abbess of Vlaye," among his other works, show his skill in writing historical romance.

WHALE. See *Cetacea*.

WHALEBONE, or **BALEEN,** a horny substance found hanging in thin parallel plates from the roof of a whale's mouth. There are about 300 or 400 all round the mouth, and when the whale closes its mouth after holding it open some time, the baleen plates act as a sieve to retain the fishes and other food while the water strains out.

WHATELY RICHARD, *b.* in London, 1787, *d.* 1863, son of a distinguished English Churchman, became Archbishop of Dublin, and did great service to the Church of England and religion generally by his dialectic skill and readiness to meet sceptics in argument. He had a distinguished career at Oxford, where he was some years tutor before becoming Archbishop. Besides his theological works, he was the author of treatises on Logic and Rhetoric, which went through many editions.

WHEAT, the most important vegetable product of temperate and sub-tropical regions, has been cultivated from the earliest ages of civilization. It is a hardy plant, but is not cultivated so far north as barley and rye. The history of wheat cultivation in England is interesting; few people would believe that less than 200 years ago the poor never tasted wheaten bread. Rye bread is still a common food of the working-classes on the continent. The spread of wheat cultivation during the last century has had many important effects, one being that the industry has much declined in England, and land values in consequence have decreased. We now only grow about one-fourth of our supply, the rest coming from the United States, Canada, India, Russia, and Argentina.

WHEATSTONE, SIR CHARLES, *b.* at Gloucester, 1802, *d.* 1875, one of our greatest scientists, and the pioneer in England of electric telegraphy. He was intended for business, but his talent for inventing scientific instruments brought him to the notice of scientists. He made many original experiments in Sound and Light as well as in Electricity, and received recognition from most of the European scientific bodies.

WHEEL, BREAKING ON THE, a mode of punishment formerly used in Continental countries, and not unknown in Britain. The criminal was attached to a large wheel, his legs and arms tied to the spokes, and the bones of his legs and arms were broken as the wheel turned round.

WHEWELL, WILLIAM, *b.* at Lancaster, 1794, *d.* 1866, a great mathematician, scientist, and teacher in the first half of the 19th century. He had a distinguished career at Cambridge, where he became fellow, tutor, and finally Master of Trinity College. His text-books on mathematics and physics had a great vogue in their day, and he wrote besides many treatises on physical science and philosophy.

WHIGS, the name given in derision to the adherents of the popular party in Stuart times, soon became the common title for those who upheld the popular cause. It came from Scotland, being used there to denote the Covenanters who defied the law. It is now supplanted by the term "Liberal."

WHIRLPOOL, a circular rush of water caused by two currents or tides meeting, or by a strong wind opposing a current. The Maelstrom and Charybdis occasionally present striking examples of this effect, but only under special circumstances. As a rule there is no danger in navigating near them in calm weather.

WHIRLWIND, a circular rush of air produced by two opposing winds meeting. It rarely lasts long, a few seconds, or a minute at the outside, but its effects are often most disastrous. It travels along with more or less rapidity, tearing up and carrying to a considerable distance quite heavy objects, such as roofs and hayricks, and levelling trees and barns. At sea whirlwinds often cause waterspouts.

WHISKY, a spirit obtained by distillation from barley and other grains, and even from potatoes and other plants. The best is that obtained from barley, and in the production of this Scotland is justly famous. Pure whisky is quite colourless and transparent, the golden colour being produced by various additions. Whisky is improved by being stored in wine casks, those which have contained sherry being the most suitable. Illicit distillation is still carried on in remote districts in Ireland, but is now rare in Scotland, and almost unknown in England.

WHISTLER, JAS. ABBOTT McNEILL, *b.* 1834, *d.* 1903, artist, was a native of Lowell, Mass., U.S.A. Coming to Paris and to London, he did much work in both places, exhibiting in the Salon, the Academy, and other galleries. His etchings are probably unsurpassed, while as a painter he excels in originality of colour effect and in portraiture. His celebrated "Gentle Art of Making Enemies," was a literary excursion that will perpetuate his strange, quarrelsome disposition.

WHITBY, a seaport and watering-place in the north-east of Yorkshire. Standing amongst the bold cliffs that mark this coast, it is fast becoming a popular place of resort. The jet manufacture is decaying and that of alum almost extinct, but fishing still flourishes. The ruins of the ancient abbey are well worth visiting.

WHITE, GILBERT, *b.* 1720, at Selborne, Hants., *d.* 1793, a distinguished naturalist. He had a brilliant career at Oxford. His taste, however, was for the quiet life of a country parish; and in various places, but lastly at Selborne, he ministered as curate. His great work, the "Natural History of Selborne," appeared in 1789, four years before his death.

WHITE, HENRY KIRKE, *b,* 1785, *d.* 1806, was the son of a butcher of Nottingham. A volume of promising poems published by him in 1803 gained the notice of Southey, who, with others, aided him to go to Cambridge University. Here his severe studies, acting on a feeble constitution, undermined his health, and he died young.

WHITEBAIT, a small fish, probably the young of herrings or sprat, caught in the Thames and a few other places in early summer. It is about 2 to 4 inches in length, and when cooked soon after being caught, has a most delicate, and at the same time distinctive, flavour. The "Ministerial Whitebait Dinner," at

Greenwich, used to be a feature of every session of Parliament.

WHITEBOYS, the name of one of the numerous secret associations that flourished in Ireland during the first half of the 19th century, and even later. Enraged by their political and agrarian grievances, the Irish peasants committed many outrages on those who were on the side of law and order, and the authors could seldom be detected.

WHITEFIELD, GEORGE, *b.* 1714, *d.* 1770, the contemporary, and, for some years, the co-worker with the Wesleys, was the son of an inn-keeper of Gloucester. Obtaining a servitorship at Pembroke College, Oxford, he went there just when the Methodist movement was in its third year. He joined heartily in it, and travelled about preaching as much as John Wesley. Ejected from the Church of England, he had not even the consolation of agreeing in doctrine with Wesley, from whom he seceded in 1741, to form what is commonly known as the "Countess of Huntingdon's Connexion." His teaching was distinctly Calvinistic.

WHITEHALL, a district lying between Trafalgar Square and the Houses of Parliament, in which are situated the Home Office, the Admiralty, the new War Office, the Horse Guards, the Colonial Office, and the India Office. It takes its name from the old palace, which was the favourite residence of the Tudors and Stuarts. That palace, which passed from Wolsey to Henry VIII., was destroyed by fire, except the Banqueting Hall, in 1697. The window of this Banqueting Hall is still shown from which Charles I. stepped to his execution. The Hall itself is now the United Service Museum.

WHITEHEAD, ROBERT, *b.* at Bolton, Lancashire, 1823, *d.* 1905, engineer and inventor. His first torpedo was finished in 1866, at Fiume, and his invention was adopted by the Austrian Government, 1868, and three years later by the British Admiralty. It is now with various modifications in all navies. See *Torpedo.*

WHITE HOUSE, THE. See *Washington (city).*

WHITE SEA, THE, a large gulf in the north of Russia, opening into the Arctic Ocean. It has an area of nearly 50,000 square miles, almost as large as England without Wales. At its south-eastern corner stands Archangel, at the mouth of the Dwina, long the only port of Russia and through which trade commenced with England in Elizabeth's reign. The harbour is frozen over from September to May, and is not now important.

WHITE TOWER, THE, the largest and most important of the buildings comprised in the Tower of London. It was built about 1078 for William I., strengthened and added to by various sovereigns, and used both as a palace and as a state prison till the later Stuart times. A menagerie existed here from 1235 to 1831, when the animals were removed to the Zoological Gardens. It contains a fine collection of armour.

WHITE LEAD, a carbonate of lead, known also as ceruse, much used as a pigment and in glazes. It occurs naturally, but the greater part is made by a most interesting process from the metal. White lead is often adulterated with chalk and other substances, which diminish its brilliance but add to its lasting qualities.

WHITMAN, WALT, *b.* 1819, *d.* 1892, the most characteristic and original of American poets, had little formal education. Till the publication of his "Leaves of Grass" in 1855, he flitted from one employment to another, not for the sake of gain, but of knowledge. The great American War saw him spending all his strength and energy in tending the wounded heroes of the North, after which he produced many volumes of verse. His style, opinions, and choice of subjects have often given offence.

WHITNEY, ELI, *b.* in Massachusetts, 1765, *d.* 1825; the inventor of the cotton-gin; was a teacher in Georgia when the difficulty of separating the cotton from the seeds caused him to invent the saw-gin, which does the work rapidly. He made little money out of this invention, but he got a patent for manufacturing firearms, which proved profitable.

WHITTIER, JOHN GREENLEAF, *b.* 1807, *d.* 1892, an American poet, was as devoid of ordinary education as Whitman. But a natural love of poetry made him early master of all the best known poets, and his own genius soon supplied him with subjects for his pen. The subject of Abolition then loomed large on the American horizon, and Whittier devoted himself to helping it forward. Thus it is that many of his poems, admirable in their day, are now out of date and devoid of interest. But enough remain to show that Whittier had the true poetic inspiration, although less polished in his expression than some others. Of his longer poems, "Snowbound" is the most popular, while "The Eternal Goodness," "The Two Angels," and "Invocation," are perhaps the best of the shorter ones.

WHITTINGTON, SIR RICHARD, son of Sir William de Whittington, of Pauntley, in Gloucestershire, was resident in London in 1379, when he subscribed to a city loan. He was thrice Lord Mayor of London, he restored St. Bartholomew's Hospital, and until his death, in 1432, he took a leading part in London affairs, and was knighted by Henry V. for his financial services. The part of his story relating to the "Cat," probably took its origin from his possessing a ship of that name.

WHITWORTH, SIR JOSEPH, *b.* at Stockport, 1803, *d.* 1887, one of the men combining inventive genius with business capacity who have been the making of England as a manufacturing country. His discovery of the method of producing true planes, and other devices for obtaining exactness in machines and tools, revolutionised the engineering industry. His experiments largely paved the way for improvements in the modern rifle. He became especially famous for his breech-loading guns. A great part of the enormous fortune he amassed was left for benevolent purposes, and about £100,000 of this was devoted to establishing scholarships for young engineers.

WHYMPER, EDWARD, *b.* in London, 1840, a great mountain climber and explorer. His early training in the art of wood engraving has aided him greatly in producing the fascinating books that tell of his ascents and explorations. He was the first to climb the Matterhorn, as well as several other Alpine summits. He has also contributed largely to the exploration of Northern Greenland and of the Andes. "Scrambles among the Alps," and "Travels among the Great Andes," are his chief works.

WICLIF. See *Wyclif.*

WICK, a busy little town almost in the extreme north-east of Scotland. It stands on a convenient little bay, from which hundreds of boats go out to the herring fishing, which is the main support of its population of about 9,000. It is the county town of Caithness.

WIELICZKA, a small town in the Austrian province of Galicia, 8 miles from Cracow. Here is one of the most important and productive salt-mines in the world. For centuries the mines have been working, and a visit to its galleries is one of the sights comprised in a tour of Austria. The annual output of salt is about 50,000 tons; population 6,000.

WIESBADEN, a handsome town of Germany, 5 miles north of Mainz, and 20 west of Frankfort. It is one of the most important watering-places in Europe, many thousands going there annually to visit its hot springs, the largest of which has a temperature of nearly 160° F., and sends out enormous volumes of water. The town has much to attract visitors, and there are interesting Roman remains to be seen; population 86,000.

WIG. The history of wigs takes us back to very ancient times. They were worn by the Egyptians and Assyrians as well as by the Greeks and Romans. In the 16th century they became common among the ladies of Europe, and in the next reign men began widely to adopt them, headed by Louis XIII. and Louis XIV. of France. Their use began to die out in the 19th century, and now they are rarely used except by judges, lawyers, and the Speaker of the House of Commons.

WIGHT, ISLE OF. See *Isle of Wight.*

WIGWAM, the name given by the American Indians to their tents of bark or skins. Stakes are placed in a circle in the ground, and bent over so that their ends cross near the top, at which point they are fastened together. The bark or skin covering is then laid on so as to leave a hole at the top for smoke to escape.

WILBERFORCE, SAMUEL, *b.* at Clapham, 1805, *d.* 1873, was a son of William Wilberforce, one of the leaders in the great anti-slave-trade movement in England. Brought up with more than usual care by a pious father, he distinguished himself in his college career at Oxford. Entering the Church, he rose to be Bishop of Oxford just when the difficulties stirred up by the Tractarian movement were at their height. The example he set as a working bishop, and the influence he exercised by his eloquent tongue had a great effect upon the men of his time. For the last four years of his life he was Bishop of Winchester. He was killed on the spot by a fall from his horse.

WILBERFORCE, WILLIAM, *b.* 1759, *d.* 1833, the great champion of the anti-slave-trade movement, was the son of a wealthy merchant of Hull. Early in life he conceived a detestation of the slave-trade with its attendant evils, and the possession of a large fortune enabled him to devote his time and energy to its abolition. Thomas Clarkson, Granville Sharp, and the Quakers generally, gave him efficient assistance, and in 1807 he had the satisfaction of seeing a law passed to stop the odious traffic. He took a deep interest in the abolition of slavery itself, but died just before the Bill was passed. He lies in Westminster Abbey.

WILD BOAR, a species of pig widely distributed in the Old World, and once common in Britain. It is a large fierce creature, 4 or 5 feet in length, haunting the recesses of the forests, and damp places generally. It lives on vegetable produce, doing great harm to the crops and young trees. In India, boar-hunting ("pig-sticking") is a favourite amusement with the English officers. The boar's head used to be a favourite dish at ceremonial banquets.

WILDEBEEST. See *Gnu.*

WILHELMINA, Queen of Holland, is the daughter of William III. of Holland, whom she succeeded on the throne. Her father, whose sole surviving child she was, died in 1890, when she was but ten years of age, and till 1898 the kingdom was under the regency of the queen-mother,

and many interesting stories are told of the devotion and firmness she showed in that trying capacity. In 1901, Queen Wilhelmina married Henry, Duke of Mecklenburg.

WILHELMSHAVEN, the second naval station of Germany, is on the Gulf called the Jahde, just west of the mouth of the Weser. Founded by King William I. (whence its name), in 1869, it has basins, docks, and workshops, as well as nautical and engineering schools, all constructed at vast expense, out of the indemnity exacted from France, 1871; population 22,000.

WILKES, JOHN, *b.* 1727, *d.* 1797, a writer and politician, by whose resolute conduct the freedom of the Press was established. For an article in his paper, the "North Briton," reflecting on the government, he was arrested in 1763 on a general warrant. But asserting that such warrants were illegal he refused to plead, and Lord Chief Justice Pratt ordered his release. He was afterwards outlawed for printing an indecent poem, but his outlawry was subsequently reversed, and the resolutions that expelled him from the House of Commons rescinded. It is a pity that his private life does him less credit than his public services.

WILKIE, SIR DAVID, *b.* 1785, in Fifeshire, *d.* 1841, was the son of a Scottish minister. He studied his art in Edinburgh, but soon proceeded to London, where he scored a great success in the Academy Exhibition of 1806 with his "Village Politicians." From this time he produced that succession of homely pictures, the "Card Players," etc., which lead up to his masterpiece, the "Chelsea Pensioners." His later efforts were of a more ambitious kind, but do not add to his reputation. He died at sea, in returning from a tour in Palestine and the East.

WILLIAM I., King of England (1066-87) surnamed the Conqueror, was the son of Robert III. of Normandy and a tanner's daughter. On the death of his father he succeeded to the duchy, and in 1066 invaded England, to seize the crown from Harold, who had been elected king by the Witenagemote. Aided a good deal by fortune, William won the battle of Hastings, and Harold's death relieved him from further serious opposition. He was crowned at Westminster on Christmas Day, 1066. After putting down a series of rebellions, he ruled England with great firmness and political wisdom.

WILLIAM II., of England (1087 1100), second son of the Conqueror, had no easy task to secure the crown his father had left him. He had to appeal to the English for help ere he could crush the resistance of the Norman barons, who knew his masterful character. William, with all his vices, was a brave warrior, prompt and rapid in action. He conquered Cumberland from the Scots, and made himself lord over a great part of Wales. He was accidentally shot dead whilst hunting in the New Forest.

WILLIAM III., King of England (1689-1702), Prince of Orange in Holland, was nephew and son-in-law of James II., whom he succeeded. He came to England in 1688, with a force of 13,000 to deliver England from the tyranny of her king, James II. Inscribed on the flag of William's ships were the words, "The Protestant Religion and the Liberties of England." On the flight of James, the crown was conferred on William and Mary his wife, jointly. After establishing his authority in Scotland and Ireland, he made use of his new power to curb the ambition of Louis XIV. His death, at the age of 52, was the result of an accident while riding in Hampton Court Park, 1702.

WILLIAM IV., King of England (1830-1837), the "sailor king," was the third son of George III. He served for some years in the navy, but after attaining the rank of captain was never again afloat. His reign saw some most important measures passed, the Reform Act in 1832, and the Acts for abolishing slavery in our colonies (1833), for reform of the Poor Laws (1834), and for Municipal Reform (1835). In his reign also was laid the foundation of our railway system. He died at Windsor after having shown serious signs of lapsing into insanity.

WILLIAM I., seventh king of Prussia, and first German Emperor, *b.* 1797, *d.* 1888. He saw and took part in more stirring events than almost any man of his time. He had an active share in the last campaigns against Bonaparte, and took a great part in quelling the revolutionary movement of 1848-9 in Prussia. In 1861 he became king of Prussia, and immediately set himself to consolidate his power. His successes against Denmark in 1864, Austria in 1866, and in the great Franco-Prussian War of 1870-71, placed him on a pinnacle of popularity that culminated in his being offered, and accepting, the crown as German Emperor. Prince Bismarck, who had aided him in his schemes, received the fitting reward of his services, and continued to be his principal adviser until his death.

WILLIAM II., *b.* 1859, ninth king of Prussia, and third German Emperor, is the son of the Emperor Frederick and Princess Victoria of England. Coming to the throne in 1888, after the short reign of his father, he soon showed his intention to rule as well as reign. The dismissal of Bismarck was a sign of the new era. In everything he proclaims the doctrine that he is the embodiment of the State, and as such his will must be obeyed. His determination to make Germany a naval power, and to promote colonial expansion are well known. He is a born ruler of men, with great natural gifts, including that of oratory.

WILLIAM THE SILENT, *b.* 1533, *d.* 1584, Count of Nassau and Prince of Orange, gained his nickname by the taciturnity he maintained concerning his plans and intentions in the great struggle against Spain. To gain an adequate knowledge of this wonderful man, one should read Motley's "Rise of the Dutch Republic." He guided the Netherlands in the long struggle against Spain that resulted in their freedom, but was afterwards assassinated.

WILLIAM OF MALMESBURY, an English historian who lived in the first half of the 12th century. His chief work, the "Gesta Regum Anglorum," is a valuable account of English affairs from the landing of the Saxons to his own time. He wrote other historical and biographical works.

WILLIAM OF WYKEHAM. See *Wykeham.*

WILLIAMS. SIR GEORGE, *b.* 1821, *d.* 1905; was educated at Tiverton School, and entered the well-known business of Hitchcock, Rogers, & Co., St. Paul's Churchyard, London, at the age of twenty. He devoted his evening hours to the religious and social welfare of his fellow-employees. Out of their meetings for mutual improvement sprang the Young Men's Christian Association. He married Mr. Hitchcock's daughter and became a partner in the firm, "Hitchcock and Williams." At the Jubilee of the Association, in 1894, he was knighted.

WILLIAMS, JOHN, *b.* 1796, *d.* 1839, missionary and martyr, commenced his career of devotion at the age of twenty under the auspices of the London Missionary Society. He had great success among the natives of the Society Islands, in the South Pacific, not only imparting Christianity, but a genuine love of civilization. In 1834 he visited England, where the account he gave of his labours excited great interest. Returning to his labours, he was cruelly murdered by the natives of the New Hebrides.

WILLOUGHBY, SIR HUGH, the leader in an expedition which resulted in our first intercourse with Russia through the port of Archangel, on the White Sea. He was sent, in 1553, by some London Merchants, on a voyage of discovery, but a storm separated the ships, and Willoughby and his men were cast ashore in Lapland. Here they perished, but their remains were found, together with Willoughby's journal.

WILL-O' THE-WISP, same as *Ignis Fatuus,* which see.

WILLOW, a tree or shrub belonging to the order of catkin-bearing plants. There are many species, most of them valuable for their timber, their branches, or their bark. The largest may attain a height of about 80 feet. Willows, under the name of *osiers,* are much used in basket-making, and vast quantities are grown in Holland for this purpose.

WILLS, WILLIAM JOHN, *b.* 1834, *d.* 1861, Australian explorer, was trained for the medical profession, but emigrated in 1852 to Australia. Here he became a surveyor, and in 1860 took part in an expedition to cross the Continent from Melbourne to the Gulf of Carpentaria. With only three companions he reached the Gulf, but perished when half the return journey was accomplished.

WILSON, JOHN (Christopher North), *b.* 1785, *d.* 1854, was the eldest son of a wealthy manufacturer of Paisley. Educated at Glasgow and Oxford Universities, he was a grand example of the "mens sana in corpore sano," so often praised, but too seldom seen. The loss of his fortune, after he had married and settled down, turned him to literature, and for many years he was the main support of Blackwood's Magazine. His "Noctes Ambrosianæ" had an immense vogue in their day.

WILSON, RICHARD, *b.* in Montgomeryshire, 1714, *d.* 1782, a talented landscape painter, and one of the original members of the Royal Academy. He acquired considerable celebrity as a portrait painter, but his landscapes never became popular, and they failed to secure him a competence. "Niobe," and the "Villa of Mæcenas," are his best works.

WINCHESTER, one of the most interesting towns in the kingdom from an historical point of view, stands on the Itchen, about 14 miles north of Southampton. The Britons had a settlement here; the Romans improved it; the west Saxons made it the capital of their kingdom. The beautiful cathedral is an epitome of early English history, containing the remains of many Saxon kings, of William Rufus, and of many bishops and celebrated persons. The restored castle, with its grand hall, also claims attention. The college, founded by William of Wykeham, was opened in 1393, and now provides education for 450 boys. A mile away is the hospital of Saint Cross, dating from Stephen's time.

WINDMILL. A mill which utilizes the pressure of the wind as motive power for performing mechanical work, such as grinding, pumping, and sawing. The wind gives a circular motion to four vanes radiating from the "wind-shaft," which, by bevelled cog-wheels, transfers the rotary movement to a vertical shaft in the tower of the mill. The "cap" which carries the wind-shaft is free to move

round horizontally so that the sails may take the wind, this adjustment being automatically regulated by a secondary set of small vanes placed opposite and at right angles to the sweep of the chief vanes. By checking the revolution of the small vanes by worm-screws, the "cap" is made to veer to meet the wind. The sails are skewed so as to take a rotary motion even from a face wind, and their frame-work is covered with canvas which has to be reefed according to the strength of the wind. In the Netherlands they are used for the ceaseless work of pumping and raising water, but in England they have been replaced by the steam-engine. It is probable that they may be used extensively in the future for electric accumulators.

WINDS are atmospheric currents caused by inequalities in the density of the air. They are usually due to the flow of cold, dense air towards heated areas. Thus, *sea-breezes* blow towards the land during the day because, the land being warmer than the sea, the land-air is less dense than the sea-air. At night the land cools quickly and a *land-breeze* sets in towards the sea. The same action is seen on a larger scale in the *monsoons* which blow over Southern Asia from April to October as rain-bearing south-west winds. Again, the high temperature of the tropics causes the constant winds known as the *trade-winds*. These blow towards the equator from the north and south, but the rotation of the earth from west to east deflects them, so that they occur as north-easterly winds in the northern hemisphere and south-easterly in the southern. They are felt for 30° north and south of the equator, and their regularity in the Atlantic and Pacific Oceans is of great assistance in the navigation of sailing vessels. The dry, oppressive *east-wind* that visits these islands in April and May is part of a cold current that comes from the frozen plains of northern Europe towards the warmer south. Many winds, such as the *simoom*, *sirocco*, *harmattan*, are local and depend on local conditions. A *light breeze* has a velocity of about 15 miles an hour, a wind of 20 miles would be termed by sailors a *steady breeze*, 40 miles would constitute a *gale*, 60 miles a *storm*, and anything more severe than 80 miles would be an irresistible *hurricane*.

WINDSOR, a town in Berkshire, on the Thames, 21 miles west of London. It derives its importance chiefly from the vicinity of the Castle, which has been a royal residence from Norman times. The parks surrounding the castle are celebrated for their beauty, and have a collective area of over 20 square miles. Across the river is the celebrated Eton College, and 5 miles south the beautiful lake called Virginia Water.

WINE. See *Med. Dict.*

WINKELRIED, ARNOLD VON, one of the great heroes of the struggle for Swiss independence. At the decisive battle of Sempach, near Lucerne, in 1386, the Austrians formed a dense mass of steel, which the utmost efforts of the Swiss failed to penetrate. At last Winkelried rushed forward, grasped as many of the Austrian spears as he could, and bore them to the ground by sheer weight, thus making a path for his comrades over his pierced body.

WINNINGTON-INGRAM. See *Ingram, Winnington.*

WINNIPEG, the capital of Manitoba, a province of the Dominion of Canada, stands at the confluence of the Assiniboine and the Red River. Its history begins only in 1873, but so rapid has been its growth that it had, in 1905, a population of 70,000, with all the appliances of a modern city.

WINNIPEG, LAKE, to the north of Winnipeg, has an area of 8,500 square miles, about the size of Wales. By the Red River, the Winnipeg, the Saskatchewan, and other rivers, it collects a vast quantity of water, which it discharges into Hudson Bay by the Nelson River.

WINNIPEG, RIVER has its origin in the low hills north-west of Lake Superior, and flows, under the names of Seine and Rainy River, westward to the Lake of the Woods. Hence it flows as the River Winnipeg into the lake of that name, in a course much interrupted by cascades and falls.

WIRE, metal drawn out into a thread. The metal must be both ductile and tenacious, which limits the number of those available. The metal is rolled into sheets, which are cut into strips of ¼ inch in width, and then drawn through holes of the required size. The various sizes are generally denoted by numbers, according to the standard of the Birmingham wire gauge (B.W.G.). Wire "ropes" are now largely used where the strain is continuous and severe.

WIRELESS TELEGRAPHY, a method of sending signals to a distance without the aid of intervening wires. To M. Marconi belongs the credit of having been the first to see how to apply the isolated discoveries of, among others, such men as Faraday, Hertz, Preece, and Lodge to the perfection of such a system. Its working depends on the following principles. Any sharp electric discharge, as that of a Leyden jar or an induction coil, sets up electrical waves in the surrounding media. The waves travel to great distances and at an enormous speed, and set up electric disturbances in other bodies upon which they impinge, providing such bodies are capable of vibrating at the same rate. The disturbances in these bodies may be made evident to the senses by the employment of certain delicate instruments. Thus, in actual practice, the powerful electric discharges from the "Transmitter" set up electric waves that travel in all directions. In the "Receiver" a delicate piece of apparatus known as the "Coherer" betrays the presence of these waves by permitting to pass through it a current of electricity to the flow of which it offered effective resistance as long as it was unaffected by the electrical disturbances. The first practical application of the Marconi system was the establishment, in 1898, of wireless communication between the North Foreland and the East Goodwin Lightship, and in the following March messages were exchanged between England and France. Since that date great advances have been made. In 1901 the first wireless message was sent across the Atlantic, from Poldhu, Cornwall, to St. John's, Newfoundland. The Marconi system has been adopted by the British and Italian navies, and installations have been set up on all our battleships and on many cruisers. During the Russo-Japanese War the Japanese vessels employed it with great advantage. It is fitted to many of the large Atlantic liners. By its aid, such vessels are able to keep touch with one side or the other throughout the voyage, and the large Cunarders issue a daily newspaper. The United States Navy Board have adopted the system invented by Dr. de Forest, and are installing it on all their battleships and cruisers. Many stations for working this system have been built along the Atlantic coast and on the shores of the great Lakes, and the company is erecting at Panama a mast that it is estimated will be able to send messages from 2,000 to 3,000 miles.

WISHART, GEORGE, a Scottish reformer and martyr of the 16th century. He travelled a good deal on the Continent and in England, where he gained the favour of Henry VIII. Returning to Scotland in 1544, he roused the anger of Cardinal Beaton by his sermons against Roman Catholic corruption. Put on his trial for heresy, he was condemned and burnt at St. Andrews, 1546.

WITCHCRAFT, the supposed art of producing supernatural effects of a malignant nature by the agency of evil spirits. Belief in the reality of this power is very ancient and wide-spread, and is still prevalent among the ignorant of most countries. During the Middle Ages it was considered a sacred duty to rid the land of witches. It is computed that between 1484, when Innocent VIII. issued his bull authorising the Inquisition to punish this crime, and 1782, no less than 300,000 women suffered death on the Continent as witches. Nor was England free from this dread of witchcraft, and the cruel treatment of suspected women. Lancashire seems to have been one of the favourite haunts of witches. Ainsworth's "Lancashire Witches" gives a vivid picture of the hold they had on the popular imagination—but other counties shared in the same superstitious belief, and in all some hundreds were put to death, mostly in the 17th century. The last trial in England was that of a woman convicted at Hereford, in 1712, but not executed.

WITENAGEMOT, the great council of the kingdom in Saxon times. It consisted of the king and the great nobles and churchmen. The common people were allowed to be present, and to express approval or disapproval of the speeches by their shouts. The Witan, or Wise-men, gave the king their advice, but the decision lay with him. When the king died, the Witan chose his successor without necessarily having regard to hereditary claims.

WITTENBERG, a town of Saxony, on the Elbe, 60 miles south-west of Berlin. It is chiefly interesting as having been the birth-place of the Reformation on the Continent. The Church where Luther nailed his famous challenge on the door was restored in 1892, and re-opened with much ceremony.

WITWATERSRAND, a low ridge of hills extending about 60 miles from east to west, in the south-west of the Transvaal. Here are the famous gold-fields, and at the eastern end of the Rand is Johannesburg. Indications of gold were found here in 1885, and the district was "proclaimed" a gold-field in 1886.

WIZARD OF THE NORTH, THE. A name given to Sir Walter Scott.

WOAD, a kind of plant belonging to the order *cruciferae*, once much cultivated for the blue dye obtained from its leaves. The extended use of indigo has made the plant go almost out of cultivation. It is supposed to be the *vitrum* with which the Britons stained their bodies according to Cæsar's account.

WODEN, or **ODIN,** in Scandinavian mythology, the ruler of heaven and earth, the source of all movement and activity, and the bestower of rewards and punishments. From his palace go daily his two black ravens *Huginn* (Thought) and *Muninn* (Memory), to learn what is doing in the world, and to his court in Valhalla go the spirits of brave men after death to revel in the feast and the fight for evermore.

WOLCOT, JOHN (Peter Pindar), *b.* near Kingsbridge, Devon, 1738, *d.* 1819; an English satirist. In early life he practised

as a physician in Jamaica. On returning to England he was ordained in the Church of England, 1769, but resumed practice as a physician. About 1780 he settled in London, and became noted for his coarse but witty satires on George III.

WOLF, THE, an animal akin to the dog, widely spread in Europe, Asia, and North America. It ceased to exist in England in the 16th century, and in Scotland and Ireland about a century later. This animal is still common in Russia, and in certain districts of Germany and Hungary. In North America it ranges from Greenland to Mexico, but is not found in South America. Its appearance varies considerably in different countries, but everywhere its habits are the same, everywhere it is known for its havoc among flocks of sheep. In winter, wolves gather in large packs, and dare to attack horses and men. In Russia, as many as 200 deaths in a year are set down to their account, and the damage to live stock approaches one million sterling annually.

WOLFE, JAMES, *b.* at Westerham, Kent, 1727, *d.* 1759, commanded the English at the taking of Quebec. Joining the army at the age of fifteen, he served at the battle of Dettingen, in 1743. He took part in most of the operations of succeeding years, and his merit was soon brought to the notice of Pitt when he was looking out for some one to take command against the French in North America. In command of about 9,000 men, he was sent to take Quebec, but the vigilance of Montcalm long foiled all his efforts. At length the unguarded path leading from the river's bank up to the Plains of Abraham was revealed to him, and he succeeded one night in getting his men up unnoticed by the French. The next morning saw the decisive battle fought, the two generals killed, and the cause of France in Canada hopelessly lost. Wolfe's body was interred in Greenwich Church, and a monument erected to his memory in Westminster Abbey.

WOLF, PRAIRIE, or Coyote, a small kind of wolf found in Mexico and Texas. It is extremely cunning and can only be destroyed by poisoned bait. Its fur is heavy, it feeds on any kind of animal offal, and it howls most annoyingly at night.

WOLLASTON, WILLIAM HYDE, *b.* at East Dereham, Norfolk, 1766, *d.* 1828, one of England's great scientists, was educated for the medical profession, but relinquished it for the paths of scientific investigation. He made some most important discoveries, the chief being his process for obtaining platinum from the native ore. He also discovered two new metals, palladium and rhodium, and added to the existing knowledge in almost every branch of science.

WOLSELEY (Garnet Joseph), **VISCOUNT,** *b.* at Dublin, 1833, entered the army in 1852, and soon saw active service in Burma, and served through the Crimean War, the Indian Mutiny, and the China War of 1860. The next ten years saw him in Canada, where his organization of the Red River expedition brought him credit. But the Ashanti expedition of 1873 set the seal on his fame, for the clockwork precision of the movements that enabled him to land his men on the Gold Coast, march inland to Kumasi, beat the foe, and again embark within the short time available, was marvellous. His brilliant operations in Egypt against Arabi Pasha in 1882, ending in the famous moonlight charge and battle of Tel-el-kebir, added still further to his fame. He was now made Baron Wolseley, besides receiving the thanks of Parliament and the rank of general. That he failed to rescue Gordon from Khartoum was not his fault, and the Government recognised this by making him a Viscount for his services in the expedition. His services as military adviser and reformer have been great.

WOLSEY, THOMAS, *b.* at Ipswich, 1471, *d.* 1530, took his degree of B.A. at the age of fifteen at Magdalen College, Oxford, became a Fellow of his College, and in 1506 became chaplain and secretary to Fox, Bishop of Winchester. He visited the Low Countries on a diplomatic errand in 1508, and was rewarded with the deanery of Lincoln. He became the chief adviser of Henry VIII., and in 1514 was made Archbishop of York. In 1515 he was appointed Chancellor and made Cardinal. It is said that he aimed at the Papacy, and that he missed it narrowly on two occasions. His foreign policy gave England a high place in European affairs; at home he fostered a royal despotism. He dissolved the smaller monasteries, but founded Christ Church, Oxford, as a seat of the "new learning." His reluctance to further the king's designs to procure a divorce from Catharine of Aragon, led to his loss of the royal favour. He was stripped of his possessions, and ordered to retire to his northern diocese. There he was arrested on a charge of treason, but died at Leicester on his way to London, 1530.

WOLVERHAMPTON, the chief town of the "Black Country," is on the South Staffordshire coal-field, 13 miles N.W. of Birmingham. Locks, and small iron-ware goods, tin-plate, and piping are the chief manufactures; population 98,000.

WOLVERINE, THE, or American glutton, is a fur-bearing animal found in the mountainous and northern parts of North America. It is gluttonous, fierce, and cunning, and interferes with the ordinary snares of the trappers, without being trapped itself. It is from 2 to 3 feet in length, and has a valuable pelt.

WOOD (Field-Marshal), **SIR EVELYN,** *b.* 1838, at Cressing, Essex, joined the navy at fourteen, and served with distinction in the Naval Brigade in the Crimea. He then joined the army, and saw much service during the Indian Mutiny, gaining the V.C. He did good work in the Ashanti War, 1874, the Zulu War of 1879, and the Transvaal War of 1880-81. Since then he has held high command in Egypt and at home.

WOOD, MRS. HENRY, *b.* at Worcester, 1814, *d.* 1887, a popular novelist, among whose numerous works "East Lynne," "The Channings," and "Oswald Cray," are perhaps the best known. She lived for many years in France, with her husband, a shipping merchant, and commenced to write in London after his death. Her books never fail to be commonplace and sensational, but they afford real enjoyment to a large class of readers.

WOODCOCK, a bird allied to the snipes, belonging to the group of wading birds. In the daytime it hides in the brushwood, and at night feeds in the marshes. It nests on the ground in the woods, and is known to carry its young to the marshes to feed at night, and to bring them back before daylight.

WOOD-ENGRAVING, the art of graving "blocks" of box-wood so as to form dies for the reproduction of pictures. The required drawing is done upon the block, and the wood is cut away so as to leave all the lines of the drawing in relief. For a large engraving, several blocks are used and afterwards joined. The utmost skill and artistic ability are shown in the relative delicacy and boldness of the lines. German wood engravings of the 15th century frequently accompanied the texts of the first-printed books, and formed an integral part of the blocks of type before movable type was introduced. Dürer advanced the art of engraving in the 16th century, and the genius of Bewick at the beginning of the 19th century gave it a great impetus.

WOODS AND FORESTS, HIS MAJESTY'S. The lands reserved to the crown at the Conquest had for a long time to provide for all the ordinary expenditure of the Government. But as Parliament assumed more and more responsibility for the expenses of administration, it was felt that it should fully control all revenue. Hence, in 1810, the crown surrendered all control of the remaining crown property in return for a fixed income, and these estates were placed in the management of a board of Commissioners. The annual revenue from this source is about £470.000.

WOODSTOCK, a small town near Oxford, adjoining Blenheim Park, the seat of the Duke of Marlborough. The Blenheim estate was granted, in 1705, to the first Duke, as a reward for his services to the nation, and to commemorate his victory at Blenheim, 1704. The title of Scott's Cavalier romance of "Woodstock" is taken from this town.

WOODVILLE, ELIZABETH, *b.* 1437, *d.* 1492, daughter of Sir Richard Woodville. Left a widow by Sir John Grey, she was secretly married to Edward IV., and became the mother of the "Two Princes" that perished in the Tower, and of Elizabeth, who was married to Henry VII. It was Edward's marriage with Elizabeth Woodville that caused the Earl of Warwick, "The King-Maker," to make war upon his sovereign.

WOOL, the most valuable of clothing materials for use in cold or temperate climates, is got from the fleece of the sheep. It differs from hair or fur in the possession of rough, surface scales which give it its "felting" or binding property. The lustre of certain wools, such as mohair and alpaca, is due to the comparative smoothness of the fibre. The Australian merinos, and the wools of New Zealand and the Cape, supply most of the raw material for the good "woollens" manufactured in Yorkshire. English wools, on the other hand, are used for special purposes: Southdown for flannel, Lincoln and Leicester for dressy cloths of smooth texture, and Cheviot for the stout "Cheviot" cloth. *Mungo* and *shoddy* are wool substitutes obtained by grinding up clippings, old cloth, old stockings, and blankets. They are used to mix with new wool to cheapen the material.

WOOLSACK, the seat of the Lord Chancellor of England in the House of Lords, is a kind of red, wool-cushioned ottoman, which is placed before the throne. The Lord Chancellor, seated on the woolsack, acts as Speaker to the House.

WOOLWICH, a township 9 miles below London Bridge, is now a suburb of London. The chief port of the borough is on the south bank of the river, but North Woolwich on the Essex side is growing rapidly. The importance of the town is due principally to the Royal Arsenal, a Government gun-factory, which usually employs over 12,000 men. The public are admitted to the Ordnance Factories and Ordnance Store Depôt, on two days in the week, by orders which may be obtained from the War Office. There are also extensive barracks for the Royal Artillery and the Army Service Corps. Woolwich is one of the chief centres of military education. Here are situated the Ordnance College and the Royal Military Academy.

WORCESTER, a cathedral city and county town. Besides its historic and

archæological interest, it is a town of commercial importance, being the seat of the royal porcelain works, Dent's glove factory, and Lea and Perrin's Worcester Sauce factory. Here Cromwell defeated Charles II., 1651. Birmingham and a populous district around it were withdrawn, in 1904, from the see of Worcester, and formed into a separate diocese.

WORCESTER, MARQUIS OF, *b.* about 1600, *d.* 1667, a royalist nobleman, devoted to the service of Charles I. in his war with Parliament. All his leisure time was devoted to scientific and mechanical invention, and his "Century of Inventions" (1655), contains among other things a description of an engine worked by steam and applied to the construction of fountains. Worcester's Steam-engine was probably the first ever invented.

WORDSWORTH, CHRISTOPHER, the youngest brother of the poet, *b.* 1774, *d.* 1846. His "Ecclesiastical Biography" is still read with profit and interest. His two sons, Charles and Christopher, were remarkable for their scholarship. Charles, the author of a well-known Greek Grammar, became Bishop of St. Andrew's; Christopher was made Bishop of Lincoln, and left behind him many learned theological works.

WORDSWORTH, WILLIAM, *b.* 1770, at Cockermouth, *d.* 1850, one of the greatest of English poets. He was educated at Hawkshead, near Coniston, and at John's, Cambridge. He was in France at the outbreak of the Revolution, and was in full sympathy with the spirit and aims of the moderate republicans—the *Girondists*. His earliest poems were written in collaboration with Coleridge, and published under the title "Lyrical Ballads." In this as in all his work, Wordsworth strove to reform poetical taste by advocating simplicity, minute observation, and truth to nature. His longer poems, the "Excursion" and the "Prelude" are a poetical history of his own mental growth. As he lived for the greater part of his life near Grasmere and Rydal, he is very properly included with Southey and Coleridge, under the term "Lake-poets."

WORMS, one of the most ancient cities of Germany, is situated in Hesse Darmstadt, on the left bank of the Rhine. It was one of the residences of Charlemagne, and Wagner has made it the scene of the Nibelungenlied. Here, in 1521, Luther defended his theological position at a congress of German Princes known as the Diet of Worms.

WORMS, EARTH. See *Earth-worms*.

WORTH, a village in Alsace-Lorraine, where the Germans defeated the French at the opening of the great Franco-German War, 1870.

WOUVERMANS, PHILIP, *b.* at Haarlem, 1612, *d.* 1668, a Dutch painter who excelled in cavalry and hunting subjects.

WRANGLER, literally a disputant in the schools (at Cambridge), is a term now applied to a man who attains a place in the first-class in the mathematical tripos at Cambridge. The head wrangler used to be known as the "senior wrangler," but that distinction is at an end as the names are no longer arranged in the order of merit.

WRECKS, are ships or cargoes cast ashore by the sea. All action with regard to wrecks in the United Kingdom rests with the Board of Trade, who appoint *receivers* to take evidence as to ownership and report to the Board. If no owner or other claimant comes forward the proceeds of the sale of the wreck go to the National Exchequer after a year. *Salvage* may be claimed as recompense by private persons who have rescued the vessel or its cargo. *Wrecking*, the iniquitous practice of removing beacons and misplacing warning lights, was at one time common on the Cornish coast. Ships were in this way led to follow false lights, and wrecked upon the rocky coast, and then plundered.

WREN, SIR CHRISTOPHER, *b.* in Wilts., 1632, *d.* 1723, the architect of St. Paul's Cathedral, was also a Professor of Astronomy at Oxford, and one of the founders of the Royal Society. Wren prepared plans for the restoration of "old St. Paul's," but the fire of 1666 rendered a new building absolutely necessary. This he designed after the style of the cathedral of St. Peter's at Rome. He also presented plans for a complete re-building of the city which had been wrecked by the fire, but his work in that direction was confined to the building of the Royal Exchange and of some fifty churches. Among his other notable works are the Monument, Greenwich Observatory, and Chelsea Hospital. He was buried in St. Paul's, and his tomb is marked by the inscription, "Si monumentum requiris, circumspice." (If you would find his monument, look around).

WRITERS TO THE SIGNET, the principal class of solicitors in Scotland. They were so called because anciently it was their business to prepare charters, warrants, etc., for the King's signet. They have lost some of their exclusive privileges lately.

WRITING. The oldest forms of writing of which we have any examples are Babylonian and Egyptian. The former is cuneiform, that is, the characters are wedge-shaped; they were written on clay, and the clay thus inscribed, on being baked into bricks, formed permanent records, many of which have in recent times been unearthed and interpreted. The same type of characters was also used in Babylonian inscriptions on stone. Egyptian writing is still more ancient than the Babylonian, going as far back as 3000 B.C. Until 700 B.C., Egyptian writing consisted of hieroglyphics on stone. Then papyrus came into use as a writing material, with a new style of writing, known as the *hieratic*, a simpler form of the hieroglyphic. About the year 200 B.C. the supply of papyrus from Egypt to Greece was stopped, and parchment, a costly material made from skins, began to take its place. Generally speaking, parchment writing is more careful than papyrus writing because of the value of the material, and mediæval manuscripts show a remarkable development in the beauty of even individual letters. Printing followed in the wake of the introduction of paper, and the current script hand owes its development to the use of this material. It is interesting to note that our English letters arrange themselves in three distinct classes: thus "A" is a chisel letter originally inscribed on stone, "a" is a parchment letter, and "*a*" is a paper or script form. Among Aryan nations, the usual direction of writing is from left to right, as in English. Hebrew, Arabic, and Semitic writing generally take the opposite direction. Chinese is written in vertical columns, which follow one another from right to left.

WÜRTEMBERG, a kingdom of Germany, bounded by Lake Constance on the south, Baden and the Black Forest on the west, and Bavaria on the east. Within its territory lies the state of Hohenzollern. Stuttgart is the capital, and Tübingen is a university town. Education there is of a high standard, even for Germany. The valleys are fertile and produce excellent wine and fruit. Industries, including metal work of all kinds, and the making of scientific and musical instruments, occupy nearly half the population: population 2,000,000.

WYATT, SIR THOMAS, *b.* 1520, *d.* 1554, was one of the adherents of Lady Jane Grey, on whose behalf he headed a rebellion in 1554, and, being taken prisoner, was executed.

WYCLIF, JOHN, *b.* near Richmond, Yorkshire, about 1324, *d.* at Lutterworth, 1384. He became master of Balliol in 1360, and subsequently rector of Lutterworth. He is generally regarded as the leading precursor of the English Reformation. Having translated the Bible into English, he organised a body of preachers, known as "poor priests," to spread his teaching. He combated the evils of enforced confession and the doctrine of transubstantiation. His followers, who were called Lollards, combined loyalty to his teaching with socialistic sympathies with the labour movement that followed the Black Death. Wyclif died in 1384, but his writings were condemned at the Council of Constance, and his bones were exhumed and burned as a mark of the Church's condemnation of his teaching.

WYKEHAM, WILLIAM OF, *b.* at Wykeham, Hants., 1324, *d.* 1404, became Bishop of Winchester in 1367, and is justly honoured as the founder of Winchester College, the most ancient of our "Public Schools," and of New College, Oxford. He was a great architect, and one of the inventors of the perpendicular style. He personally supervised the restoration of Winchester cathedral, and carried out excellent reforms at the Hospital of St. Cross, near Winchester. His motto, "Manners makyth man," is still the motto of Winchester College.

WYVERN, a serpent or viper. The word is only another form of viper with *n* accidentally added. The word mostly occurs in heraldry, where it means a *charge*, that is, a figure of a real or imaginary animal depicted on a coat-of-arms. It is a kind of dragon with wings, only two legs, and a serpent-like tail.

XANTHIPPE, the wife of Socrates, the Greek philosopher, notorious as a scold.

XAVIER, ST. FRANCIS, *b.* 1506, *d.* 1552, assisted Loyola in founding the Jesuit Society. In 1541 he departed to the Portuguese East Indies and laboured there among both Europeans and natives with wonderful success. He preached in India and Ceylon, and even in Japan, and many witnesses attested to his miraculous power of tongues. He died while arranging an extension of the work of the society to China.

XENOPHON, *b.* about 430, *d.* 355 B.C., a great Greek historian and military leader. In 401 B.C. he joined a body of 10,000 Greek mercenaries under Cyrus, who aimed at usurping the throne of Persia. Cyrus was slain, and it devolved upon Xenophon to lead back the Greeks over the mountains of Armenia, through a hostile and rugged country to the Black Sea, a feat which he achieved successfully. Subsequently he attached himself to Agesilaus, King of Sparta, a hero whom he greatly admired, and the last years of his life were spent in recording his experiences in the "Anabasis," a narrative of the Retreat of the Ten Thousand; the "Agesilaus," a memoir of the Spartan king; the "Memorabilia," or memorials of his old master, Socrates; and the "Cyropædia," or the education of Cyrus. The "Hellenica," his best historical work, covers forty-nine years of Greek history.

XERXES I., king of Persia (485–465 B.C. led a vast expedition against Greece. He crossed the Hellespont by a bridge of boats, and cut a canal through

Mount Athos. Leonidas, king of Sparta, and his immortal 300, held the Persian host at the narrow pass of Thermopylae until every man of the Spartans was slain. The Persian fleet was destroyed at Salamis before the eyes of Xerxes, who looked on from a lofty mound, and he returned dismayed at the loss of his great fleet, after destroying Athens. Xerxes was murdered by Artabanus, and succeeded by his son.

YACHT. It differs from a sailing-boat in being decked and fitted for the accommodation of a cruising party; it may be either a sailing or a steam vessel. The development of the modern yacht dates from the commencement of the 19th century, and the establishment of "The Yacht Club" at Cowes. This club now holds the leading position in Great Britain, under the title of the Royal Yacht Squadron. The New York Club holds a similar position in America. The *America*, an American schooner, visited Cowes in 1851, and easily carried off the R.Y.S. cup. This cup was set apart by the will of the winner as an international prize. Many attempts have been made by Canada and the mother country to recover the "America Cup," but neither the three *Valkyries*, built by Lord Dunraven, nor the three *Shamrocks*, built by Sir Thomas Lipton, have succeeded in bringing back the trophy. The rules for measurements and allowances in yacht-racing are drawn up by the Yacht Racing Association, a body which is looked upon as the final authority in yachting questions. Yachting is encouraged and honoured by the Admiralty in various ways, but especially in the permission granted to various clubs to fly the white, blue, or red ensign. King Edward VII. and the German Emperor are ardent patrons of yachting.

YAHOOS, a race of debased human beings, who are described in Gulliver's Travels as being inferior to their neighbours, the Houhynhnms, a race of enlightened horses.

YAK, THE, or Tibetan ox, lives in the high altitudes of the mountains of Tibet, where it is domesticated by the natives. Its heavy coat of silky hair gives it an appearance of great size; it is an excellent beast of burden, and it yields rich milk. Yaks were used extensively for transport work during the British Expedition to Lhasa in 1904, and they did their work excellently except in the valleys, where they suffered from the comparative heat.

YAKUTS, people of Semi-Turkish origin who dwell in the dreary plain of the Lena in Siberia.

YAKUTSK, the chief town of a province of Russian Siberia, situated near the River Lena. It has a population of over 5,000, and trades in furs, hides, and ivory.

YAM, THE, grows plentifully in the East and West Indies. Its long tubers yield a sweet mealy food, but, although the plant will thrive in England, the summer heat is insufficient to develop the tubers. The plants are propagated like potatoes.

YANG-TSE-KIANG, the longest and most important of the rivers of China, rises in the mountains of Tibet, and, after a course of 3,200 miles, flows into the China Sea by an estuary on which stands the port of Shanghai. Its basin includes the greater part of China proper, and its commercial importance is enormous.

YANKEE, a word that in England means a native of the United States, but in America means simply a native of one of the New England or Eastern States. The word is said to be derived from the Indian "Yengees," the nearest they could get to "English."

YARMOUTH, GREAT, a seaport and an important herring fishery station, on a peninsula of sand on the coast of Norfolk, between Lowestoft and Cromer. Its magnificent stretch of sands and bracing climate attract many summer visitors. The quays, with their quaint Elizabethan houses and their innumerable "rows" or alleys, are a feature of interest. The parish church is a magnificent 15th century building; population 52,000. Gorleston, a suburb 2 miles south of Yarmouth, is a favourite summer resort.

YARRA-YARRA, a river of Victoria, Australia, on which stands Melbourne. It flows into Port Philip after a course of 150 miles.

YEAR, the period in which the earth accomplishes its journey round the sun and takes up the same position again in relation to the sun. This is the *solar* year, consisting of 365 days. 5 hours, 48 minutes. 49 seconds. The *sidereal* year, or period it takes for the earth to come into the same position again with regard to the sun and a fixed star behind it, is about 20 minutes longer.

YEDDO, now called *Tokio* (which see).

YELLOWPLUSH PAPERS, THE, written for Fraser's Magazine in 1837 by Thackeray, and published in book form in 1841 under the title of "Comic Tales and Sketches." They form a playful satire upon flunkeyism, whether it be the flunkeyism of the wealthy or that of their servants.

YELLOW SEA, THE, or Hwang-hai, is a wide inlet of the Pacific Ocean, bounded on the north by the isthmus of Korea, and terminating in the Gulf of Pechili. The command of the Yellow Sea by the Japanese and their blockade of Port Arthur, which commands the entrance to the Gulf of Pechili, were the chief events of the naval struggle during the first year of the Russo-Japanese War of 1904-5.

YELLOWSTONE NATIONAL PARK, in the north-west corner of Wyoming, is a wonderful region of cañons, cataracts, hot-springs, geysers, and mud volcanoes. The Yellowstone River passes through the Grand Cañon (20 miles), and near it, towards the south of the Park, stands a calcareous mass of terraces with warm, many-coloured pools, known as the White Mountain. The geysers of the Park, the finest in the world, are the most remarkable feature of this wonderful area. Congress set apart this district in 1872 as a National Park, and a body of cavalry is employed to prevent the destruction of the forests, wild animals, and natural features. The result of this foresight is that numerous species of wild animals have found refuge here, which have elsewhere been exterminated.

YEOMAN, a small farmer or countryman above the standing of a labourer, but below that of a franklin or gentleman-farmer. A corps known as *Yeomen of the Guard* was formed by Henry VII., and they still wear the uniform of the Tudor period. They consist of about 110 officers and men, and they are employed on state occasions as a royal bodyguard. The "Beef-eaters" of the Tower, who wear a similar uniform, are a different corps, founded in the reign of Edward VI.

YEOMANRY, a body of volunteers formed during the Napoleonic period, and organised according to counties, the Lord-Lieutenant of each county being in chief command. Each yeoman provides his own horse, and in return receives a grant from Government. Among the yeomanry corps raised for service in the South African War, the Scottish Horse and Lovat's Scouts are still retained as distinct yeomanry regiments, although they do not come under a county qualification. The Government provides arms, and the regiment must turn out for training once a year, besides holding drills. The yeomanry may be called out to aid the civil power in quelling riots and other serious disorders in the State.

YEW, one of the most characteristic evergreen trees of Britain, attains a great age, and yields an exceedingly hard timber. It is commonly found in country churchyards, and its occurrence along the old Pilgrim's way through Surrey and Kent to Canterbury is a feature of striking curiosity. Yew was the favourite wood for the old English long-bow, and its extreme hardness renders it suitable for cabinet work, axle-trees, and the like, where strength and durability are required.

YIDDISH, a dialect composed of corrupt Hebrew and provincial German, and spoken a good deal in the East End of London, owing to the large number of Jewish immigrants, many of whom can speak nothing else.

YOKOHAMA, the chief port of Japan, 17 miles south of Tokio, was a mere fishing village before 1850. The bay, an open roadstead, affords good anchorage, and is strikingly beautiful. Harbour works, including the erection of two piers, 1¼ miles in length, have prevented the danger of silting. The town has a considerable foreign community, and many British merchants have their head-quarters there; population 200,000.

Y. M. C. A., (Young Men's Christian Association), was founded in 1844, "as a society for improving the spiritual condition of young men engaged in the drapery and other trades." Courses of lectures were begun, suitable quarters were secured in Aldersgate Street, and, in 1881, the growth of the movement led to the purchase of Exeter Hall in the Strand. There are branches in over 1,000 districts or towns in England, and the work is carried on in every part of the world. Gymnasiums, restaurants, reading-rooms, libraries, Bible-classes, devotional meetings, and apartment registration are the leading features in the work of the different branches. The society is undenominational, and is greatly supported by the Evangelical or Low Church section of the English Church. A similar and excellent work is carried on by the Young Women's Christian Association. In London alone there are over 50 establishments where girls find their various wants cared for, and where the cost of the various privileges is remarkably low.

YONGE, CHARLOTTE MARY, *b.* at Otterbourne, 1823, *d.* 1901, a novelist and writer of considerable ability and wide range. Besides "The Heir of Redcliffe," "The Daisy Chain," and "The Dove in the Eagle's Nest," she wrote a History of France, a Life of Bishop Patteson, and a Biography of Hannah More. In addition to translations and her editorial work in the "Monthly Packet," she published over 110 volumes. Her works are spirited, of high moral tone, and interesting.

YORK, the county town of Yorkshire, is a cathedral city and the seat of an Archbishop. In the time of the Roman occupation of Britain, York (then called *Eboracum*) was the capital of the north, a position which it continued to hold in the Middle Ages. The minster, one of the finest cathedrals in England, is of noble proportions. Its beautiful east window preserves its mediæval glass, and is unrivalled in richness of effect. The city still has its walls and several of its old gates or "bars." It is under the jurisdiction of a Lord Mayor; population 80,000.

YORK, DUKE OF. (1) Richard, leader of the Yorkist party in the War of the

Roses, was slain at Wakefield, 1460. (2) Richard, second son of Edward IV., was murdered in the Tower, probably at the instigation of Richard III. (3) Frederick, second son of George III., an incapable leader, failed in an attempt to aid the Austrians against the French in 1793. He was similarly unsuccessful in 1799. A handsome column, surmounted by a statue, in a prominent position, near the Pall Mall end of Regent Street, London, was raised to his memory.

YORK, HOUSE OF, a branch of the English royal family descended from Lionel, Duke of Clarence, and Richard, Duke of Cambridge, the third and fifth sons of Edward III. The claim of the Yorkist princes was therefore superior to that of the Lancastrian princes, who were descended from John of Gaunt, Edward's fourth son. The kings of the House of York were Edward IV., Edward V., and Richard III.

YORKSHIRE, the largest English county, is divided into three parts called Ridings, i.e., thridings or thirds. The North and East Ridings are chiefly agricultural, the West is the seat of the woollen industry, and a mining district. The county is drained almost wholly by the Ouse and its tributaries the Swale, Ure, Nidd, Wharfe, Aire, Don, and Derwent. Wensleydale, the valley of the Ure, is famous for its beautiful villages, but the other valleys are almost equally interesting. These valleys contain the ruins of more than fifty monasteries, formerly of great importance and wealth in the days when the Cistercians fed their flocks of sheep on their rich pastures. The Cleveland Hills in the north-east of the county, yield the hematite iron-ore, which is smelted at Middlesborough and Stockton. York, the county town, stands on the Ouse in the centre of the Yorkshire Plain; but the great manufacturing towns—Leeds, Bradford, Sheffield, Rotherham, Halifax, and Huddersfield—are on the south Yorkshire coal-field; Hull is the chief sea-port.

YORKTOWN, on the river York, Virginia, was the scene of the surrender of Lord Cornwallis to Washington in 1781, during the War of American Independence.

YORUBA, a district in the hinterland of Lagos in West Africa. It occupies the eastern half of the slave coast, between Benin and Dahomey, and extends to the north-east as far as the Niger. It is now included in the British sphere of influence.

YOSEMITE VALLEY, a wonderful gorge formed by the river Merced in the Sierra Nevada, California. It is 6 miles in length, and from ½ to 2 miles in width, with perpendicular cliffs of an average height of 4,000 feet. The whole valley is a scene of sublime grandeur, and will be preserved for all time as a National Park. One of its most striking features is the Yosemite Falls. From a narrow ledge the river leaps in three great falls, making a descent of 2,500 feet.

YOUNG, BRIGHAM, *b.* 1801, *d.* 1877, a leader of a religious sect in America, known as the Mormons. He founded Salt Lake City, in Utah, as a Mormon colony, and devoted his energies to furthering its commercial prosperity. He was appointed Governor by the President of the United States (1851), but subsequently had to resign much of his power when the States, in 1869, determined to put down polygamy, which formed a leading feature of the Mormon religion. He left a fortune of £600,000 to his seventeen wives and numerous offspring.

YOUNG, EDWARD, *b.* 1681, *d.* 1765, the author of "Night Thoughts," spent the first forty-five years of his life in literary work and in attendance upon the Marquis of Wharton. He then took holy orders, and held the living of Welwyn, in Hertfordshire. His "Night Thoughts" commemorates the loss of his wife and daughter, and is still read for its occasional excellences and its evident sincerity.

YOUNG, JAMES, *b.* in Glasgow, 1811. *d.* 1883; may be called the discoverer of paraffin. While manager of a chemical works in Manchester, his attention was called to a dark oily liquid found in a coal mine in Derbyshire, from which (and afterwards from Scotch cannel coal) he obtained paraffin by distillation.

YUKON, the chief river of Alaska, flows into the Behring Sea after a course of 2,000 miles. It gives its name to one of the four districts into which the north-west territories are divided. The Klondyke, which flows into the Yukon, at Dawson, is celebrated for the gold-mines in its vicinity. The discovery of gold in the beds of the streams of the Klondyke basin led to a memorable rush there in 1897.

ZADKIEL, the pseudonym of Richard James Morrison, *b.* 1795, *d.* 1874; once a Lieutenant in the Royal Navy. On his retirement he issued his celebrated almanac, thousands of which sold annually. The crystal globe, whence he drew his predictions, is said to have belonged to Doctor Dee, a notorious charlatan of the 16th century.

ZAMBESI, THE, rises in the south-west of the Congo Free State, and flows in an easterly direction to the Indian Ocean, which it reaches after a course of nearly 1,600 miles. Most of its course lies in British territory, but its estuary and lower waters are Portuguese. Navigation is impeded at intervals by cataracts, notably by the Victoria Falls (which see), 900 miles from the sea.

ZANGWILL, ISRAEL, *b.* in London, 1864, was educated at the Jews' free school in Spitalfields, where he taught while studying for his London University degree. In 1892 he produced "Children of the Ghetto," which at once made him a man of mark. His other works are numerous, mostly dealing with phases of Jewish life.

ZANZIBAR, an island off the east coast of Africa, with an important port of the same name, has been under British protection since 1890, when a portion of the mainland, known as the Zanzibar Protectorate, was also ceded to Great Britain. The port of Zanzibar has an excellent harbour, and is the largest city of East Africa. It exports ivory, cloves, copra, rubber, and gum-copal, and its trade amounts to £2,000,000 annually. It was formerly the head-quarters of a great export trade in slaves.

ZEALAND, (1) the largest and most important island of the kingdom of Denmark, lies between the Cattegat and the Baltic, and is separated from Sweden by the Sound. Copenhagen, the capital of Denmark, and Elsinore, are the chief towns. (2) A Flemish province of the Netherlands, consisting chiefly of the low-lying islands at the delta of the Scheldt. Flushing, on Walcheren Island, is the chief port, and Middelberg, on the same island, the chief inland town.

ZEBRA, THE, an animal akin to the horse and ass, but more closely resembling the latter in several characteristics, notably in the fulness of its ears. It is of a white colour with striking stripes of black, vertical on the body and horizontal on the limbs. It is found only in Africa, where it inhabits the more rugged and remote mountain ranges of Abyssinia and central Africa. It is of uncertain temper, and, even though trained from its earliest days, it is difficult to domesticate.

ZEBU, THE, or Brahmin Ox, is closely allied to the common ox, from which it is distinguished by a fatty hump upon its shoulders, and by the slimness of its legs. It is found throughout Southern Asia and in Madagascar. In India, the Zebu is used both as a beast of draught and of burden.

ZEMINDARS, officials in India who, under the Mogul emperors, had to collect the revenue from a certain district, comprising so many villages. Under the British the zemindars have been dealt with as the actual land-owners, and have practically become so.

ZEMSTVO, an assembly of representatives of certain provinces and districts in Russia. European Russia is divided into fifty provinces, and each province into ten to twelve districts. Of these provinces, thirty-four have the institution of the Zemstvo. This means that in these provinces each district has an assembly elected by all the inhabitants for the management of local matters, and that the district assemblies nominate a Provincial Assembly for administering the affairs of the province.

ZENANA, part of a house in India reserved for the women, corresponding with the harem in Turkey. In 1852 Zenana missions were started to uplift the women of India.

ZEND-AVESTA, the ancient sacred lore of the Parsees, consisting, like the Bible, of a collection of sacred writings of many periods and various character.

ZENGHIZ-KHAN. See *Jenghiz Khan.*

ZENO, a Greek philosopher, *b.* in Cyprus, 342 B.C., who, after a long course of study in the various schools of Greek philosophy, founded the great school of the Stoics, about 300 B.C. (see *Stoicism*).

ZENOBIA. See *Palmyra.*

ZERMATT, a great tourist and climbing centre in Switzerland near the head of the Visp valley, a lateral valley from the left bank of the Rhone. The Matterhorn, Breithorn, and Monte Rosa are climbed from Zermatt.

ZERO, the number 0, especially in its technical sense as a starting point in measuring degrees upon a scale, such as the graduated scale of a thermometer or barometer.

ZERUBBABEL, one of the leaders of the Jews, who first returned from Babylon under the proclamation of Cyrus. He was appointed governor of Judea by Cyrus, and for a short time took a leading part in the re-building of the Temple and in the restoration of public worship. (See the Book of *Ezra.*)

ZEUS, in Greek mythology, the chief of the gods. (See *Jupiter.*)

ZEUXIS, a celebrated Greek painter, who excelled in the portrayal of women. He had a high opinion of his own excellence as a painter, but not without justification. He flourished during the last half of the 5th century B.C.

ZINC, a bluish-white metal, which does not perish on exposure to the atmosphere, but assumes a thin surface film, which protects the metal beneath. The metal is mined in Wales, but more extensively in Southern Germany, and in the United States. It is used for zinc roofing, and for plating iron goods, such as coal scuttles and washing tins. The process is commonly known as galvanising. It is also used as a substitute for bronze in cheap art goods. Its chief use, however, is as a galvanizing metal to prevent iron from rusting.

ZIONISTS, Jews who aim at the re-establishment of their nation in Palestine.

For centuries only a dream, this idea has begun, since the late outbreak of Anti-Semitism, to take practical form, and an association has been formed to help forward the movement.

ZION, MOUNT, a hill on which once stood a citadel of the Jebusites, which David captured, and where he built his "City of Zion," or Jerusalem.

ZODIAC, an imaginary band or zone of the celestial sphere sufficiently wide to include the apparent movements among the fixed stars of the sun and the five planets which were known to the ancients. The zodiac was divided into twelve equal parts or "signs," each of which took its name from a characteristic constellation of fixed stars within the division. These signs were the Ram, the Bull, the Twins, the Crab, the Lion, the Virgin, the Scales, the Scorpion, the Archer, the Goat, the Water-carrier and the Fishes. The central line of the Zodiac is called the "Ecliptic," because the moon must be on this line for an eclipse to take place.

ZOLA, EMILE, *b.* 1840, *d.* 1902, the most prominent French novelist of the latter half of the 19th century, was the leader of the realistic school and did not scruple to narrate the most disgusting details of life in devotion to his cult. Of his many works, "La Debâcle," dealing with the disasters of 1870, and the trilogy, "Lourdes." "Rome," and "Paris," are characteristic of his strict but undesirable adherence to the unpleasant side of the truth.

ZOLLVEREIN, a customs-union of the various German States, formed finally, in 1867, to enable all the States to act as one in the arrangement of commercial relations with foreign countries, and to secure free trade among themselves.

ZOOLOGY is the study of the animal kingdom. Much of our zoological knowledge is due to the labour of the Greeks, but the microscope in modern times has given us a grasp of the subject not previously possible. In the lowest forms of animal life, as in the microscopic Amœba, we find the body composed of a speck of living matter, of gelatinous consistency, enclosing one specialised part, the nucleus, which controls the activity of the whole. Such a unit of living matter is termed a cell; Amœba is composed of a single cell, and yet it eats, breathes, moves and has its being like any other animal; it thus forms no link whatever between living and non-living matter. Its mode of reproduction is peculiar; as it gets old, instead of dying, first the nucleus and then the remainder of the cell divides into two equal parts, and in place of one Amœba we have two new ones; thus Amœba only dies naturally, by giving birth to two offspring. The higher animals, the microscope shows, begin their life as a single cell, which soon divides into two, just as Amœba does, but these two remain side by side, and dividing again and again produce a colony of cells which together form the body of the animal. Amœba, we note, has to be a Jack of all trades, one cell has to eat, breathe, move, and so on; but in the colony of cells which forms the body of a higher animal, division of labour occurs; the cells that form the muscles for instance, are capable of movement, but they are not concerned with digestion, whilst the cells forming the digestive system are concerned with some special part of the digestive process, but have nothing else to do. The animal kingdom thus falls naturally into the following groups:—**1. Unicellular Animals** (like Amœba), known also as *Protozoa;* and **2. Multicellular Animals,** known also as *Metazoa.* The *Metazoa* are divided further into two great groups:—(1) the *Cœlenterata* or Zoophytes, the bodies of which are composed of only two layers of cells, viz., an outer, sensory and protective, and an inner digestive layer; and (2) the *Cœlomata,* the bodies of which are composed of three or more, usually many more, layers of cells. The *Cœlenterata* are divided into the sponges, the anemones, and the jelly fish. The *Cœlomata* are divided into (*a*) the worms, (*b*) echinoderms or starfish, (*c*) molluscs, (*d*) arthropods, animals with jointed appendages, e.g. crustaceous insects and spiders, and (*e*) vertebrates. The study of the zoology of past ages, known as palæontology, has gained in interest since Darwin published his "Origin of Species" in 1859. We now know that fish were the first vertebrates to appear on the earth, and that they were succeeded by amphibia before the primary geological period had terminated; in the secondary geological period reptiles and the lower mammals made their appearance, and towards the close, birds also; the higher mammals have only been in existence since the tertiary period began, whilst man is of comparatively recent origin.

ZOOPHYTE. An animal of the sea-anemone class. See *Zoology.*

ZOROASTER, the founder of the religion of the Parsees, who flourished, according to Persian tradition, in the 6th century B.C. He seems to have been a leader among an agricultural people, whom he wished to establish in virtue, thrift, and industry. The Zend-avesta is in part attributed to his authorship.

ZOUAVES, a body of troops in the French army, consisting of picked infantry soldiers of fine physique and tried courage, whose uniform is a picturesque Algerian dress. Zouaves were originally a mixed Algerian and French body, the name being derived from that of a tribe of mercenaries whom the French employed in 1830, when they took over Algiers.

ZULUS, THE, a South African native people, whose territory formerly included Natal, but is now confined to a district of 10,460 square miles, with a sea-board of 210 miles, lying to the north of Natal. The Zulus are physically a fine race, and though prone to fighting, they are not resentful. They govern themselves on democratic lines, and are intelligent and liberal-minded. The Zulus, under Chief Tshaka, gained complete ascendency over the tribes from the Zambesi to Cape Colony in the early part of the 19th century. King Cetewayo succeeded to this kingdom in 1874, and the English declared war on him because his power menaced Natal. After a terrible reverse at Isandlana (1879), and the heroic defence of Rorke's Drift, the British columns retired to the Tugela River, but Lord Chelmsford's victory at Ulundi, 1879, brought the war to an end. Since then, Zululand has been incorporated partly with the Transvaal and partly with Natal.

ZURICH, a beautiful lake of Northern Switzerland, drained by the Limmat, a tributary of the Rhine. The lake is long and narrow, and at its lower end stands the town of Zurich, the capital of the canton. The town is quaint and interesting and of great commercial importance. The population, 150,000, has been trebled during the last 30 years.

ZUTPHEN, a Dutch town in the province of Guelderland, about 20 miles N.N.E. of Arnhem. Zutphen is of interest in English history as the scene of the battle in which Sir Philip Sidney was killed, 1586. (See *Sidney, Sir Philip*).

ZUYDER ZEE, a wide, shallow gulf of the North Sea, penetrating 60 miles into Holland, and formed in 1282 by an inroad of the sea which broke down the protecting sand-dunes. A chain of islands, the principal of which is Texel, marks the former coast-line. A great drainage scheme is proposed, to reclaim a large part of the Zee.

ZWINGER, a celebrated museum at Dresden, with a picture gallery containing the Sistine Madonna and numerous other famous pictures.

ZWINGLI, ULRICH, *b.* 1484, *d.* 1531, a great Swiss Protestant Reformer. He converted Zurich to his views while serving in the cathedral as a preacher, and soon the chief towns of Northern Switzerland joined him. The Catholic Cantons, however, formed a league against the Protestants, and Zwingli was killed in a sudden attack made upon Zurich. Zwingli was more broad-minded and generous than his contemporaries, Luther and Calvin, and he laboured as a patriot to establish a broad Christian union of the Swiss people. Although his views almost coincided with those of Luther, there was no hearty co-operation between them.

A MEDICAL DICTIONARY

FOR USE IN

THE FAMILY CIRCLE.

INTRODUCTION.

We venture to offer a few remarks to serve as a finger-post in directing the reader to the right use of this Dictionary of Medicine, which is not intended to supersede the doctor, but to indicate when he should be called in, and to act as a guide in emergencies when he is not immediately available, or in simple cases when his aid is not needed. Still more important than a knowledge of the means of recovering health, is that of preserving it. The writer has, accordingly, aimed at making this Dictionary a *Guide to Health*, by stating not merely the treatment to be followed in the various diseases, but by explaining their causes, and the way to avoid their incidence, especially by that most effective of all preventive measures, the maintenance of the general health.

Instead of the Science of Medicine occupying ground forbidden to the laity (that is, the general public), it should, in our opinion, form part of everyone's education. Ignorance of its principles is one of the chief causes of disease and the mainstay of the quack. It cannot be too clearly understood, however, that in the case of Medicine, knowledge must be carefully and cautiously applied, or we shall soon discover to our cost that sometimes "a little learning is a dangerous thing." But rightly applied, a little knowledge is highly valuable, and the purpose of this Dictionary is to supply such knowledge in a way that may prove useful in the home circle. Accordingly, we have described the symptoms of onset of the common infectious diseases, and given full directions as to the management of common ailments and the course to pursue in emergencies.

We would especially recommend any person who refers to this Dictionary without any definite object in view, to read first those articles which bear on the subject of *Hygiene*, and which will be found mentioned under that heading; and, then, those articles that deal with the question of personal health, such, for instance, as relate to the care of the skin, the use and abuse of alcohol, tea, tobacco, and the different articles of diet, the prevention of constipation, the use and abuse of exercise and physical training, the value of sleep, and the treatment of insomnia, as well as the causes and prevention of insanity, all of which are treated under their respective headings. And it is certainly highly desirable, if not absolutely a matter of duty, that everyone should be prepared to render efficient aid in the event of any sudden emergency. To qualify oneself for such a duty can only be satisfactorily achieved by a course of practical training in *First Aid*, but failing such training, the article under this heading will prove of material service if mastered before the time of action has come. Next in importance, perhaps, is the subject of *Nursing*. In most cases, the progress of the invalid towards recovery depends much upon the care of the nurse and her strict attention to the directions of the doctor. In most households the mother or daughter is sure to be called upon, sooner or later, to act as nurse to some member of the family. In the article on the *Sick-room*, she will find some hints that are sure to prove useful, and she may be glad of a few recipes for the common articles of invalid dietary given under *Cookery*.

May we here give a word of warning on the question of *Drugs?* Their sparing use is more and more insisted on by the medical profession, and certainly their constant use in unprofessional hands is to be strongly deprecated. Throughout the following pages we have given drugs a subordinate place, since we regard them as extremely liable to misuse. The layman would do well in the treatment of disease to secure for the patient in whom he is interested, careful nursing, rest, fresh air, and suitable food, leaving drugs, as a rule, to the physician. At the same time all householders, especially those living in the country, and remote from a doctor's residence, would find a few medicines, kept under lock and key, of great service in cases requiring prompt attention. (See *Medicine Chest.*)

In the treatment of disease, *Alcohol* should be regarded as a drug, and therefore to be avoided if possible. Much of the cheap "invalid port" used by the public as a tonic, turns out on analysis to be crude spirit coloured with elder wine; and also much of the cheap spirit on the market is baneful from its immature condition, or from the impurities it contains. But even when the wine or spirit is pure, the risk of establishing a craving for alcohol has always to be borne in mind by those who first resort to it to relieve some symptom which is likely to recur. This danger appears to be more serious in women than men. The same objection applies to many other drugs, and is one great reason for leaving them in the hands of the physician. Unfortunately, drug habits are too often met with at the present day; morphia, cocaine, nerve tonics, sleeping draughts, and even strong aperients play their pernicious part in the lives of their unhappy slaves. A word of warning must also be most emphatically given in regard to many "soothing syrups" and "teething powders" now on the market, which contain opium, a drug often fatal to infants. We can only

express regret that any preparation containing this powerful drug can still be sold without the nature of its contents being stated on the label.

We must also enter our protest against the reckless way in which infants are fed, and which is responsible for the very high infantile mortality that is a disgrace to our civilisation. The number of *Infant Foods* advertised is very large. The law permits any one to put anything into a "tin," and sell that as a "perfect baby food"; and this is permitted, whilst a good food like margarine can on no pretence whatever (and quite rightly), be sold under a false name. The contrast between the laxity on the one hand and the stringency on the other, would be ludicrous were it not so disastrous in its results to health and life, and so fraught with suffering to many thousands of helpless infants. In the first book that comes to hand we find among the advertisements ten referring to baby foods, eight of which imply, or definitely state, that they are suitable for infants of all ages. As a matter of fact, these eight foods are widely different in composition, and certainly at times harmful when employed in the indiscriminate manner that their claim to be "suitable to all ages" would seem to justify. The physicians of our Children's Hospitals have devoted much attention to this subject, and the outcome of their investigations is clearly the best guide that can be obtained. And this we have given in the table under *Infancy*, in which the more valuable of these foods are tabulated according to the latest results of medical research. In the article on *Food* we have referred also to many other preparations, often useful in invalid dietary.

On calling in a doctor to see a member of the family who shows signs of "sickening for something," do not expect him to say right off what the disease will turn out to be. As a rule, it is impossible to tell at the moment; few experts could tell until time had been given for further symptoms to develop. This fact cannot be too clearly apprehended, as people often unreasonably demand a *diagnosis* from their doctor, at the first visit, which it is impossible to give. Many illnesses begin in the same way; thus a bad cold in a child may be the beginning of measles or whooping-cough, or be nothing more than a nasal catarrh. Moreover, the same disease may have many different modes of onset. We find, for instance, amongst cases of pneumonia that have been under our care, that, on the first day of illness—according to notes made at the time—the symptoms were of seven different varieties:—

(1) shivering, (2) shivering with pain in the side, (3) pain in the side with vomiting, (4) vomiting and diarrhœa, (5) diarrhœa and pain in the limbs, (6) vomiting followed by delirium, (7) sudden loss of consciousness.

Again, we find no less than eleven different modes of onset in such a small number as twenty-five consecutive cases of German measles, occurring in the spring of the same year. The symptoms before the appearance of the rash were:—

(1) none whatever, (2) a small lump noticed behind one ear due to an enlarged gland (3) large lumps complained of at the back of the neck on both sides, also due to enlarged glands, (4) headache, (5) headache and sore throat, (6) headache, cough, and malaise, (7) shivering, vomiting, and backache, (8) severe backache, (9) aching in the limbs and enlargement of the glands in the neck, (10) nausea and giddiness, (11) malaise for a week without other symptoms.

In many of these cases there was no reason to suspect German measles until the appearance of the rash; and even then English measles was closely simulated by some of them, and scarlet fever by others, though the subsequent course of each case, and the occurrence of others of more typical character in the same house, left no doubt as to their nature. Such examples could be multiplied indefinitely, but enough has been said to show the folly of expecting to know the nature of an illness in its earliest stage. Meanwhile what is to be done? The answer will be found under *Sickening for an Illness*.

In conclusion, we wish to emphasise the fact that, even in the present imperfect state of knowledge, most forms of illness are preventable. Any person who studies the rules of health, and steadily carries them out, has a fair prospect of a long and healthy life; and even when visited by sickness, nature's power of repair is so great that recovery, in the majority of cases, may be confidently expected if only the disease be promptly treated. To ignore the danger-signals at the onset of an illness, is to commit an offence nature rarely pardons. Too often the value of health is only realised when it is lost. Simonides, it is worthy of note, put health first, beauty second, and wealth third, in their relative value to man; and Bacon tells us that "a healthy body is the tabernacle, but a sickly one the prison of the soul." Though importance of obedience to the laws of health is obvious, yet unfortunately, in consequence of our defective knowledge, the most rigid observance of those laws will not ensure exemption from some diseases of the utmost gravity, such as cancer. This fact can only be accounted for in one way, namely, our ignorance of some of nature's laws concerning health.

To aid *research work* is thus a pressing duty. The rate at which discovery can proceed depends primarily, no doubt, on the genius and industry of the research-workers themselves, and on the advance of knowledge in allied fields of science, but it depends as much and possibly more on the attitude of the general public. There is no lack of men anxious to engage in research, but want of private means forces the majority into other callings. It is for the public themselves to supply the necessary funds. It is within their power to create an army of research-workers that shall discover the secret of the problems now awaiting solution. Surely the home of Jenner, Lister, Hunter, and Harvey must not fall behind her continental neighbours, nor must all the triumphs of bacteriology be left to Japan. When we note the advances of modern surgery since the introduction of anæsthetics and antiseptics, and also when we see those great barriers to colonial expansion—malaria, yellow fever, and sleeping-sickness—at last in a fair way of being successfully coped with, we can look forward with confidence to the conquest of such foes as cancer, consumption, and insanity, with which we are still face to face. In Medicine, the unknown is not unknowable, as it may be in some other branches of human enquiry, and hence no sacrifice in time or talent, whether of gold or mental gifts, can be looked upon as wasted, if spent in the cause of medical research.

A MEDICAL DICTIONARY.

ABDOMEN. The abdomen or belly is the largest cavity of the body. It is bounded above by the thorax or chest and below by the two pelvic bones which meet in front. From the cavity of the thorax it is separated by the great muscle of respiration—the midriff or diaphragm. Laterally and in front it is enclosed by the lower ribs and abdominal muscles. Behind, it is supported by the spinal column. The organs contained within the abdominal cavity are the liver, which lies under the right ribs and extends across to the left of the "pit of the stomach" or epigastrium; the gall-bladder and gall-ducts lying beneath the right lobe of the liver; the stomach lying under the left ribs and extending across to the right, and having its smaller end situated in the epigastrium; the intestines occupying chiefly the central portions of the abdominal cavity; the pancreas or sweetbread lying behind the stomach; the spleen or milt situated to the left of, and in contact with the large end of the stomach; the kidneys, placed one on each side of the spinal column and under the last two ribs of either side; the bladder, which lies at the bottom of the pelvis; the female organs of generation consisting of the uterus or womb, the Fallopian tubes, broad ligament and ovaries. These organs are wholly, or in part, covered by a membrane known as the peritoneum, which when inflamed gives rise to the disease termed "peritonitis." The diagnosis of disease situated within the abdomen is often more difficult than that of disease situated in other parts of the body, and non-professional investigation will be of very little use. The means at the disposal of the physician in the investigation of abdominal diseases are more limited in their application than is the case with diseases in other parts of the body, and clinical experience is to a greater extent drawn upon. Alteration in the form and size of the abdomen; pain, with or without a rise of temperature, and especially if the pain be of a severe, acute, or sickening character, or of sudden onset, ought always to suggest the necessity of prompt medical assistance.

Protrusion of some parts of the abdominal contents through the abdominal walls gives rise to the condition known as rupture or hernia. Accidental wounds of the abdominal walls with resulting protrusion of the intestines should be dealt with by the application of a perfectly clean soft towel rung out of hot water, which should be kept in position until the arrival of the doctor. On no account should any attempt be made to replace the intestines before they have been examined for punctures or other injury by the medical attendant.

ABORTION. See *Miscarriage*.

ABRASION. See *Wounds*.

ABSCESS. A collection of purulent matter as the result of inflammation. Inflammation of a tissue may result in the rapid breaking down of the substance of the tissue and the formation of pus or matter, or it may take place slowly. In the former case we observe what is termed an acute abscess; in the latter a chronic or cold abscess. The breaking down of the tissue substance is effected by micro-organisms of which the matter is full. Abscesses may occur in almost any tissue of the body, and may discharge either internally or on the surface. If seated near the surface, the usual signs of inflammation will be observed, viz., redness, heat, pain, and swelling. If deeply seated, external manifestations are usually absent, pain of a deep, dull, throbbing character often being the chief symptom. The pain is due chiefly to the tension and pressure of the abscess-contents, relief being obtained as soon as the abscess is opened and the pus evacuated. Acute abscesses if not opened by the surgeon very soon discharge through an opening in the skin produced by ulceration; but when deeply seated, or situated beneath dense structures, they may "diffuse" their contents along the paths of least resistance, and often by so doing bring about considerable damage. As soon as it is certain that matter has formed, the abscess should be opened by the scalpel of the surgeon, Waiting until the abscess "breaks" is, as a rule, the cause of prolonged pain, and greater disintegration of tissue and constitutional disturbance. Until the abscess is fit to be lanced, the part should be put at rest, fomentations, or the moist heat of a bread or linseed meal poultice applied and some mild aperient saline taken. Chronic abscesses usually betoken some constitutional fault or failure of health, and require, besides local treatment, general or constitutional treatment. After an abscess has burst, or has been opened by the surgeon, the walls of the abscess fall together and healing takes place with rapidity. In some cases, however, healing is not complete, and a small track or sinus persists leading from the site of the original abscess to the skin-opening. In such cases the aid of the surgeon is required so that this little canal may be effectively closed.

ABSINTHE is an alcoholic drink containing wormwood. It is largely used on the Continent, where it is responsible for much permanent damage to the nervous system of its devotees.

ABSTINENCE. See *Alcohol*.

ACCLIMATISATION. See *Climate*.

ACETIC ACID in its strongest form is known as *glacial* acetic acid. In this form it acts as a caustic and is used to burn out warts. Under the name *dilute* acetic acid a watery solution is sold which may be used as a refreshing lotion to apply to the skin in cases of headache or fever.

ACIDITY. This is a form of indigestion, which is due to an excessive formation of acid in the stomach. The symptoms are heartburn and a rising of wind and of bitter stomach contents into the mouth. Relief is obtained by taking a teaspoonful of bicarbonate of soda in a tumbler of water.

ACIDS are chemicals which combine with alkalies and metals to form salts; they all have a sour taste and turn red litmus paper blue. See separate headings—*Acetic Acid*, *Phosphoric Acid*, &c.

ACNE. This is the name of the skin disease which is so common in youth. *The symptoms* are pimples on the face and back, which have black points in their centres known as "black-heads." If the pimple be squeezed, a little maggot-like body escapes from the black point, which is made up of fatty material derived from the oil glands of the skin. *The treatment* consists in the free use of hot water and soap, followed by rubbing in sulphur ointment and zinc ointment in equal parts, twice daily. The skin may be sprayed with a "vaporiser." The bowels should also receive attention.

ACNE ROSACEA is the flushing of the face and nose so often seen in those suffering from chronic indigestion or alcoholic intemperance.

ACONITE, a drug only safe in medical hands. See *Drugs*.

ACROMEGALY, a rare disease, the chief symptoms of which are gradual enlargement of the face, jaws, hands, and feet. It is due to disease of the pituitary body, a gland at the base of the brain.

ACUPRESSURE is a mode of arresting hæmorrhage by passing a needle beneath the bleeding point and then out through the skin, so as to compress the blood vessel between the skin above and the needle below. (Acus = a needle.)

ACUPUNCTURE is a mode of counter-irritation applied by inserting needles deeply into the painful part. It is used in sciatica.

ADDISON'S DISEASE is a rare disease named after its discoverer, Dr. Addison. The cause is disease of the suprarenal capsules. The symptoms are weakness of the heart, anæmia and bronzing of the skin.

ADENOIDS is the term applied to an overgrowth of the third tonsil which is situated at the back of the nose. This is common in childhood. *The symptoms* are nasal obstruction, which compels the child to breathe with the mouth open; the nostrils are not used and fail to develop, whilst the bridge of the nose is abnormally wide, thus separating the eyes more than is usual; the mental vigour is impaired and the child is backward and inattentive at school. The tonsils are usually enlarged also. This condition runs in families. *The treatment* is removal of the adenoids by operation; the tonsils can be cut at the same time.

ADIPOCERE is a wax-like substance formed in the corpse during decay.

ADULTERATION of food and drink is widely practised. The term includes admixture of some other body by way of fraud, and sometimes for the preservation or the improvement of the flavour of the original article. For instance, pure malt whiskey is largely blended, that is adulterated with crude spirit, in order to produce an article which the public like. The public are protected by the "Sale of Food and Drugs Act."

AERATED WATERS are prepared by pumping carbonic acid gas into water under pressure. When the water is poured out the pressure is relieved and an escape of gas results, which produces effervescence. Seltzer and "Soda Water" are examples.

AGE. In most animals the average age attained is five times the length of time occupied in full development. If we regard man as grown up by twenty, this makes a hundred years the natural age for death to occur. Rarely as this is attained, there seems no reason for regarding it as abnormal under favourable conditions. It is confidently hoped that increased knowledge of the laws of health, increased self-control and general prosperity will greatly prolong life. Age is a most important factor in determining susceptibility to different forms of disease. Scarlet fever, measles, whooping cough are in the main diseases of childhood; phthisis of young adult life; gout, apoplexy, cancer, of middle life; and chronic bronchitis of old age. The chance of recovery from most diseases is less in the very young and the very old than in the ages between these limits.

AGRAPHIA is inability to express one's thoughts in writing.

AGUE, or malaria, or intermittent fever, is a fever common in marshy districts in various parts of the world. Since the fens have been drained it has become extinct in England, though commonly met with in those who have returned from the tropics. *The cause*, which has been discovered recently, is a microscopic parasite living in the blood. Infection is spread by a certain species of mosquito, the *Anopheles*, which sucks the blood of a man suffering from malaria, and in doing so takes in the parasite also. The parasite lives and multiplies in the body of the mosquito and produces spores, which pass into the salivary glands. When the mosquito bites it discharges saliva to make the blood flow, and in so doing injects the spores of the malaria parasite into the person bitten, who then becomes a victim to malaria. So far as is known infection is only spread by the Anopheles, the grub of which lives in marshes and it is from this fact that marshy districts are malarious, and not, as formerly thought, because the marshes give off poisonous gas which causes malaria. *The prevention* of malaria is essential, if Africa is ever to be a white man's country. Organised attempts to destroy the Anopheles are now being made in many places. They consist in the draining of all small pools near the towns and in pouring oil on the surface of the larger ponds to kill the Anopheles in its grub stage. The inhabitants also protect their windows with fine netting to keep the mosquito out, and they avoid being out after sunset as much as possible, because the Anopheles only feeds by night. *The treatment* of malaria has long been known; quinine is the drug used, it acts by killing the parasite in the blood. By returning to a temperate climate re-infection with fresh supplies of parasites is avoided and the original ones gradually die off or are killed by quinine.

AIR is essential to life. If withheld death results within three minutes. Pure air is essential to health, and inattention to this elementary fact is responsible for more disease than any other cause. The air is composed of a mixture of gases, of which oxygen, nitrogen, carbonic acid gas or (as it is now called) carbon dioxide, and water vapour are the chief. Animals in breathing absorb oxygen and give out carbon dioxide and water, and also certain organic impurities. It is to the last of these that the odour of a stuffy room is due, not to the carbonic acid, which is comparatively harmless. Plants in a small degree breathe like animals, taking oxygen in and giving carbonic acid out, but when the sun shines their green leaves do just the opposite, they take in the carbon dioxide and break it up into oxygen, which is set free, and carbon, which is retained and built up into starch. By this interaction of plants and animals the composition of the air is kept essentially the same in all parts of the world and from one year to the next. The air of the mountains and of the sea-shore is rich in another ingredient, *ozone*, which is highly stimulating, and it is largely to this that mountain and sea owe their value as health restorers. Ozone is produced everywhere during a thunderstorm, the beneficial results of which are appreciated by all. The air of towns is often contaminated by street dust, composed of dried horse-dung, by smoke, and by the acid emanations from certain factories. These are sources of danger to the public health. The air of workshops is of great importance to the health of the workers, especially in regard to the amount of dust it contains, as inhaling dust for hours every day induces lung disease. Much good can be done by wise factory laws in connection with this matter. [Refer also to *Ventilation*].

ALBUMEN WATER is made by dissolving the whites of two eggs in a pint of water. This is a useful substitute for milk in the hand feeding of infants when they are suffering from diarrhœa.

ALBUMIN is the principal ingredient of muscle and blood. Many varieties are recognised by chemists, one of them forming the whites of eggs is known as albumen.

ALBUMINURIA. Refer to *Bright's Disease*.

ALCOHOL is a drug potent for good or evil according to the way it is used. As a food its value is very inferior to the sugar from which it is prepared, but as a stimulant its value is great. There are times when a stimulant of some kind is essential to life. There is no evidence that the daily use of alcohol with the meals in moderate quantity is harmful. On the other hand there is ample proof that it is unnecessary. Whilst the excessive use of tea or coffee is injurious to health, the evil effects of alcoholic excess are incomparably greater. Moreover, it must never be forgotten that alcohol often begets such a craving for itself as to deprive its victims of all self-control. Its use as a beverage, therefore, is always more or less dangerous and requires the greatest watchfulness. In short, we regard alcohol as an excellent stimulant, but we hold a stimulant should be used either seldom, or, if constantly, only in very moderate doses.

The abuse of alcohol consists in using it (1) too concentrated; (2) in too large amounts; (3) between meals; (4) as a substitute for a meal; (5) to "keep out the cold."

Instead of keeping out the cold it increases the loss of heat by bringing the blood to the surface. Nansen was aware of this, and in his Polar explorations allowed his men no

alcohol, with excellent results. As a substitute for food, nothing could be worse, it not only does not feed to any appreciable extent, but by stimulating exhausts the energies, and by its corrosive action on an empty stomach leaves the appetite worse than before.

As a medicine it has this great danger—that it can always be obtained and taken without a medical prescription; hence in the case of a symptom like neuralgia, that is apt to recur, the prompt resort to alcohol in ever-increasing doses is apt to result from its use on the first occasion.

We give a few of the chief alcoholic liquors with the percentage of alcohol they usually contain: whisky and brandy from 40 to 50 per cent.; gin about 40; port and sherry about 20; claret about 13; cider and strong ale about 6; and small beer about 2.

ALCOHOLISM is the effect produced by an overdose of alcohol. Acute alcoholism or drunkenness is produced by an overdose recently taken. Chronic alcoholism by repeated overdoses in the past. In women this condition is often acquired by secret drinking before it is found out, the grocer's licence being largely responsible for this. The symptoms are loss of memory, deterioration of character, especially in regard to the love of truth, carelessness in the personal appearance, hoarse voice, chronic cough, tremor of the hand on waking, morning sickness, dilated veins on the cheekbones and nose, finally delirium tremens or pneumonia, gout or Bright's disease may occur. The *treatment* of acute alcoholism is easy; of chronic, very difficult. In acute alcoholism the stomach should be emptied by an emetic and a dose of Epsom salts given. In the morning, two drops of tincture of capsicum in two tablespoonfuls of water followed by some soda water will be welcomed.

In chronic alcoholism a habit has been formed far beyond the power of the victim to break unaided. The best course, consequently, is to voluntarily enter a Retreat for Inebriates and to undergo treatment there for a year or more. Travelling with a medical attendant who is a total abstainer is also recommended. Hypnotism has been used but the results are uncertain. Raisins have been stated to relieve the craving for alcohol. Strychnine and other tonics are sometimes used. A large number of patent remedies are on the market, but as an analysis of fifty of these has shown alcohol to be often present in amounts ranging from 6 to 47 per cent., they are likely to do more harm than good.

ALIMENTARY CANAL is a general name for the whole food canal from mouth to anus. It is divided into the mouth, the pharynx or throat, the œsophagus or gullet, the stomach, the small intestine, the large intestine or colon, and lastly the terminal portion or rectum. The opening of the œsophagus into the stomach is the cardiac orifice, and that of the stomach into the intestine is the pylorus. Where the small intestine opens into the large intestine there is a valve—the ileo-cæcal valve guarding the orifice which only permits fluid to pass onward towards the anus. The large intestine presents an outgrowth just below the ileo-cæcal valve called the cæcum, which terminates in a worm-like blind extremity known as the vermiform appendix. [Refer to *Abdomen, Digestion, Appendicitis.*]

ALLOPATHY is a system of treatment in which remedies are given to counteract the morbid condition present. Thus constipation is treated by aperients, heart failure by stimulants, and so on. This method is the one in ordinary use and is intended to produce in the body a condition contrary to that of the disease; whereas Homœopathy is a mode of treatment in which the remedies used would produce in health the same symptoms as those of the disease they are intended to cure. [Refer to *Homœopathy.*]

ALMOND. There are two varieties—the sweet and the bitter almond. The former is edible, the latter poisonous, owing to the prussic acid it contains.

ALOES is a resinous substance obtained from the leaves of certain species of aloe tree. The majority of the patent pills contain aloes, but it is an undesirable aperient to use habitually, especially in the case of those suffering from piles.

ALTERATIVE is a medical term becoming obsolete, really used to cover ignorance. It was applied to those drugs which, while possessing no definite action, were yet supposed to possess the power of "improving the constitution."

ALUM is a powerful astringent, better not given internally, but is useful as a gargle in relaxed throat (two teaspoonfuls of the powdered alum with a little honey to the pint of hot water). Powdered alum may be used to apply to a bleeding part to check hæmorrhage.

AMAUROSIS. blindness due to nervous causes.

AMBULANCE. See *First Aid.*

AMMONIA, or spirits of hartshorn, applied externally in strong solution produces redness of the skin. It is used as a counter-irritant in certain liniments, e.g., compound camphor liniment. In dilute solution ammonia is soothing to the skin and is useful for insect stings. When inhaled it stimulates the heart, but it is irritating to the air passages. Hence smelling salts, which consist mainly of ammonia, must not be applied to the nose of an unconscious patient for long. Taken internally in the form of *sal volatile,* the heart and stomach are stimulated. It is thus useful for a fainting fit or to disperse wind. The dose of sal volatile is half a teaspoonful in water for an adult. [Refer to *Poisons.*]

ANÆMIA, literally "without blood," means poverty of the blood. One form, common in young girls, is named *chlorosis,* from the yellowish-green complexion it causes. *The cause* may be lack of fresh air and exercise, unsuitable diet and constipation or the presence of some constitutional disease such as phthisis, rheumatism, etc. *The symptoms* are pallor of the face, lips, and gums, lack of energy, shortness of breath, faintness, want of appetite, and often indigestion. *The treatment* consists in determining whether any constitutional disease is the cause, and if so treating this; if not, much can be done by rest, fresh air, attention to the bowels, and by a course of iron. Iron is best taken freely diluted by adding forty drops of the tincture of perchloride of iron to a pint of lemonade, drunk during the day after meals. The absence of the monthly loss should not be treated, as this will become normal when the general health has improved.

ANÆSTHETICS are drugs which produce insensibility to pain. General anæsthetics are those which produce insensibility of the patient, local anæsthetics are those which when applied to any one part produce insensibility to pain in that part without affecting the consciousness of the patient. The chief general anæsthetics are chloroform, ether and nitrous oxide or laughing gas. Quite recently a fourth general anæsthetic has come into vogue, viz., ethyl chloride. The danger of a general anæsthetic is much reduced when it is administered by a specialist. Two medical men or one medical man and a dentist should always be present. The giving of gas by a dentist in the absence of a medical man is unsafe, and should never be submitted to. Gas is the safest, chloroform the least safe, of the anæsthetics. Ether is the most unpleasant, but this unpleasantness can be much reduced by taking gas, followed by ether, before the effects of the former have passed off. After gas a patient is soon ready to walk home, which is not so after either chloroform or ether. The local anæsthetics include ice and salt, or the ethyl chloride spray, which produce numbness by freezing the part, and cocaine or eucaine, which when injected under the skin temporarily paralyse the sensory nerves of the part. These are useful for minor operations of short duration. On the continent cocaine has been injected into the spinal canal, and extensive abdominal operations have then been carried out without causing pain, but this method must be regarded as still in the experimental stage.

ANASARCA. See *Dropsy.*

ANCHYLOSIS is the adhesion of the two bones, which form a joint. The adhesion may be of a bony or a fibrous nature. In the former case movement of the joint is impossible, in the latter it is impaired and can be increased by massage and hot-air baths.

ANEURYSM OR ANEURISM is a tumour consisting of an artery that has yielded to the blood pressure within it and dilated. Aneurysms contain blood and pulsate with

each heart-beat. *The cause* is prolonged muscular strain in sufferers from gout, syphilis or intemperance. Hence it is common in middle-aged navvies, soldiers and sailors, and rare in women. It may also be caused by a wound of the artery, and many aneurysms have been thus caused by bullet wounds in the South African war. *The effects* of an aneurysm are pressure on the surrounding parts, which may cause much pain, and finally the artery may burst and cause sudden death from loss of blood. The treatment should be in medical hands.

ANGINA PECTORIS is neuralgia of the heart. It is most often seen in middle-aged men. *The symptoms* are a sudden seizure characterised by intense pain in the chest and down the left arm and by a fear of immediate death. The attack ceases as suddenly as it began. *The treatment* must be begun before the doctor arrives. Some hot brandy and water and sal volatile should be at once administered. If handy, the most effective is a glass capsule of amyl nitrite broken in a handkerchief, and inhaled. Sufferers from this disease carry these capsules in their pocket. Many great men, including John Hunter, have died during an attack.

ANIMAL MAGNETISM. See *Hypnotism.*

ANISEED. Two preparations are in use: aniseed water: *dose*, two to four tablespoonfuls; and oil of aniseed; *dose*, one to four drops on sugar. Aniseed is used to relieve flatulence.

ANKLES, WEAK. This is due to lack of tone in the muscles of the leg. The treatment is to develop the calf by walking upstairs on tiptoe, by skipping, and by other exercises combined with the avoidance of long standing and of such artificial supports as high-laced boots.

ANODYNE is a remedy that relieves pain, e.g., opium, hyoscyamus, or belladonna.

ANTIDOTES. Refer to *Poisons.*

ANTIMONY is contained in antimony wine, tartar emetic, James' powder and Plummer's pill. The drug is much less used than formerly, owing chiefly to its depressing effect on the heart. It is not safe except in medical hands. [Refer to *Poisons.*]

ANTIPYRETICS are means for lowering the temperature. Cold sponging and bathing do this much more safely than drugs do. The drugs which act in this way are antipyrine, antifebrin, phenacetin, quinine and alcohol.

ANTIPYRINE, known also as phenazone, is a colourless, soluble powder used in doses of three to twenty grains to relieve pain in neuralgia or to reduce high temperature. Phenacetin is a safer preparation for general use.

ANTISEPTICS are chemicals which check the growth of germs and so protect a wound from infection. [Refer to *Disinfection.*]

ANTISEPTIC SURGERY consists in the use of antiseptics in the treatment of wounds. This method, introduced by Lord Lister, has enabled surgeons to do much that was before impossible. It is now being superseded by *Aseptic Surgery*, in which an attempt is made to sterilise everything before the operation, so that no antiseptics are required for the wound because no germs reach it.

ANTITOXIN is the natural antidote to the poisons produced by disease germs. These poisons are known as toxins. In the process of recovery the blood becomes charged with antitoxins produced by the tissues. In certain cases, notably in diphtheria, this fact has been made use of in the treatment of disease. Horses are dosed with diphtheria toxin in steadily increasing doses until their blood becomes highly charged with diphtheria antitoxin. Some of the blood is then withdrawn, and from this the serum containing all the antitoxin is obtained. This serum is then injected into a patient suffering from diphtheria as soon as possible after the disease has been recognised. By this means the patient is provided with antitoxin before he has had time to produce it for himself, and thus much time is gained which often makes the difference between life and death. The mode of termination of the very mild and of the very severe cases is not altered, it is in the cases intermediate in severity between these that the value of antitoxin is so great.

ANUS OR FUNDAMENT is the outlet from the lower end of the bowel. This is kept closed except during an action of the bowels by a ring of muscle known as the sphincter. The anus is the seat of many troublesome affections, e.g., itching, piles, fissure, fistula and prolapse. These are treated under their respective heads. Rarely a child is born with the anus blocked by a membrane; this is imperforate anus. A surgeon has then to break through the membrane, or death from stoppage of the bowels must result. This point should be examined shortly after birth.

AORTA is the largest artery in the body. The outlet into it from the heart is guarded by valves, which in middle life are prone to become impregnated with lime salts and in consequence to be too rigid to act. Much extra work is thus thrown on the heart. This disease is known as *Aortic Regurgitation.*

APERIENTS, Refer to *Constipation.*

APHASIA is loss of speech. The most common cause is a hæmorrhage into the brain on the left side. This injures the speech centre and causes paralysis of the right side of the body.

APHONIA is loss of voice due to something wrong with the larynx or to hysteria. [Refer to *Laryngitis.*]

APHTHA. See *Thrush.*

APOPLEXY, OR STROKE, is caused by a blood-vessel in the brain breaking and allowing the blood to escape into, and to destroy, the surrounding brain substance. This accident is only likely in the case of those with arteries that are brittle from chalky material deposited in their walls and with sufficiently strong hearts to burst an artery thus made brittle. Hence, it is most common in middle-aged men who are gouty or intemperate and who lead active lives. The stroke most often happens after a full meal or during some fit of passion. *The symptoms:* a sudden loss of consciousness from which the patient cannot be roused; the breathing is noisy; the motions or urine are often passed; the limbs may be convulsed down one side and are usually limp on one side and stiff on the other. If recovery follows the mental power is regained in whole or part, but one side of the body is partially paralysed, the leg recovering before the arm, and the arm before the hand. The skilled movements of the fingers, acquired by special training, are the last to be regained, if ever.

In strokes down the right side the speech is affected. The eyes still act together after a stroke and the power over the bladder is retained, sensation also is retained even on the paralysed side. In two months' time, in most cases, the invalid is able to walk with the aid of a stick. *The treatment* during the attack consists in loosening the clothing round the neck and propping up the head and shoulders. Hot bottles may be applied to the feet, but they must be well protected by flannel for burns easily result. By turning the patient on his side the noisy breathing is often improved No stimulant must be given; this mistake is commonly made. Five grains of calomel should be placed on the back of the tongue.

The prevention of apoplexy can be effected by restriction of the diet and alcohol during middle age, together with the avoidance of such forms of exercise as involve sudden strains or great excitement, and by attention to the bowels. [Refer to *Cerebral Thrombosis.*]

APPENDICITIS is inflammation of the vermiform appendix. The disease was formerly called "peri-typhlitis." There is a pocket-like protrusion from the large bowel: the first part of this protrusion is large and called the cæcum, the terminal portion is narrow and round like a worm, blind at the far end, white in colour, three inches long, and containing a cavity that will only admit a stout bristle. This terminal portion is the vermiform appendix. (Vermiform means worm-like). By placing the hand in the upper part of the right trouser pocket the fingers are about over it. The cavity of the appendix secretes mucus or slime. If the outlet into the cæcum gets blocked, the mucus is pent up in the appendix and dries, to form a body formerly mistaken for a cherry-stone. It is clear that a cherry-stone cannot make its way into the appendix, because it only admits a stout bristle. In addition to the formation

of a stone from the dried mucus, inflammation in the appendix itself is set up at the same time. This may quiet down in a few days or it may go on to abscess formation. This abscess is apt to burst into the general peritoneal cavity and set up a fatal peritonitis. *The symptoms* at the onset are vomiting, pain at the navel, shivering and a rise of temperature. There has generally been constipation off and on for some time. The disease may occur in later life, our king, for instance, had it in the year of his coronation, but it is much more common in youth. *The treatment* is to go to bed and send for a doctor; and directly an abscess forms a surgeon will be required also. If the attack passes off without an abscess occurring, the advisability of having the appendix removed subsequently will have to be considered in order to prevent recurrence.

The disease is not new, but the advances of surgery have greatly increased our knowledge of it. The majority of cases of "peritonitis due to chill" in the past have been cases of non-recognised appendicitis which have gone on to general peritonitis. It is this that the surgeon can now prevent.

APPETITE, in health, is the best guide to the quality and to the quantity of food eaten, provided that this be taken slowly. In disorders of the digestive system the appetite is impaired. During the convalescence from fevers, and in those suffering from tape-worm or diabetes, the appetite is often increased. In anæmia, pregnancy, and some forms of insanity, the appetite is often depraved or perverted, that is to say there is a craving for unwholesome articles, like slate pencils or chalk. This depraved appetite is also found amongst certain savage tribes. The love of sugar, so common in childhood, should be encouraged, and the loathing for fat tolerated, as both are results of a normal appetite, but sugar should be allowed only at meals.

APPLE WATER is made by pouring a pint of boiling water over a couple of roasted apples and allowing the same to stand in a warm place for three hours; it is then strained and sweetened to taste. This is a pleasant beverage for the sick room. Baked apples, cored, and peeled, are also useful.

AQUA FORTIS is fuming nitric acid. See *Poisons*.

ARNICA is not used internally. Half a teaspoonful of the tincture to half a pint of cold water is a popular lotion for relieving sprains and bruises. Any virtue this lotion may possess is due to the water and spirit it contains, and not to the arnica, the latter having no effect.

AROMATICS are vegetable products of the spice group, which owe their properties to a volatile oil. Mustard, peppermint and cloves are examples. They stimulate digestion.

ARROWROOT consists of pure starch, and therefore must never be used to feed infants before they are six months old. It is often used in convalescence from illness, especially in cases of diarrhœa. It is generally served in the form of gruel which may be prepared as follows:—a teaspoonful is made into a paste with a little milk, and is then slowly stirred into half a pint of boiling milk and kept stirred for five minutes.

ARSENIC in the form of "Fowler's Solution" is largely used in the treatment of anæmia and many nervous disorders. It is not safe in non-professional hands. [Refer to *Poisons*.]

ARTERY is a blood-vessel that carries blood from the heart. It is only in arteries that the pulse can be felt. The name is due to a former belief that they carried air. This error arose from the fact that after death the arteries are found empty. And this is due to the fact that they empty themselves by their own elasticity into the veins.

ARTHRITIS means inflammation of a joint.

ARTIFICIAL RESPIRATION. [See *First Aid*.]

ASAFŒTIDA is a drug of nauseous taste, chiefly used in the form of pills for the relief of flatulence. It is contained in the compound galbanum pill and the aloes and asafœtida pill of the Pharmacopœia.

ASCITES. See *Dropsy*.

ASEPSIS is the absence of germs. The germs present on the skin and in dust render a wound likely to fester. Hence arose the antiseptic treatment, in which the surgeon, when operating, washed the wound with chemicals, termed antiseptics, to kill the germs that gained entrance. As an improvement it is now proposed to secure asepsis by destroying all germs that can possibly come in contact with the wound before operating; thus the skin of the patient is wrapped in antiseptic dressings the night before operation, the dressings to be applied are previously sterilised by heat, the instruments are boiled, and the surgeon's hands are enclosed in sterilised rubber gloves. During the operation there is then no need to use antiseptic lotions, sterilised water being alone used, and the wound thus escapes the irritation which antiseptics cause, and so heals more quickly. [Refer to *Bacteria, Antiseptics*.]

ASEPTIC SURGERY. See *Antiseptic Surgery*.

ASPHYXIA, literally without pulse, is the name of the condition caused by want of air. In such a case the oxygen which the blood contains is rapidly used up, leaving the blood of a dark colour. Hence the sufferer rapidly turns blue and then "black in the face." During this stage violent efforts to breathe are made, and the heart beats violently; soon exhaustion sets in, the heart fails and blueness gives place to an ashy pallor, unconsciousness comes on, convulsions if they have occurred cease, and death results in less than five minutes, unless the obstruction to respiration can be removed. [Refer to *First Aid*.]

ASTHMA is a disease characterised by paroxysmal attacks of difficult breathing. The disease may begin in childhood, but more often develops later in life, and is frequently associated with other diseases, e.g., chronic bronchitis, Bright's disease, or heart disease. When no other disease is present there is generally a history of nervous disorders in the family. The symptoms that precede an attack are variable, but often are like those of a bilious attack. The attack itself most often occurs at night; the sufferer awakes with a distressing sense of want of breath, the respiratory movements become violent, and in a few minutes the attack is at its height; in spite of the most strenuous efforts very little air enters the lungs and still less leaves them. Respiration is prolonged and wheezy; signs of insufficient oxygenation of the blood supervene, the face becomes livid and bedewed with sweat, the pulse small, the extremities cold. Finally, improvement gradually occurs and with a fit of coughing relief is obtained, and the patient sinks exhausted to sleep. The duration of an attack varies from a few minutes to a few hours, and several attacks may occur in the same night. Death during a paroxysm is almost unknown. *The treatment* during the attack is very varied, some remedies acting like a charm in some cases but not in all. A dose of sal volatile, the inhalation of the fumes of burning nitre paper, or of nitre mixed with stramonium powder, either burnt on a plate or made up into cigarettes, and the inhalation of amyl nitrite, are remedies widely used. Morphia relieves most attacks but should be avoided, lobelia is too depressing to be recommended. *The prevention* of asthmatic attacks consists in avoiding those particular causes which individual experience proves to excite an attack. These causes are most varied and peculiar. They include a heavy supper, constipation, anxiety or mental excitement.

ASTIGMATISM is a defect in vision due to the front of the eye not being of the right shape. A point must be focussed as such on the back of the eye to be seen properly. In order that this may occur the curvature of the eye in the horizontal plane must be the same as that in the vertical plane. When the two curvatures are unequal astigmatism is present. Points are then seen as lines unless the internal muscular mechanism of the eye is capable of correcting the error. Such correction commonly occurs, but it involves a muscular strain that often induces headaches and bilious attacks, and when the health is run down the correction is incomplete and the sight blurred. *The treatment* consists in measuring the difference between the two curvatures and then in ordering special glasses so made as to compensate for the error. All muscular strain within the eye is thus relieved, though the glasses may have to be worn a few days before the eye loses the habit of straining, hence at first

the patient can often see better without the glasses, and the impression is given that the glasses are unsuitable. It will be seen that trying on various spectacles at a shop is useless for the above defect, and that the eyes require an accurate examination by an eye specialist. [Refer to *Eye.*]

ASTRINGENTS are remedies which produce contraction of the tissues with which they are brought in contact. Cold, alum, tannin, and lead salts are examples. They are used to check hæmorrhage and excessive secretion.

ATAXY means partial loss of control over the muscles, which renders movements irregular and unsteady. The symptom is well seen in the reeling gait of a drunken man and in certain diseases of the nervous system. See *Locomotor Ataxy.*

ATROPHY means diminished nutrition, which causes wasting. All organs tend to atrophy if they are not sufficiently used, or if their connection with the nervous system is interfered with from any cause.

AUTOPLASTY is the method of repairing one part of the body with tissue obtained from another part, as in grafting skin from the arm on to a wound in the face.

AUTOPSY is an examination of the body after death. See *Post-mortem.*

BACILLUS is a germ shaped like a long thin rod. See *Bacteria.*

BACTERIA, or germs, are microscopic fungi. The number of species already known is so great that there are probably as many species in nature as there are different kinds of flowering plants. Just as in flowering plants we find some adapted to the water, the mountain, the valley, the equator or the poles, so amongst bacteria we find the same range of habitat, the same variety of usefulness or harmfulness to man, the same wide range from extreme vitality to comparative delicacy. Air, earth and water, our skin, our clothes, and our mouths are all tenanted by bacteria of this species or that. Fortunate indeed is it that most of them are harmless, for the few specially adapted for preying on man cause more suffering and premature death than almost anything else. Boils, gangrene, festering wounds, erysipelas, lockjaw, consumption, and the various infectious fevers are each caused by the ravages of a particular species of germ. Indeed so great a danger is only kept in check by a most elaborate system of defence; the germs as they gain entrance to the body are attacked by the white corpuscles, and their poisons are neutralised by the formation within the body of antidotes specially adapted to each. This means of defence extends far down the animal scale, becoming simpler and less efficient as the lower forms of animal life are reached. Plants enjoy a comparative immunity from the attack of bacteria, but only to fall a ready prey to numberless parasitic moulds. The production of disease, however, is the work of only a small section of the bacteria, of in fact a few aberrant forms specialised to a parasitic life. The chief work of bacteria is to cause putrefaction, without which life would soon be impossible, as we should be buried beneath the dead leaves and the dead animals of a former age. Another group help to make soil by fixing the nitrogen of the atmosphere and changing it to nitrates, which are a valuable manure. This kind live attached to the roots of clover and other leguminous plants, a fact which the farmer now turns to account in the rotation of crops. Others again tan leather, make vinegar and ripen cheese, though others turn milk sour and butter rancid, whilst yet others live in our intestines and aid in the digestion of food and in the removal of any excess that may be taken. In short, bacteria are good servants but bad masters. [Refer to *Disinfection.*]

BALDNESS. Every hair is being constantly formed in health from a papilla placed at the bottom of a pit in the skin known as the hair follicle. The various organs of the body age at different rates, and the hair follicle is one of those organs which ages first; it then ceases to develop hair, and when sufficient follicles are in this condition, baldness results. The health of the hair follicle is often disturbed by the ill-health of the body, and in such cases the hair is shed either temporarily or permanently, as after certain fevers; again the health of the hair follicle depends on that of the surrounding skin, and in those who suffer from dandruff; unless this be treated, baldness follows. The treatment of baldness is preventive; once the follicles have atrophied nothing can be hoped for from any remedy. Dandruff must be treated by strict cleanliness of the brush, comb and hair. The brush and comb should be washed daily in a strong solution of washing soda; the hair should be washed every night with a one in five hundred solution of perchloride of mercury in alcohol and water (equal parts). The hair should also be thoroughly dried after the morning bath. The bowels and the general health should be attended to, and heavy head-gear and exposure to a hot gas flame just over the desk avoided. When the hair has already become thin, growth may be stimulated by increasing the blood supply to the scalp with Tincture of Cantharides, one ounce, vinegar and rose-water, each three and a half ounces, rubbed in night and morning; or by Tincture of Cantharides, one drachm, ether, camphor and vaseline of each three drachms, rubbed in as an ointment at night. If soreness of the scalp occurs the remedy should be omitted for a night or two. Most of the patent remedies contain cantharides or camphor.

Bald Patches in children are usually due to ring-worm.

BANDAGES. See *First Aid.*

BANDY LEGS means the bending outward of the bones, both of the thighs and legs, in contradistinction to "bowed legs," which is the bending of the leg bones only. The deformity is due to rickets making the bones soft, and to allowing the weight of the body to be supported by these soft bones. [Refer to *Rickets.*]

BANTING is a method of treating corpulency by a special diet consisting of an excess of nitrogenous food and a great restriction of the carbohydrates, that is, meat, eggs and cheese are eaten in excess and bread, potatoes, sugar, beer, champagne and cocoa are taken in the smallest possible quantity. In many cases good results, but in others the work thrown on the kidneys is too much for them, and serious harm ensues. The treatment should therefore be in medical hands. The name is derived from that of a man who treated himself for corpulency with success by means of the above method.

BARBADOES LEG is a form of elephantiasis, characterised by a chronic enlargement of the leg. See *Elephantiasis.*

BARK is the popular name for the cinchona bark, from which quinine is prepared. See *Quinine.*

BARLEY WATER. (1) *Clear.* Two ounces of pearl barley are to be well washed and then blanched by placing in a saucepan of cold water, bringing to the boil and straining. The blanched barley is then placed in a jug and a pint of boiling water poured on it; when cold the mixture is strained, flavoured with vanilla or lemon and sugar, and used as a refreshing drink. (2) *Thick.* Two good teaspoonfuls of blanched barley are boiled for twenty minutes in a pint of water in an enamelled saucepan and then strained. The fluid thus obtained is the barley water used for diluting milk in the artificial feeding of infants.

BARRENNESS may often be remedied, and the doctor should therefore be consulted.

BATHS for domestic purposes may be made either of metal or earthenware; earthenware presents the disadvantages that it absorbs a great deal of heat and that it is very slippery. Cold baths have a tonic effect, hot ones a soothing influence; hence a cold bath in the morning and a hot one at bedtime is the natural arrangement. For many people, however, the cold bath is found too severe, as they do not obtain the warm invigorating after-glow that is normal, but are chilled for some hours. In such cases the better method is to sit in a warm bath and with a large sponge douche the head and back with cold water for a few minutes, and to follow this by a brisk rub down. In all children this method is found better than the simple cold bath. The hip bath used warm is useful at the monthly periods, when the cold bath for the time should be discontinued. A salt bath, which is more invigorating than fresh water, may be made by adding four pounds of salt to every sixteen gallons of water used; sea-salt is on the

market, but ordinary table salt is just as efficient. In nursing the *sick*, different forms of baths are widely used. A bath is cold below 70° F., tepid between 85° and 92° F., warm between 92° and 98°, and hot between 98° and 110°. In bathing helpless patients they may be lowered into the bath, which has been prepared at the temperature ordered; for this purpose a blanket is much safer than a sheet as the latter may tear. After the bath they should be dried with towels previously warmed, wrapped in warm blankets and put back to a bed containing hot bottles. Hot baths are generally used to promote perspiration, for which purpose the heat may be applied as hot air, steam, or hot water, and their efficiency stands in this order. To give a *hot air bath*, the bed is prepared by covering the mattress with a waterproof sheet and a blanket, and the patient by stripping him and rolling him in a blanket. A long bed cradle is then placed over the patient, and is used to support more blankets so as to leave an air space between them and him. The air space is shut off from the exterior except at the foot of the bed, where the end of a funnel, heated over a special lamp, is placed. The funnel thus conveys the air heated by the lamp into the bed. The temperature is taken by a thermometer placed in the bed and the heating continued until the temperature ordered has been reached, it is then kept at this level for the time directed unless the patient becomes faint, when the lamp is withdrawn and a stimulant administered. The temperature commonly used is 150° F.; it will be found the bedclothes begin to scorch about 180° F. To give a *vapour bath*, the same preparations are made, except that the funnel is replaced by a steam kettle. The temperature that can be borne is much lower, 110° to 115° being about the limit. The time these baths are used is generally twenty minutes, after which the patient is rapidly rubbed dry and clad in warm flannel. Modifications of the vapour bath are the hot and the wet pack. To give a *hot pack* the bed is prepared as above, and the patient first stripped and then rolled in a blanket wrung out of boiling water, covered with a mackintosh sheet and one or more blankets and left for twenty minutes. In other words, a fomentation is applied to his whole body, and the perspiration thus caused is often great. A *wet pack* is given by wringing out a sheet in cold water and wrapping the patient in this, and again covering with a mackintosh and blankets. In this method the initial chill is followed by reaction and perspiration. The hot pack is most often used in disease of the kidney, and the wet pack to calm the nervous system and secure sleep in St. Vitus's Dance. *Cold Baths* are used in lowering the temperature in certain fevers, notably typhoid. The patient is lowered in a blanket into a bath at 90° F., and the temperature of the water then reduced to 70° F. by the addition of cold water. [Refer to *Typhoid.*] Cold is also applied by tepid sponging, and by the *cold pack*, which is given by wrapping the patient in a sheet wrung out of tepid or cold water, leaving him without further covering, and either changing the sheet for a fresh cold one every few minutes or chilling it by sprinkling it with cold water from the rose of a garden watering-pot. The length of time this treatment is continued is usually governed by the effect on the patient's temperature, which is taken at frequent intervals; if the temperature has fallen two degrees it may be expected to fall at least two more after the pack is discontinued. *Medicated Baths*, which consist of water with some chemical added, are often used. Those most often ordered are a mustard bath of a strength of twelve ounces of mustard to sixteen gallons of water; bran baths, for eczema, made by placing four to eight large handfuls of bran in a muslin bag and suspending in a hot bath; if the bran be not enclosed in a bag, the waste pipe will be blocked; oatmeal baths are prepared in the same way; alkaline baths by adding two ounces of washing soda or three of borax to the bath; sulphur baths by adding three ounces of sulphur and three of sulphide of calcium to the bath. Mud baths can now be obtained at Brighton as well as at Marienbad. *Turkish Baths* are often useful, but as a substitute for exercise in the fresh air they are bad and some complaints are unsuited to them, so that they are not recommended unless taken by medical advice.

BATTLEY'S SOLUTION. See *Opium.*

BEDROOM APPLIANCES. See the *Sick Room.*

BED-SORE is due to the death of the skin at a point exposed to prolonged pressure during confinement to bed. The pressure, by hindering the blood supply, reduces nutrition at this spot and normally relieves itself by causing a change of posture, but in the paralysed or in those exhausted by a long illness it does not do so, and the skin becomes first starved and then killed. Bed-sores are preventable by skilled nursing. The bed must be kept smooth and free from crumbs. The patient's skin must be kept dry and clean, and all parts exposed to pressure or to soiling with discharges, must be washed frequently with oatmeal water, well dried, rubbed with methylated spirit and then dusted with a powder made of zinc oxide and starch in equal parts. In very frequent diarrhœa or incontinence of urine the skin should be protected by zinc ointment. The appearance of the bed-sore is preceded by that of a red pressure spot; this should be constantly watched for and as soon as it is detected a water bed or a water ring pillow is required so as to relieve the pressure, and at the same time the spot should be painted with collodion. After the sore has formed, it should be dressed with an ointment composed of zinc ointment and castor oil in equal parts, and all pressure taken off it by means of a ring pillow. If the sore becomes gangrenous the separation of the dead part should be aided by boracic fomentations applied four-hourly.

BED-WETTING. See *Bladder.*

BEEF TEA. Remove all fat and skin from a pound of shin of beef; put it in a jar with a pint of cold water and a quarter teaspoonful of salt. Then place in a moderate oven and allow it to simmer only for three hours; strain and skim off all fat with paper and serve hot. A hot and palatable fluid is thus obtained which is stimulating but not really nourishing. During convalescence the addition of celery, carrots and other vegetables to the meat is recommended. Somatose, or Brand's essence, may be added, nourishment being thereby given as well as a stimulant. The addition of the juice of one green and rather sour grape to a bowl of beef tea alters the flavour pleasantly when the patient tires of the ordinary form.

BEER is nominally prepared from malt by fermentation, and by the addition of a solution of hops, but in reality much of the beer on the market consists of alcohol prepared from sugar, which is manufactured from rags or sawdust, and to which various cheap bitters have been added. It was in the sulphuric acid used in the manufacture of sugar that the arsenic was accidentally introduced, which caused the outbreak of arsenical poisoning in the Midlands during 1901. Much of the chemical beer is wholesome enough, but it seems only fair that the public should know when they buy it. Beer, when light is a wholesome dinner drink, because the bitter it contains stimulates the stomach, and the alcohol is in weak solution, 2 to 4 per cent; the sugar it contains, however, is not only fattening but disagrees with the digestion of many people, while the hops promote sleep, which makes beer unsuitable for lunch in many cases. Lager beer contains less alcohol and is often borne when the heavier beers are not, but the gouty and those liable to gravel should avoid beer entirely. The stronger ales contain about 6 per cent. of alcohol.

BELLADONNA is a drug, containing the alkaloid atropine, derived from the deadly nightshade. Belladonna plasters or glycerine may be applied externally for the relief of pain, or to check the secretion of milk. The internal administration of the drug should be left to the doctor only. [Refer to *Poisons.*]

BELL'S PARALYSIS is a paralysis of the facial nerve, named after Sir Charles Bell, who investigated the functions of this nerve.

BELTS to support the abdomen are valuable in pregnancy, corpulency and in rupture of the navel. Indigestion and constipation are at times relieved by their use. They should be made of suitable material, perforated for ventilation, and provided with lacing rather than elastic.

BERI-BERI is a disease characterised by progressive paralysis. According to Professor Osler it is known

to have occurred in the Roman army in 24 B.C., and the Chinese alluded to it in the second century, A.D. Epidemics occur from time to time in ships, gaols and asylums, and these places are then capable of infecting healthy persons, although direct infection from the sick to the healthy scarcely ever occurs. Though most common in the Malay Archipelago, serious outbreaks have occurred in the Japanese navy, in the fishing fleets off Newfoundland, and in the Richmond Asylum of Dublin. The cause is unknown, but bad hygiene, especially the prolonged use of bad rice and of fish, seems an important factor.

BILE is produced by the liver, stored till required in the gall bladder, and poured into the small intestine during digestion by being forced down the bile duct by the contraction of the gall bladder. About two and a half pints are formed daily. Bile in carnivorous animals is generally golden and in herbivorous animals green in colour, whilst in man it is either yellow, brown, or green. It is alkaline, and its chief function depends on this property, for it neutralises the acidity of the stomach contents when these are passed into the small intestine, and thereby enables the pancreatic juice to act. Its colouring matter is derived from the blood, and is in part discharged in the fæces, and in part reabsorbed and discharged in the urine. The normal colour of urine and fæces is derived chiefly from the bile. If the bile duct be blocked the bile cannot escape and is reabsorbed into the circulation and carried to all parts of the body, causing jaundice. When the bile is too thick and the bile passages chronically inflamed, the bile may solidify and produce stones known as gall-stones or biliary calculi. [Refer to *Colic, Jaundice, Liver.*]

BILIOUS ATTACK is a popular name for *migraine.* Migraine is not really dependent on disorder of the liver. The symptoms are headache, defective vision and vomiting of a few hours' duration only. The causes are eye-strain combined with excessive mental work and lack of exercise. In vomiting the stomach contents are expelled first, and then if vomiting is repeated, the contents of the small intestine are brought up and as these are bile stained, the liver was regarded as the cause of the symptoms. In reality it is a disturbed circulation in the brain which causes the headache, defective vision and vomiting. The *treatment* should be to go to bed in the dark and sip some hot tea, and after the vomiting is over to sleep. If attacks are frequent, the eyes should be tested and suitable spectacles worn if any defect is detected, plenty of fresh air, exercise, and plain diet should be secured, and reading in a bad light or in a railway train avoided. The term is also used to denote an attack of indigestion, due to disordered liver. Nausea, headache, pale motions, and high coloured urine are the chief symptoms. The treatment is a free purge and spare diet, followed by more exercise and fresh air.

BINDER. See *Childbirth* and *Infancy.*

BIRTH-MARK or nævus, is a patch of dilated veins and capillaries in the skin, which produces a port wine-like stain. As they can be destroyed by the surgeon and are apt to spread if left, advice should be sought early.

BISMUTH is a valuable remedy in certain cases of dyspepsia. In the form of the carbonate or subnitrate, it is a heavy, white, insoluble powder, largely used in the treatment of dyspepsia, specially when due to gastritis or gastric ulcer. The oxide and the subnitrate are also employed as dusting powders in the treatment of eczema and similar conditions of the skin. The subnitrate of bismuth may be snuffed up the nose to relieve a cold in the head.

BITES of insects should be treated by the application of dilute ammonia, failing this, a strong solution of washing soda or the blue bag should be used; dog-bites are best touched with silver nitrate or caustic potash and then dressed with boracic ointment. [Refer to *Snake-Bite.*]

BITTERS all stimulate the flow of gastric juice and so increase the digestive power at the time, but their continued use may result in diminished digestive power. Some bitters also act after their absorption into the circulation, but they then act in ways peculiar to each, thus hops promote sleep and strychnine wakefulness. The common bitters are hops, quassia, calumba and gentian.

BLACK CURRANT WATER. Allow two tablespoonfuls of black currant jam in a quart of water to simmer for half an hour, and then strain; when cold it forms a most refreshing drink.

BLACK DEATH. See *Plague.*

BLACK DRAUGHT is composed of Epsom salts, senna, liquorice and cardamoms. The dose is 1—2 fluid ounces for an adult. It is a useful aperient, taken before breakfast, but it is nauseous.

BLACK DROP. See *Opium.*

BLACK EYE is due to rupture of the small blood-vessels of the eyelids and to the escape of blood into the surrounding tissues. The escaped blood undergoes chemical changes which alter its colour and in time it is absorbed. The process may be hastened by applying hot fomentations. For the first few hours, cold should be applied to check the escape of more blood. The beef steak so often used only acts by virtue of its coldness, and a handkerchief applied to the eye and kept moist with cold water acts just as well.

BLACK HEADS See *Acne.*

BLACK VOMIT is due to a broken blood-vessel in the stomach. The patient should be placed on a sofa or the floor and kept as still as possible, while a doctor is sent for; all tight clothing round the body should be loosened and a bag of ice may be placed over the stomach unless the patient is collapsed. A little ice may be allowed to suck.

BLADDER, GALL, is a small bag attached to the bile duct to receive bile and to store it until required.

BLADDER, URINARY, is a bag with muscular walls, situated deeply within the pelvis and having three openings, two above, which give entrance to the two ureters or tubes connecting the kidneys and the bladder, and one below, which gives exit to the urine by opening into the urethra. The function of the bladder is to retain the urine that it receives from the kidneys continuously, and to discharge the same at intervals. The exit from the bladder is guarded by a sphincter or muscular ring, which by contracting keeps the urine pent up in the bladder. When water is passed the bladder contracts and the sphincter relaxes. The bladder is under the control of the will to some extent, but when sufficiently distended, involuntary passage of urine normally occurs, though in many adults the urine can be held longer than is good for the bladder. Any quantity above a pint overdistends the bladder and does harm. In nursing unconscious or delirious patients the bladder must be constantly remembered. If urine is not passed four-hourly, the doctor should be summoned, and the bladder relieved by artificial means. Again, if the urine trickle away continuously medical aid is also required, as this symptom is often due to an overdistended bladder relieving itself imperfectly; too often in such a case the doctor is told that the patient is passing water freely, and is sent away with the impression that all is well.

Bladder, Irritable, causes inability to hold the water for the normal length of time, especially at night. The causes are numerous: the urine may be too acid, a stone may be present in the bladder, worms or polypi in the bowel may be the cause, circumcision may be required, or the nervous system may be at fault from over-pressure at school, fear, or at times from epileptic fits occurring at night. Parents should bear these facts in mind, as many of the cases finally brought to the doctor give a history of repeated punishment for wetting the bed, an act over which the wretched child had no control whatever.

Bladder, ruptured, is a rare accident generally due to a blow on the abdomen when the bladder is full, and at times due to retention of urine. The chance of recovery is slight.

Stone in bladder causes pain just after the bladder has been emptied and when the body is jolted; blood and slime in the urine; frequent passage of water, and at times stoppage of the water owing to the stone getting over the outlet and plugging it. The treatment is surgical.

Stoppage of the water is a serious accident requiring prompt

treatment. In childhood it is most often due to stone, in middle age to stricture; and in advanced life to an enlarged prostate. Before the doctor comes, the patient should be given a soap and water enema and be placed in a hot bath, when he may either pass water in the bath or when the bowels act. In the subjects of stricture or of enlarged prostate this accident is best prevented by avoiding alcoholic excess and chill. [Refer to *Stricture* and *Prostate.*]

BLANC-MANGE. It is useful during convalescence. To make it take cornflour two ounces, milk a pint, sugar one ounce. Mix the cornflour into a paste with a little cold milk and when the rest of the milk boils, stir in the cornflour and boil until the original quantity has been reduced by two-thirds; add the sugar and pour into a mould and allow to set.

BLAUD'S PILLS contain carbonate of iron, and are used in the treatment of anæmia. The dose is one to four after each meal. They disagree with many people, causing headache and constipation, and thus should only be taken by medical orders. Moreover, the majority of the ready-made Blaud's pills on the market are valueless, as the carbonate of iron rapidly degenerates into insoluble rust, and the pills must, therefore, be freshly prepared to have any medicinal value. Some makers colour the pills green, so that however long they are kept they still look on section to contain the green carbonate of iron, which in reality has long since changed to useless rust.

BLEACHING POWDER, or chlorinated lime, is used as a disinfectant for drains. It owes its value to the chlorine which it gives off. See *Disinfection.*

BLEEDING is now rarely performed, but is useful in cases of heart failure with blueness. [To arrest bleeding see *First Aid.*]

BLINDNESS is caused by injury or disease of the eye, or of the optic nerve which puts the eye in communication with the brain, or of that part of the brain concerned in vision. The chief cause amongst diseases of the eye is cataract, whilst the chief amongst disorder or disease of the brain are migraine, hysteria and cerebral tumour. Of these blindness due to migraine or hysteria are only temporary. *Colour-blindness* is due to a defect of the nervous structures of the eye, which causes inability to distinguish certain colours. The commonest form is that in which red and green are confused. [Refer to *Cataract.*]

BLISTER is a collection of fluid under the superficial skin. Its causes, which are numerous, include pressure, heat, chemical irritants and certain diseases, e.g., chicken pox and shingles. To *raise a blister* cantharides is used either in the form of a plaster or fluid. The skin should first be washed, and if fluid is to be used the surrounding skin should be protected by ointment. The fluid is then painted on and covered by cotton wool secured by strapping. If a plaster be used this is loosely strapped on. After an hour the blistering plaster or fluid should be removed and a poultice applied if the blister has not risen. After a blister has risen, whether its origin be due to accident or design, it should be snipped with clean scissors, the fluid dried by cotton wool and boracic ointment applied on linen. Blisters should not be applied over bony prominences or acutely inflamed skin, and are not used as often as formerly, except in the treatment of chronic inflammation of the joints. Flying blisters are those in which the plasters are removed as soon as redness has been produced.

BLOOD contains all the bodies required by the tissues as food and all the waste products which the tissues throw off. It consists of a fluid basis, the plasma or liquor sanguinis, in which float small microscopic bodies of two kinds, the red corpuscles and the white corpuscles. The red corpuscles are disc shaped and owe their colour to the possession of hæmoglobin, a chemical body containing iron, the function of which is to combine with oxygen in the lungs and to carry this to all parts of the body. The colour of oxy-hæmoglobin is scarlet, that of hæmoglobin deprived of its oxygen is bluish-purple, so that blood just left the lungs is scarlet, while blood returned from circulating in the body elsewhere is purple. The white corpuscles contain no hæmoglobin and their function is different: their use is to attack, to enclose and to destroy by digestion all foreign bodies in the blood, especially disease germs. They possess the power of independent motion and can leave the blood-vessels and attack germs situated in the surrounding tissues [Refer to *Inflammation*]. The blood is always alkaline, though in some diseases less so than in normal blood, thus the term acidity of the blood has no foundation in fact. The amount the human body is estimated to hold is five quarts, one half of which can be lost before death is inevitable. On exposure to the air or to any rough surface, blood solidifies to a jelly with a liquid residue, just as milk when curdled turns to curds and whey. This solidification, which is known as clotting or coagulation, is the natural process of stopping loss of blood from a wounded surface. Certain people suffer from a lack of this power and are known as "bleeders or hæmophilics" because the slightest wound gives rise to most prolonged bleeding. This defect is hereditary, being passed on from mother to son, the mothers presenting no symptoms and yet transmitting it to their sons, who suffer from the disorder all their lives. The danger of blood clotting is that when a blood-vessel becomes rough in its interior a clot is apt to form and so to block the blood supply to the area supplied by this vessel; many strokes and also gangrene in old people are thus caused.

BLOOD, LOSS OF. See *First Aid.*

BLOOD, POVERTY OF. See *Anæmia.*

BLOOD POISONING is a general term for any of three conditions, viz., sapræmia, pyæmia, and septicæmia. In the first the blood is poisoned by the absorption of the poisons produced by germs that have not entered the circulation: in the second by germs that are carried to some distant organ and there deposited, producing an abscess in this organ, which is usually a joint, the lung or the liver; in the third by germs that have invaded the blood and are actively multiplying therein. In all three cases the source of infection is some septic focus, such as a festering wound or a suppurating tonsil. The gravity of the affection is in the order stated. The *treatment* is to support the patient's strength with stimulants and easily digestible food, to remove the septic focus, to promote the discharge of the poison by keeping the bowels loose and to attempt to destroy the germs by the injection of anti-streptococcic serum. Such treatment requires medical supervision.

BLOOD-VESSELS are of three kinds, (1) those which carry blood from the heart, which are named *arteries*; (2) those which carry blood back to the heart, which are named veins; and (3) thin walled and microscopic vessels connecting arteries and veins, which are called *capillaries.* In the capillaries the fluid part of the blood leaks into and nourishes the surrounding tissues.

BLOWS over the *stomach* often produce shock, which should be treated by rest, warmth and a stimulant. Blows on the *head* often produce a cut in the scalp so clean and straight as to resemble a knife cut. If severe, a blow may only stun or may cause a fracture of the skull as well. In the latter case the symptoms are those of a man dead drunk, and a mistaken diagnosis of this nature is often made. From this condition of stupor the patient may rally or he may sink and die. If he rallies he will first vomit, then groan, and gradually regain consciousness, and will be very irritable for a few days, whilst his memory may be disturbed for months. The *treatment* is to put to bed and stimulate gently at first, and after the patient rallies to check the subsequent reaction by calomel, a milk diet and strict quiet. A long holiday before resuming work will be requisite.

BLUE OINTMENT is composed of metallic mercury, lard, and suet. When spread on flannel and worn next the skin, the mercury is absorbed. Mercury is often administered in this way. It is also used to promote the absorption of inflammatory swellings situated near the surface.

BLUE PILL owes its value to the metallic mercury it contains. The dose is 4—8 grains for an adult. It is a strong aperient, to be used with caution. Calomel is

more frequently used at the present day. Either remedy should be taken at night and followed by a saline aperient before breakfast.

BLUSHING is one of the modes by which emotions are expressed. Joy and shame are most commonly attended by it, anger usually causing pallor. The blush is due to a temporary relaxation of the muscular coats of the blood vessels in the skin of the face, neck, and chest, whereby the vessels are dilated nd flushed with extra blood. A similar relaxation of the vessels may be produced by many causes, e.g. exposure to the sun, dyspepsia, alcohol, amyl nitrite, and many drugs, the condition then being termed flushing.

BOILS are abscesses in the skin. They contain a central core formed of a fragment of dead skin. The cause is debility combined with some local cause, such as the chafing of a collar. They are best treated by lancing and touching the interior with pure carbolic and not by the application of a linseed poultice, as this is apt to induce a crop of boils in the surrounding area. The general health should also receive attention, especially in regard to diet, fresh air and regularity of the bowels. The popular belief that boils throw off impurities from the blood has no foundation in fact.

BONES are adapted to form a framework capable of transmitting weight, of giving attachment to powerful muscles without bending, and in certain cases of protecting the organs they enclose, e.g. the brain or the heart and lungs. They develop either from gristle or from membrane, and some bones, e.g. the collar-bone from both; and differ from other organs of the body chiefly in the high percentage of mineral matter they contain. They consist of about two-thirds mineral matter, which is mainly chalk and phosphate of calcium, but in advanced life the percentage of mineral matter is higher and the bones in consequence more brittle at this time. In certain cases the bones are lightened by containing cavities full of air, thus the upper jaw is hollow and communicates with the nose. In birds this arrangement is present in nearly all the bones. The long bones, e.g., those of the arm or leg, contain marrow cavities. These contain in the child a red marrow that is concerned in the making of blood, but after growth is over the red marrow is largely replaced by yellow marrow. composed merely of fat. [Refer to *Broken Bone.*]

BONE DISEASE may be acute or chronic. In *acute bone disease* the membrane which covers them, known as the periosteum, becomes infected by a virulent germ and acutely inflamed, and at times this infection spreads through to the marrow within, when a condition known as osteo-myelitis is present. The symptoms produced are those of an acute fever and of intense pain and tenderness in the affected bone. The patient is usually a child. The treatment must be a prompt resort to surgery, or death from blood-poisoning will follow. When death of a bone as a whole occurs, "necrosis" is said to occur, but when an exposed bone dies on the surface only "Caries" is the term used. *Chronic bone disease* is most often due to the tubercle bacillus; this invades certain bones, especially those of the spine, ankle, knee and wrist, dissolves away the mineral matter and causes the bone to be replaced by a spongy tissue which soon breaks down into a cold abscess. The bone then crumbles and the cold abscess gradually makes its way to the surface; in the spine the deformity that results is the familiar hunch-back. [For treatment refer to *Spinal Disease.*]

BOOTS should have low heels, plenty of room at the toes, a flexible sole and no elastic sides. Boots need not be made with square toes in order to give the toes room, but the inner border should be as nearly straight as possible. Bunions, corns, hammer-toe and flat-foot are mainly caused by unsuitable boots.

BORAX is chiefly used as a mild antiseptic. The preparation known as honey of borax is a useful application to the mouth and gums in thrush and allied conditions. Glycerine of borax also makes a good mouth wash, if it be diluted with water seven times and ten drops of tincture of myrrh are added to each ounce of the mixture. An ounce of borax dissolved in half a pint of water makes a lotion that often relieves itching of the skin.

BORIC ACID is a mild antiseptic. A saturated solution of the acid in water may be used for washing wounds, whilst a teaspoonful of the acid to the pint of warm water forms an eye lotion useful in all cases of inflammation of the eye-lids.

BOWELS. See *Diarrhœa; Constipation; Stoppage of the Bowels* and *Inflammation of the Bowels.*

BRAIN is enclosed by the skull, between which and the brain are three membranes and a layer of fluid, so that the brain lies in a water bed, which protects it from concussion. The weight of the brain is about 49 ounces in the male and rather less in the female, this disparity being due to the weight of the average female being less than that of the average male. The relation of brain weight to body weight is in fish 1 to 5,000, birds 1 to 220, lower mammals 1 to 180, in apes 1 to 120, in man 1 to 50. The brain weight of distinguished men is on the whole higher than that of others, whilst that of Europeans is above that of savages; but there are many exceptions, quality being of more value than quantity. The brain of the lunatic can often not be distinguished from that of the normal man, nor can that of a criminal be recognised as such. Of the ultimate connection between brain and mind we are ignorant, but much knowledge has been gained during the last thirty years of the exact parts of the brain that are concerned in particular processes. Certain parts are now known to be concerned in the movement of the various parts of the body, and it is noteworthy that the right side of the body is controlled by the left side of the brain; other parts are concerned in vision, hearing and the other senses; it is thought, but it is not yet known for certain, that the frontal portion is concerned with mental processes alone. The bold claims of phrenology, which labels almost every spot in the skull with the name of a virtue or a vice, have no foundation in real science.

The diseases to which the brain is liable are numerous. Inflammation of its membranes is *meningitis.* This is commonly associated with *water on the brain,* because the brain is hollow and contains fluid, which normally is constantly overflowing through three minute pores into the space between the brain and its membranes, and when inflammation occurs the pores become blocked and fluid, which is being constantly formed within the brain, is locked up there. *Brain-fever* is a vague term in popular use to denote any condition accompanied by delirium, especially meningitis. Rupture of a blood-vessel within the brain causes *apoplexy;* clotting in a blood-vessel *cerebral thrombosis. Softening of the Brain* denotes the normal mental decay of advanced life, which may occur prematurely in certain cases. *Abscesses and tumours* also occur, in the treatment of which surgery has made great strides of late. [For *Concussion* refer to *Blows. Meningitis, Apoplexy, and Cerebral Thrombosis* are treated under their respective headings.]

BRANDY, Cognac and the best kinds are distilled from wine; the cheaper forms are prepared from malt. It contains 40 to 50 per cent. of alcohol and many ethers peculiar to itself. It is the best stimulant for medical purposes when a strong stimulant is required. When abused it is said to cause delirium tremens more often than any other form of alcohol.

BREAD consists of starch, gluten and salts chiefly. The finest flour consists of little more than starch, so that "seconds" flour is preferable for bread making. If more bran than that in seconds flour is used the bread is indigestible. In order that bread may readily be digested it must be thoroughly mixed with saliva. It is on this account that dough is made to rise in bread-making, either by the action of yeast or chemicals, or, as in "aerated bread," by pumping into the dough an aerated water. Bread made from such dough is porous and thus gives the saliva easy access to all its substance. Again, bread one day old is much more digestible than new bread, because being drier it soaks up more saliva, whilst toast or rusk is more digestible still, being still drier and also more brittle and therefore more easily masticated. French toast, on the other hand, made by soaking bread in melted

butter, is indigestible because the fat prevents the saliva reaching the bread. As bread depends on saliva very largely for digestion, a baby cannot digest it before six months after birth, as the saliva does not come till then. In diabetes bread is used, made from flour washed free of starch, which is known as gluten bread.

BREAST. Hard nodules in the breast in middle-aged women require immediate attention, as they may be cancer. [See *Child-birth.*]

BREAST-PANG. See *Angina Pectoris.*

BREATHING. See *Respiration.*

BREATH, OFFENSIVE, may be caused by an unhealthy state of the teeth, throat, or stomach, and in children may be due to a piece of slate pencil or other foreign body that has been passed into the nose and not removed. If the teeth, gums or throat be at fault, a mouth wash such as the following will be useful :—Tincture of myrrh twenty drops, glycerine of borax one drachm, and water to the ounce.

BRIGHT'S DISEASE, named after the physician who first described it, includes all forms of inflammation of the kidneys. The two chief forms are acute and chronic Bright's disease. The *acute* form is caused by chill or by certain poisons, e.g. alcohol or that of one of the fevers, especially scarlet fever. The *symptoms* are dropsy, scanty urine containing blood, vomiting and a rise of temperature. The *treatment* should be rest in bed and rest of the kidneys by throwing their work on to the skin and bowels, which when stimulated are capable of doing much normally performed by the kidneys. The patient should be clad in flannel and the bed be stripped of the sheets, blankets alone being used. The skin is made to act by copious draughts of water followed by hot packs daily (see *baths*), and the bowels are stimulated by the free use of Epsom salts. Poultices may also be applied to the loins. Gin is a popular remedy, which irritates the kidneys and does much harm. The diet should be milk and bread and butter. The *chronic* form may result from the acute form but more often appears without obvious cause in middle age. It is very common in the gouty and those whose habits lead to gout. The *symptoms* are often for years confined to the presence of albumin in the urine, which may be only detected when the sufferer tries to insure his life. In time, however, the general health suffers, the mental power is not so good, headaches, attacks of vomiting and slight puffiness of the eyelids supervene, the arteries become hard and brittle and apoplexy may result. The *treatment* is to regulate the daily habits so as to reduce the work the kidneys have to do as much as possible. This is done by taking meat only once daily, by abstaining from alcohol and by making the skin and the bowels act freely. A daily sweat should be obtained and a daily bath taken ; chill carefully avoided. Epsom salts and an occasional dose of calomel taken, flannel worn next the skin, and plenty of water drunk. The best climate is an equable one. No drugs will cure the damaged kidney.

BROKEN BONES. Simple fractures are those in which the skin is intact, compound fractures those in which the skin is broken as well as the bone, impacted fractures are those in which one fragment is embedded in the other. They heal by throwing out much temporary tissue, known as callus, to act as scaffolding to hold the two ends of the bone together. The less perfectly the affected limb is kept at rest the greater the callus formation. In setting a broken bone no attempt is made to fit the fragments into each other, as all the sharp ends are absorbed in the process of repair, but the bones must be brought as near together as possible and the joint both above and below prevented from moving by suitable splints. A great change has come in the treatment of fractures. Up till quite lately the most rigid prevention of movement was secured for many weeks, with the result that while the bone healed the muscles wasted and the joints became immovable. Now the limb as a whole is considered, massage and passive movement are begun early and splints soon discarded. The X rays and the free use of anæsthetics have done much for the treatment of fractures. An anæsthetic is not merely to relieve pain, it is to relax the muscles which are preventing the bones from being brought together. [Refer to *First Aid.*]

BROMIDE of potassium, sodium, or ammonia, is used in the treatment of epilepsy and insomnia. It should only be taken by medical orders.

BRONCHI are the two air tubes which put the windpipe into communication with the lungs. They are liable to inflammation, a condition termed bronchitis.

BRONCHITIS may be acute or chronic, and either an independent affection or due to some other disease, especially certain fevers. The disease consists of inflammation of the lining membrane of the bronchi, which are the tubes into which the windpipe opens. The *symptoms* of an acute attack are a feeling of rawness at the top of the chest, hoarseness, and cough which is at first dry and hacking, and later in the attack loose ; the expectoration is at first scanty, then more copious and more frothy, and later becomes yellow and again scanty ; the temperature is usually not much raised. The treatment should be confinement to bed, in a room the air of which is moistened by a steam kettle and kept at an even temperature, of 60° in winter and 65° in summer. Special care is required between two and four in the morning not to let the temperature of the room fall. The diet should be light and plenty of barley water and imperial drink allowed. Counter irritation over the upper end of the chest is at times useful, which is effected by the application of mustard leaves or of turpentine liniment. Medicine is required to make the skin act and to check the useless cough in the early stage, and the best for this purpose for an adult is probably ten grains of Dover's Powder at bed-time. When the cough loosens, medicine to aid expectoration is required, such as sal volatile half a drachm, spirits of chloroform ten drops and infusion of senega to the ounce ; to be taken every four hours. In severe attacks of bronchitis the inflammation may spread to the lung, or the strain of coughing may dilate the heart and cause increased shortness of breath and blueness of the face ; brandy and other heart stimulants will then be requisite. Except in very mild cases the treatment should be in medical hands from the outset. *Chronic bronchitis* is common in those of advanced years who have been much exposed to all weathers in their work. The treatment should be flannel garments next the skin, especial care being taken to keep the upper part of the chest covered, avoidance of inclemency of the weather, and of dusty or stuffy rooms and the use of certain medicines when the cough is tight to "cut the phlegm" ; for this purpose syrup of squills is recommended in half-teaspoonful doses in a small quantity of either water or linseed tea. The cough should not be suppressed by opium, especially at night, as this is dangerous, and a word of caution is necessary because many patent cough cures contain opium. Chronic bronchitis in youth should receive prompt attention, as it may be the onset of consumption.

BROW AGUE is a form of neuralgia. [See *Neuralgia.*]

BRUISE is of the same nature and requires the same treatment as a black eye. [See *Black Eye.*]

BUBO is inflammation of a lymphatic gland. The lymphatic glands strain the lymph passing through them, and if germs be present stop them. The germs then cause inflammation in the gland instead of reaching the blood and poisoning it. All the lymph from the hand and arm drains through the glands of the arm pit, hence a sore on the finger may cause a bubo in the arm pit ; again the lymph in the foot, leg, and thigh passes to the glands of the groin, and a bubo here is a common result of a sore heel, whilst a sore throat may cause a bubo at the angle of the jaw. The *treatment* should be rest and the local application of fomentations ; if an abscess forms this should be lanced. A light diet and a purge should also be taken.

BUNION is caused by the prolonged use of pointed toed boots. By such boots the big toe is thrust towards the centre line of the foot and the base of the toe exposed to pressure unduly. The frequent repetition of pressure always excites the growth of the part pressed on, hence the base of the big toe enlarges and the bursa or water

cushion between the bone and the skin also enlarges. The swelling thus caused is known as a bunion. It is very apt to become inflamed. The treatment should be preventive, but when the bunion is present further pressure should be avoided by special boots, and in severe cases a surgical operation may be resorted to.

BURNETT'S FLUID is a useful disinfectant for drains. The chief ingredient is chloride of zinc, and it is, therefore, poisonous. It is best used undiluted if a thorough disinfectant is required.

BURNS AND SCALDS are dangerous when severe. The depth to which a burn penetrates is of less importance than the area it involves; there is always hope of recovery if less than one-third of the whole skin is destroyed. The dangers of burns are at first shock to the nervous system; later blood poisoning, pneumonia, or exhaustion, and finally deformity may result from contraction of the scars. (1) Treatment when *severe*. Wrap the child in a blanket and put it to bed at once without removal of the burnt clothes. Apply hot bottles, wrapped in flannel, to the feet and place one on each side of the child. Give it brandy and hot water, the right dose of which is a teaspoonful of brandy if under two years of age and half a teaspoonful more for each year that the child is over two, until a dose of three teaspoonfuls has been reached. The brandy should be given in two tablespoonfuls of hot water. Any part of the burnt surface which is exposed to the air should be at once protected by clean rag or unstarched muslin, spread with vaseline or soaked in olive or carron oil, and failing this by flour shaken from a dredger. Nothing further should be attempted till the doctor comes. Plenty of hot water should be ready, as it may be decided to place the child in a hot bath, when the doctor arrives, in order to combat shock and soak off the burnt clothing. (2) Treatment when *slight*. While remedies are being prepared the burnt part should be plunged into cold water. Cotton wool and a bandage should be applied, or failing this a mixture of whitening and vinegar, or flour or oil on rag may be used. Next day boric or eucalyptus ointment spread on clean linen should be applied, and if the burnt surface is caked with flour, a bread poultice should be applied first, as this will leave the surface clean. Any blisters that form should be pricked. (3) Treatment of *scalds of mouth and throat*. This accident results from children drinking from the kettle. The doctor should be sent for and tracheotomy may become necessary owing to the subsequent swelling of the throat obstructing breathing. No attempt should be made to treat the burnt mouth before the doctor arrives, but the child should be wrapped in a shawl and nursed by the fire.

BURSA is a natural water cushion for relieving pressure. It forms in response to pressure, hence many are normally present at points where tendons pass over bones. The followers of many occupations present special bursæ formed as the result of their work; of these trades bursæ as they are called, the housemaid's knee is probably the best known. Bursæ are apt to become inflamed, a condition known as bursitis. The treatment then required is rest of the affected limb, and if an abscess forms free incision.

CACHET consists of two discs of wafer paper enclosing a drug between them. The cachet is swallowed whole, and the taste of the drug is thus avoided. Many nauseous drugs are administered by this means.

CACHEXIA, literally "bad condition," is a term used to denote the exhausted state produced by such a grave disease as cancer when it has existed for some time.

CÆCUM is a short piece of bowel, attached to the Vermiform Appendix at its lower end, opening into the large bowel at its upper end. [See *Appendicitis*.]

CÆSARIAN SECTION consists in opening the abdomen and the womb and then in removing the child with the after-birth. The operation is resorted to when other means of delivery are ineffectual. The name is due to the legend that Julius Cæsar was brought into the world in this way.

CAFFEIN is the alkaloid contained in tea and coffee. Caffein citrate is a white powder, devoid of smell, but possessing a slightly acid taste. A five grain dose may be taken to relieve a sick headache, and repeated twice, if desired, within the next four hours, but not more often. Phenacetin (dose: grains, five to ten) is usually more efficacious, but both may be often taken with advantage at the same time.

CAJUPUT OIL has a warm aromatic taste and a strong odour resembling camphor. One to three drops may be taken on sugar to relieve flatulence, or ten drops of spirits of cajuput may be taken in a tablespoonful of water.

CALCULUS is a stone formed within the body. It is met with most often in the biliary or the urinary passages. [Refer to *Bladder, Gall-stones*.]

CALOMEL, or subchloride of mercury, is an insoluble, tasteless powder. A dose of two grains taken at night acts on the bowels freely next morning. It is well to follow it by a Seidlitz powder before breakfast, otherwise it may act repeatedly throughout the following day. Calomel is too strong a purge to use frequently, and is best taken by medical advice only. It is not suited for administration to children.

CAMOMILE. See *Chamomile*.

CAMPHOR, when applied externally, produces redness of the skin, and acts as a mild counter-irritant. For this purpose camphorated oil or compound camphor liniment should be used. When taken internally, camphor relieves flatulence and acts as a heart stimulant. It should be taken in the form of spirits of camphor (dose, ten drops) in milk or on sugar, but not in water. In large doses camphor is poisonous. Though so often used in tooth powders, it probably does harm by making the enamel of the teeth crack.

CANCER is a malignant growth, having the property of giving rise to secondary growths exactly like itself in distant organs. The tumour grows faster than the new blood-vessels required to nourish it, with the result that in time the tumour mortifies, the skin over it breaks down, and a foul ulcerating wound is produced which gradually wears out the sufferer. The disease seems on the increase. The *cause* of cancer in spite of much research is not yet discovered. Certain facts are, however, known. Heredity plays some part, though the healthiest may be attacked; age also influences the liability to attack. One form of cancer, known as sarcoma, attacks specially the very young and the very old; whilst the other form of cancer, carcinoma, is rare before thirty and only common between forty and sixty. (Many of the higher animals are liable to the disease). The disease is most common in wooded districts and along the banks of rivers, like the Thames, which flow through a clay district and flood their banks often. Many examples are now on record of houses, in which one tenant after another has died of cancer, as though the houses were infected; and recently a group of cases, in which all alike had frequented the same bar of a village inn, has been reported. Again, a cancer, at times, gives rise to a second cancer in skin that rubs constantly against it, as in the case of a paralysed arm that lay on a cancer of the breast; so that there is evidence for the infectivity of cancer; and this suggests a parasite as the cause. This view is also supported by the fact that cancer is apt to develop at points that have long been exposed to injury, such as the friction of a broken tooth against the tongue or of the constant pressure of the shoemaker's last against his stomach. Many observers have found bodies that look like parasites in cancer, but no one has yet isolated the parasite and with it caused undoubted cancer in animals. If not due to a parasite, cancer may be due to tissue that has remained latent since birth, and which in response to injury or other cause, late in life takes on an abnormal activity of growth. The *symptoms* of cancer vary with the organ attacked. In women the breast and the womb and in men the tongue, lips, stomach and bowel are the chief organs attacked. The presence of any wart or of hard lumps under the skin or on the tongue, and any offensive or blood-stained discharge at any time of life, should receive prompt attention, because while probably examination will prove it due to nothing serious, yet it may be cancer, and delay prove fatal. If only cancer

be recognised sufficiently soon and the surgeon be sufficiently thorough, cancer may be and often is completely eradicated. The *treatment* of cancer by caustics, by radium and by various serums has so far failed, though in the closely allied rodent ulcer the X rays and the Finsen Light treatment have been of some service. [Refer to *Rodent Ulcer.*]

CANCRUM ORIS. See *Noma.*

CANTHARIDES is a drug derived from a beetle. Though occasionally given in medicine, it is mainly used externally to raise blisters, or to promote the growth of the hair. [See *Blister, Baldness.*]

CAPILLARY is a bloodvessel, microscopic in size, which connects an artery to a vein. A network of capillaries is present in all parts of the body except the hair, the nails, the surface of the skin, the gristle, and the transparent part of the eye-ball. Capillaries were first demonstrated by Malpighi in 1661. The name is derived from *capilla*, a hair, though capillaries are really of much smaller diameter.

CAPSICUM, when dried and powdered, is known as red pepper or cayenne. Three drops of tincture of capsicum in a tablespoonful of water may be taken to relieve flatulence.

CAPSULE is made of gelatine, and contains a dose of some drug, the taste of which it is desirable to avoid. Capsules are taken like pills.

CARBOLIC ACID. See *Disinfection, Toothache.*

CARBUNCLE is like a large boil, but is more deeply situated and it discharges through several openings in the skin instead of one. The commonest site is at the back of the neck. Carbuncles occur most often in men who are gouty, alcoholic or diabetic. The effect on the general health is always great and may be fatal. The treatment is to make two incisions freely into the carbuncle at right angles to each other and then to apply boric fomentations every three hours until the wound is clean and healthy; the general health requires ample support by stimulants and nourishing food; the bowels also should be attended to.

CARCINOMA. See *Cancer.*

CARIES. See *Teeth* and *Bone Disease.*

CARMINATIVES are remedies which relieve flatulence. Most of them owe their value to an essential oil; peppermint, ginger, cloves, cardamoms and cajuput are examples.

CAROTID is the main artery of the neck.

CARRON OIL is composed of lime water and linseed oil in equal parts. It is a useful application for burns.

CARTILAGE is the technical name for gristle, a tissue adapted to act as elastic padding. Hence we find a pad of cartilage between each of the vertebræ in the spine, and a lining of cartilage in the joints. In the knee joint there are, in addition, two semicircular pads of cartilage, one of which is apt to become displaced, an accident common on the football field. The majority of the bones exist first in the form of gristle, changing to bone gradually; in old age much of the cartilage becomes impregnated with chalky material, and thus loses its elasticity.

CASCARA is a drug of bitter taste and aperient action. Tablets containing two grains of the dry extract of cascara form a safe and useful laxative in cases of chronic constipation. They should be taken at night. The dose is from two to eight grains, but two grains usually are sufficient; if not, it may be followed by a dose of salts before breakfast. The liquid extract (dose, a half to one teaspoonful) is a rather more active aperient, but has a nauseous taste that can be only partially disguised by the addition of liquorice or sal volatile.

CASEIN is the nitrogenous part of the curd of milk. It is now prepared on the large scale, and used to increase the nutritive value of other foods, e.g., soups, chocolate, etc. [Refer to *Food.*]

CASTOR OIL is one of the safest aperients, but it requires disguising not to be nauseous. Many ways have been recommended; of these giving castor oil in tea, coffee, soup and yolk of egg we do not advise; as subsequent distaste for these articles may result. We recommend that the oil, the medicine glass and the milk used to dilute the oil be all well warmed, and the glass then wetted round the margin, some warm milk placed in the glass, then the oil and then some more milk; the dose should then be administered without shaking the glass. The sense of taste may be blunted beforehand by a pinch of salt on the tongue; after the dose, eating a raisin cleans the mouth very well. Instead of giving the oil in milk it may be given to adults in hot brandy and water.

CATALEPSY is a disease of the nervous system in which consciousness is modified or absent, power of motion and sensation lost, and the limbs remain in whatever position they are placed. The daily press is always referring to some one or other alleged to have been buried alive while in a cataleptic state, but in reality catalepsy is infinitely rare.

CATARACT is an opacity in the lens of the eye. The public think it is on the surface of the eye, whereas it is really deeply placed. Certain kinds of cataract occur in childhood, but the most common form is a disease of advanced life. The symptoms are gradual failing of vision, not at first so marked in a dim light. The treatment is to wear dark glasses if these are found of service, and to wait until the cataract is ripe and then have it removed, afterwards the place of the lens in vision will be taken by a suitable spectacle glass.

CATARRH, literally "flowing down," indicates an inflammation of a mucous membrane, accompanied by an increased discharge of mucus. A cold in the head is the most familiar example of a catarrh.

CATHETER is an instrument for drawing off water from the bladder. The material of which they are made is either metal, gum elastic, or rubber. Catheters for the female are also made of glass, but these are not recommended. In certain cases the frequent passage of a catheter may be necessary for years, and the sufferer may have to do this himself. Let him bear in mind the following points:—only soft catheters are safe in his hands; the catheter used must present no flaws or rough surfaces, and it must be sterilised before and after use. The gum elastic kind are best sterilised by keeping them in glycerine which contains perchloride of mercury of a strength of one in two thousand; the rubber catheter should be boiled before and after use.

CAUSTICS are substances which destroy the tissues by their chemical action. They are used to remove warts, to touch dog-bites and to stimulate ulcers, which heal slowly. Caustics have done much harm in cancer by partially destroying it and stimulating it to renewed activity, but in the form of secret remedies for cancer they are still in use. The chief caustics in use are fuming nitric acid, glacial acetic acid, silver nitrate or lunar caustic, caustic potash, pure carbolic acid, and arsenic.

CAUTERY is a means of destroying tissue by heat. It may take the form of a white hot iron heated in the fire or more often at the present day of an electric-cautery in which the heat is produced by the electric current. The electric cautery is of especial value in operations in the nose, as it can be passed cold and only made white hot by turning on the current when the exact spot to be burnt is in contact with it. Another form of cautery in wide use is the Paquelin's benzoline cautery, in which the cautery is kept hot by a jet of benzoline vapour.

CAYENNE. See *Capsicum.*

CELL is the term used to denote the elements of which the body is built. All living matter is composed of cells; in the lowest forms of plant and animal life, the organism consists of one cell only, in the higher forms of more than one cell, except at the beginning of life. The beginning of each individual is an ovum or egg, which is a single cell; but directly the egg begins to develop, it divides so that the one cell becomes two, and the two four, and so on, until a mass of cells results which differentiate into the various organs of the future animal. In certain cases the cells secrete material in which they lie imbedded; for instance in bone, which consists of few cells and much intercellular chalky material. In other cases the cells remain in contact with one another with a minimum of intercellular material; in fact, only just enough to cement the cells firmly together, skin is an example of this form. In yet a third variety of

tissue, the cells secrete fluid and produce a tissue composed of fluid with cells floating in it; for example, blood. The cells, together with the intercellular material they produce, form a "tissue." Cells always arise by the division into two of a pre-existing cell, and hence tumours always arise by the abnormal activity of the cells at the site of the future tumour, a fact of great import only realised comparatively recently and first expressed by Virchow in the classic phrase, "Omnis cellula e cellula."

CELLULAR TISSUE is a term used to denote the loose connective tissue the meshes of which form spaces that contain lymph.

CELLULITIS is inflammation of the cellular tissue, and most often occurs in the cellular tissue beneath the skin. The symptoms are high fever and great swelling, heat, pain and redness of the skin of the affected part with a marked tendency to spread up the limb. The tension caused often leads, if unrelieved, to the death of much tissue and subsequent abscess formation; general blood-poisoning is to be feared. The *treatment* is to make free incisions into the inflamed area and then to apply boracic fomentations and to place the limb in a boracic bath for an hour or two a day; the general condition requires free stimulation and nourishing diet. A doctor is of course essential.

CEREBRAL THROMBOSIS is a clotting of a blood-vessel in the brain. By this accident the part of the brain supplied by the blood-vessel is cut off from the circulation and its functions abolished. The causes are a sluggish circulation combined with arteries that are roughened in their interior. Such a condition most often occurs in old people with Bright's disease or gout, and as the circulation is feeblest during sleep, cerebral thrombosis most often occurs at night. When the patient wakes he finds himself unable to get out of bed because he has had a stroke down one side, and if this be on the right side, the speech is often affected also. As a rule some recovery takes place, but often a second stroke occurs due to the clot spreading or forming on the other side of the brain. The leg recovers before the arm and the arm before the hand; in two months, if any recovery is to be expected, signs of improvement should be present. The *treatment* should be such as to stimulate the circulation and thus hinder further clotting. The paralysed limbs should be gently massaged and the joints moved twice daily to prevent contracture developing. [Compare with *Apoplexy.*]

CHAFING is best avoided by keeping the parts dry and clean. Oatmeal water should be used for washing the affected part, and after drying by dabbing with a soft towel, a dusting powder of zinc oxide and starch in equal parts should be applied.

CHALK, in the form of prepared or precipitated chalk, may be used to check mild diarrhœa. The dose is ten to sixty grains every two hours till the diarrhœa is controlled. A more convenient form of this drug is chalk mixture (dose, one to two tablespoonfuls). It may be given to children. Precipitated chalk may be used as a dusting powder for moist eczema or as a tooth powder.

CHALK STONE is a deposit of urate of soda, which occurs in the ears or fingers of the subjects of gout. [Refer to *Gout.*]

CHALYBEATE. Though chalybeate waters contain much iron in solution, they are seldom the best means of administering iron.

CHAMOMILE. An infusion of tea prepared from the flower heads of this plant is an old-fashioned remedy for flatulence (dose, two to six tablespoonfuls). In larger doses it often causes vomiting. Poultices prepared from chamomile have no special advantage over an ordinary linseed poultice. To make chamomile tea, pour a pint of boiling water on an ounce of the dried flower heads, and after allowing to stand for a quarter of an hour, strain through muslin.

CHAMPAGNE contains only twelve per cent. of alcohol, but when effervescing is very stimulating. It is much used in medicine in cases of obstinate vomiting and in pneumonia.

CHANGE OF LIFE, or the climacteric or menopause, is the name of the time of life at which menstruation normally ceases. The symptoms most often met with at the climacteric are at the outset irregularities in menstruation, a change of weight, which is generally a gain but may be a marked loss; troublesome flushings often followed by sweating; emotional disturbance passing into insanity in certain cases. The age is usually forty-five to fifty, and the duration of the change of life often extends to two years. The only treatment required is to avoid worry as much as possible and to live a quiet, healthy life. The symptoms described, having not been experienced before, often give rise to the belief that they indicate cancer or some other grave disease, which is best combated by impressing on the mind that these symptoms are normal and will pass away in time.

CHAPS on the hands are best avoided by washing in cold water and by the use of equal parts of glycerine and lotio rubra just before the hands are dried. When present chaps are best treated by rubbing in glycerine and wearing clean cotton gloves all night. Deep cracks may be stimulated to heal by touching with lunar caustic. *Cracked lips* are best treated with cold cream. [For *Chapped nipple* see *Child Birth.*]

CHARCOAL has little or no action, and is not recommended either as a poultice or for internal use. It may be used as a tooth powder, but there are many powders which are better.

CHEESE. See *Food.*

CHEST is bounded above by the root of the neck, below by the diaphragm, in front by the sternum or breast bone, behind by the backbone, and on each side by the ribs. The chest contains the heart with its great vessels enclosed in a bag—the pericardium—which is attached below to the diaphragm: the lower end of the wind-pipe dividing into the two bronchi, to each of which a lung is attached. Each lung is covered by a membrane—the pleura—which passes from the root of the lung over the pericardium to the breast bone, and thence over the inner surface of the chest wall to the backbone, and from there back to the root of the lung. The space between the lung and the chest wall is thus lined with pleura, and is known as the pleural cavity, which is normally very small, because the lung remains in contact with the chest wall. The pleural cavity contains a little fluid, and when the pleura is inflamed this fluid is often much increased, the lung is compressed, and the pleural cavity enlarged. Lastly, passing down in front of the backbone behind the heart are the gullet, the descending aorta, the two sympathetic and vagus nerves and the thoracic duct.

CHICKEN POX is a highly infectious disease due to a germ, which is not yet discovered. Usually there is only a slight feeling of illness and little or no fever. The rash is often the first symptom, and this appears as red spots, which rapidly change to blisters, and some of these to mattery heads. The spots usually dry to scabs, which separate in a few days, leaving at times deep scars. Infectiousness is at an end when all the scabs have fallen off. The *treatment* should be strict isolation till all the scabs are off; confinement to bed will only be necessary for a day or two while the child is feverish; scratching should be discouraged and if necessary prevented by cutting the nails short and placing the hands in gloves without fingers. Warm baths are recommended as aids to the separation of the scabs. No medicine is required and no complications need be dreaded, but the toys and clothing used by the invalid should be disinfected. [Refer to *Fevers; Sick Room; Small Pox.*]

CHILBLAIN is due to the paralysis, by cold, of the blood-vessels in the affected part. The fingers, toes, ears and more rarely the tip of the nose are most often attacked, and certain people with a sluggish circulation are more prone to chilblains than others; many children grow out of them. In the first stage of a chilblain the part is white and cold; in the second stage congested, hot, red and itching. The treatment should be preventive; in cold weather loose woollen gloves should be worn and tight boots avoided, exercise encouraged, and the skin kept clean and dry. When a chilblain has formed it should be painted with collodion or dusted with starch and wrapped

in cotton wool. Care should be taken that the skin does not break; but if this happens the sore should be treated with boracic ointment.

CHILD-BIRTH. About a fortnight before delivery more ease in breathing, combined with greater difficulty with the bowels, occurs. This symptom is a sign of approaching labour, but the actual onset of labour is indicated by recurrent abdominal pains. It is the occurrence of pains regularly every quarter of an hour which indicates the time to send for the doctor. The preparations necessary for labour comprise the preparation both of the labour room and of the patient. The room should be clean; the bed narrow with a hair mattress, which should be covered by a mackintosh, a blanket, a sheet, and by a second mackintosh and sheet, so that after the labour the top sheet and mackintosh can be removed and the bed left ready without further manipulation. As the life of the patient depends chiefly on the hands of the attendants being clean, a nail brush, soap and water must be provided and a bowl of strong Condy's fluid. The hands having been washed thoroughly are soaked in the Condy's fluid, whilst one hundred is counted, and are then dried on clean towels; furniture, fireirons, etc., should be held also in a clean towel and not by the naked hand. The following articles are requisite:—night table, bed pan, douche can, enema syringe, female catheter, medicine glass, sal volatile, glycerine, carbolised vaseline, smelling salts, a fan, plenty of clean towels and diapers, the binder and safety pins, needle and cotton, the materials for washing and clothing the child and treating the cord; and a good fire with a large kettle of hot water. The patient should be prepared by being suitably clothed and by the administration of an aperient. A dressing-gown, night dress, flannel petticoat, stockings and slippers are recommended as the most suitable clothing. In the management of labour, the golden rules are to be patient, clean, and prompt in detecting anything abnormal. Only one attendant should be present in the room whilst another should be within call.

The mother should remain in bed ten days and only get up on a sofa for the next four or five days. The temperature should be taken night and morning, and whenever above 100° F. the doctor at once informed. The diet should be a spoon one until the bowels act; the latter require to be moved by an aperient as a rule, given on the second night. The milk does not come freely till the third day, when the breasts become full and tender and the temperature often reaches 100° F. If the baby fails to relieve this fulness, the milk should be drawn off by a breast pump, otherwise an abscess may form. The nipples must be carefully dried every time they have been used, or they will crack. Such cracks may cause an abscess of the breast and are best treated by touching them with lunar caustic. Flat or badly formed nipples may require the use of a nipple shield to enable the baby to suck. Should the baby be stillborn, the milk may be dried up by applying belladonna plasters to each breast, a central hole allowing the nipple to protrude, the diet taken should at the same time be dry and rather scanty and a dose of Epsom salts be taken. The chief dangers are puerperal fever, which most often sets in with a rigor on the third or the tenth day; and rarely an acute form of insanity occurs.

CHILDHOOD. Infancy, or the first two years of life, is dealt with under that heading. After this age the diet should be varied, and much the same as that of the parents. Milk should be used freely, plenty of water allowed, tea and coffee used moderately and no food or sweets between meals permitted; highly spiced and all smoked foods except bacon are unsuitable; fat is best given in the form of good butter and of milk, sugar in puddings, etc., is good food; buns, new bread, pastry and cheese are unsuitable; the last meal should be light. The clothing should be flannel next the skin unless the skin is irritable, when silk or fine calico has to be used and flannel worn over this; the top of the chest and the legs, the feet and the hands are the parts that require keeping warm; all tight belts, hats and garters are harmful. Neither coddling nor hardening methods are recommended, but the same common sense should be used in the daily habits of the child as the parents employ for themselves. Sleep should be ample and regular, the bedtime should be early, the bed should have a hair mattress, the covering should be light and on no account should the child be allowed to sleep with the head under the clothes; the bedroom window should be open at the top; the best night-dress is flannel combinations, as most children kick off the bed-clothes during sleep; a fire in the bedroom is not recommended. Restless sleep is probably due to indigestion. Mouth breathing and snoring during sleep may be due to adenoids, and should be reported to the family doctor. In the day time the minimum of restraint is the object to be aimed at. To laugh, romp, make weird noises and to get spotted with dirt are essential to health and to normal growth both of body and mind. A child should be taken for a run in the country just as a dog is taken—not on the chain—he should be kept in sight and encouraged to poke about and find for himself objects of amusement; the ball should be used early, as the best introduction to sports, the skipping rope is also valuable; all toys will be introduced into the mouth, and on this account must not be coloured with poisonous paints.

A child should be taught self-control from an early age. Implicit obedience should be insisted on, so that this becomes habitual before the child is three. It should be clean in its habits by the time it is two, and if not so by this age either the parents are to blame or the child is weak-minded. Book-learning should not be pressed till the child is seven or eight, but much mental training can be acquired before this age from the surroundings in the home, the street and the country, and the natural inquisitiveness of the child's mind should be encouraged. This is best done not by telling the child not to ask foolish questions but when necessary by the frank statement that the question cannot be answered. To deceive a child is to lose his confidence and to teach him to be untruthful. [Refer to *Growth.*]

CHLORODYNE. See *Opium.*

CHLOROFORM. See *Anæsthetics.* **CHLOROSIS.** See *Anæmia.*

CHOCOLATE. See *Cocoa.*

CHOKING is best treated, if any treatment be required, by a smart slap between the shoulders. Fish bones sometimes become fixed in the throat. They are best dislodged by copious draughts of water or by eating some bread and butter. Rarely a doctor may be required.

CHOLERA is an infectious disease caused by a germ, that is spread in water, and characterised by profuse diarrhœa, rapid loss of strength and by a fatal ending in most of the cases. Cholera nostras or British cholera is the name of the epidemic diarrhœa that breaks out often in the summer months. The symptoms are similar but less severe.

CIDER made from apples, as well as perry from pears, contains over 5 per cent. of alcohol, and both are therefore stronger than small beer. They are slightly aperient.

CIGARETTE. See *Smoking.*

CIRCULATION is the passage of the blood from the heart to all parts of the body and back to the heart. The blood is now known to pass from the left side of the heart to all parts of the body except the lungs, and thence to the right side of the heart, which sends it back to the left side of the heart by passing it through the lungs, where it is purified. The passage of the blood from right heart to left heart through the lungs was discovered by Servetus in 1553, but the completion of the circuit was only demonstrated as recently as 1628 by Harvey. The result of this discovery was to prevent any patient consulting Harvey for ten years, so absurd were his views considered. The actual passage of the blood through the capillaries was first seen by Malpighi in 1661 with the aid of a lens. Up till Harvey's time the chief arteries were thought to carry air and not blood. [See *Blood-vessels; Heart.*]

CITRIC ACID is a colourless powder of acid taste, readily soluble in water. Two ounces to the pint of water make a solution rather stronger than lemon juice. The dose of citric acid is five to twenty grains. It is often used to produce an effervescing draught; a saltspoonful

of citric acid dissolved in a tablespoonful of cold water may be mixed with a similar solution of bicarbonate of soda, or potash, and the draught taken whilst it is effervescing. Such a draught forms a refreshing summer drink, and has a slightly diuretic action. Although not so effective as lemon juice, citric acid helps to ward off scurvy when fresh food cannot be obtained.

CITRINE OINTMENT contains nitrate of mercury. It is used to destroy the various animal and vegetable parasites which infest the skin, and to relieve itching. It should at first be applied to only a small part of the skin as it may prove too strong for some people.

CLARET contains 15 per cent. of alcohol. Its slightly acid quality makes it very acceptable when the mouth is parched, but like all red wines it is more astringent than white wines like Hock.

CLEFT PALATE is due to an imperfect development of the palate. The defect can be remedied by the surgeon most easily whilst the patient is still an infant.

CLERGYMAN'S SORE THROAT is a chronic inflammation of the throat due to over-use of the voice. An astringent gargle, such as alum, five drachms to the pint, should be used, the voice rested, and the general health toned up.

CLIMACTERIC is the change of life. [See this heading.]

CLIMATE. Various races of man live in widely different climates and maintain their health, nevertheless climate has a bearing on the prevalence of certain diseases. In Great Britain those river valleys which run south-west and north-east are ventilated freely by the prevailing winds, and are comparatively free from rheumatic fever and heart disease. Cancer is most prevalent along those rivers which frequently flood their banks, whilst consumption is least prevalent in these valleys and most prevalent in dry and exposed districts where cancer is not common. During convalescence certain health resorts are much more suitable than others. [See *Health Resorts.*]

CLINICAL MEDICINE is the study of medicine at the bedside, by the examination and observation of individual cases.

CLOTHING. See *Childhood; Infancy.*

CLOVES. One to three drops of oil of cloves may be taken on sugar to relieve flatulence. Cotton wool soaked in the oil may be placed in the cavity of a decayed tooth to relieve toothache.

CLUB-FOOT is a mal-position of the foot either dating from birth or from some form of paralysis, especially infantile paralysis. The deformity is caused by the paralysis of certain muscles and the over-action of others, which normally antagonise the action of those that are paralysed. In club-foot dating from birth it is probable that abnormal position of the child in the womb is the cause. Much can be done by splints, and if necessary by operation to remedy the condition, more especially if treatment be begun as soon after birth as possible. It is a great mistake to go direct to an instrument maker, as a surgeon generally uses much simpler and cheaper appliances.

CLYSTER. See *Enema.*

COCAINE is an alkaloid much used in surgery to numb the part on which the operation is to be performed. Coca leaves are chewed by the natives of Peru in order to deaden the pangs of hunger during long journeys without food. In this country there are, unfortunately, many slaves to the baneful habit of taking cocaine, a habit often combined with alcoholism. For this reason cocaine should never be used except in obedience to medical orders.

COCOA is more nutritious than tea or coffee and is like them a stimulant. The stimulating properties are due to theobromine, whilst that of tea and coffee are due to caffeine. Plasmon-cocoa is cocoa to which more nitrogenous food, viz. the casein of milk, has been added, and is still more nourishing though not so palatable to some people. Chocolate is cocoa and sugar worked up together, and is a most nourishing food suitable for a walking tour and for children. Milk-chocolate is prepared with milk, and is both nourishing and digestible.

COD-LIVER OIL is one of the most digestible forms of fat. Its taste may be covered by giving it as cod-liver oil and extract of malt mixture. A treacle-like mixture is thus formed which children take readily. Cod-liver oil is also advantageously given as an emulsion. Another way of giving cod-liver oil is by pouring away the oil from a tin of sardines and substituting cod-liver oil. After a few days the sardines will have soaked up the oil and be ready for use. The dose is from one to four teaspoonfuls twice daily after food.

COFFEE is a wholesome stimulant, which the stomach tolerates better than tea. The active ingredient is caffeine. Adulteration with chicory is widely practised, which is not deleterious though often fraudulent.

COLD IN THE HEAD is usually a disease in itself, but may be the onset of measles or influenza. The symptoms are too familiar to need description. The old saying, "three days coming, three at its height, and three going" is an accurate description, and should it last much longer medical advice should be sought, as neglected colds may be the onset of consumption. The prevention of colds may be effected with some success by an open-air life, cold baths in the mornings, plain diet, and by suitable clothing and sound boots; the stuffy room is the place in which the cold is caught. An attack should be treated by inhaling menthol or eucalyptus, or steam, by an aperient and by the use of cold cream locally.

COLD ON THE CHEST. See *Bronchitis.*

COLIC is a severe abdominal pain due to the irregular muscular contraction of some abdominal organ. There are three chief forms (1) intestinal, (2) renal and (3) biliary colic. The first form results from irritation of an obstruction within the bowel; the second is caused by the passage of a stone from the kidney to the bladder; the third is caused by the passage of a gall stone from the gall bladder to the intestine. The *Symptoms* are similar in all three forms. Intense abdominal pain of sudden outset is combined with sweating, coldness of the extremities and vomiting. The pain may double the sufferer up or he may roll on the floor in agony and unlike the pain of peritonitis it is relieved by pressure. The treatment should always be in medical hands, more especially as a small rupture may have become nipped by the abdominal wall through which it passes and be the real cause of the colic, for in such a case every hour of delay diminishes the chance of recovery. Before the doctor's arrival an olive oil enema at a temperature of 102° F. and about a pint in quantity may be injected and linseed poultices applied to the abdomen. A special form of intestinal colic occurs in painters and other lead workers due to the irritation of a daily dose of lead over long periods. The malady can be largely prevented by carefully cleansing the hands before meals and by avoiding the production of an atmosphere laden in dried paint. [See *Lead Poisoning.*] The *treatment* of an attack is a good dose of castor oil containing ten drops of laudanum, an olive oil enema and poultices to the abdomen.

COLLODION is made by dissolving gun cotton in ether and alcohol. Though not explosive, it is inflammable, and should be kept in glass bottles with good glass stoppers. Collodion is useful for clean cuts, chilblains, and corns. [See *Separate Heads.*]

COLON is the large intestine, from its origin at the ileo-cæcal valve to the sigmoid flexure, which is situated near the termination of the intestine. Inflammation of the Colon is *Colitis*, one form of which is dysentery.

COMA is a state of unconsciousness, so deep that the patient cannot be roused. The breathing is usually slow and the pulse also slow and easily felt, thus differing from the pulse of a fainting fit, in which the pulse is weak and difficult to feel. The causes fall under two groups, (1) injury to and (2) poisoning of the brain. Injury may be due to fracture of the skull or to rupture of a blood-vessel within the brain (that is apoplexy); poison may have been swallowed or injected under the skin, e.g., opium or carbolic acid or great excess of alcohol, or it may be produced within the body by constitutional disorders, e.g., Bright's disease and diabetes. Medical aid should be obtained, the head and shoulders meanwhile kept raised, no stimulants given and if necessary artificial respiration performed. Any

suspicious looking drinking vessel or powder that may suggest poison should be carefully preserved.

COMMINUTED FRACTURE denotes a bone splintered into fragments. Many people wrongly call such an accident simply a fracture, using the term broken bone to denote a bone broken in two cleanly. Properly speaking, however, any form of broken bone is a fracture. [Refer to *First Aid.*].

COMPLEXION varies with different races and in different phases of health. A good complexion is best obtained by living a healthy life. A yellow skin with marked whiteness of the eyes is due to a form of anæmia, but a yellow skin with yellow eyes is due to jaundice; a muddy complexion is common with indigestion, worry and overwork; a pasty complexion results from an excess of starchy foods with a deficiency of open air exercise; a bright flush on the cheeks with prominent veins on the temples and a thin wasted form is common in consumption; dilated veins over the cheek bones with a sallow complexion and slightly jaundiced eye are common in sufferers from disease of the liver due to chronic alcoholism; an engorgement of all the vessels of the face, nose and eye with bluish ears is seen in those liable to apoplexy; blueness of the lips and at times of the face also occurs in defective circulation due to heart disease or other cause; pimples most often indicate constipation; freckles occur in the thin skinned. The face may be protected from sunburn by a blue-green veil, and in the Himalayas the natives apply a protective powder with good results; probably calamine lotion would answer the purpose. Freckles are best not treated. Bathing the skin in lemon juice has been widely recommended and probably does no harm, though only curing by giving the freckle time to fade. More active measures are not advised, as the freckle is deep in the skin. Freckles may be prevented in the same way as sunburn. [Refer to *Acne* and *Acne Rosacea.*]

CONCUSSION. See *Blows.*

CONDY'S FLUID is a safe and useful antiseptic for domestic use. Sufficient should be added to water to make the mixture a bright pink.

CONFECTION is a powdered drug made into a paste with syrup; e.g. confection of senna (dose, half a teaspoonful), which forms a useful aperient that should be taken at bedtime.

CONFECTIONERY may be wholesome if properly made. Pastry made with good butter often agrees, when if the butter be replaced by fat or bad butter it disagrees. Sweets should only be allowed at meals, and they should be coloured with harmless material. The danger from poisonous colouring matter is far less than formerly, owing to the increased uses of the aniline dyes; carmine, cochineal and the juice of various fruits, e.g., cherry, currant, etc., are harmless; so also are indigo, saffron, spinach juice and Chinese ink. The dangerous colouring matters include lead chromate, Prussian blue, Scheele's green, vermilion made of oxide of mercury and white lead. The flavour of oil of bitter almonds used in almond paste, etc., is poisonous, and except in small quantities food flavoured with it is not wholesome.

CONGESTION denotes an excess of blood in any given area. The condition may be due to some obstruction to the circulation in the large veins that carry off the blood from the part. This variety of congestion is *passive* congestion. It occurs from heart disease, varicose veins, etc. On the other hand the congestion may be due to an increased supply of blood to the part. This variety is *active* congestion. It occurs usually as the first stage of inflammation, and is due to the presence of some irritant, e.g., a chemical, like turpentine, or a germ. [Refer to *Inflammation.*]

CONJUNCTIVA is the membrane which connects the eye to the eye-lids. Inflammation of the membrane is known as conjunctivitis. [Refer to *Eye.*]

CONSTIPATION, or Costiveness, is present when the bowels are not relieved thoroughly once a day.

The symptoms this causes vary. In certain cases, especially in women, no bad effects appear to result; in the majority, however, very definite symptoms result, such as bad taste in the mouth, coated tongue, headache, pimples on the face. Worse than these symptoms are the mental effects; good temper, a happy disposition, or a keen intellect are rarely possessed by those who are constipated. The peevish child, the nagging woman, the irritable man, the morbidly religious and the would-be suicide have this one fact in common, they are all constipated. A dose of castor oil is, in fact, very often the wisest form of corporal punishment for a child.

The treatment of constipation may be summed up in one word—prevention. Whereas the popular method is to allow violent purging to alternate with several days of constipation, or to produce chronic dilatation of the large bowel by frequent copious enemata.

To have to resort to a pill is in itself a confession of failure. First then acquire a regular habit of obtaining relief for the bowels at the same time each day. This should always be after a meal, because the taking of a meal is a natural stimulus. This stimulus may be increased by the use of tobacco after the meal in the majority of men. The best time is after breakfast, but for the city man who must catch his train, it is often wise to substitute for this the time after his evening meal. Otherwise he is tempted to omit obtaining relief whenever a little late; it is thus that much trouble begins. Regular exercise must be taken without profuse sweating; of the suitable forms, horse exercise is far the best, but cycling and walking are also good. Fresh air must be obtained as much as possible to improve the general muscular tone. It will be found, however, that the sudden change from a stuffy dwelling to the cliffs of the sea shore will cause constipation at first. This is only temporary, and demands a mild aperient. It is not true that the air is too strong, as is commonly said. A cold bath in the morning and massage of the abdomen are often useful. The diet should contain sufficient laxative materials, such as honey, prunes, wholemeal bread and fruits that contain seeds. In obstinate constipation, however, to continue the use of much fruit rich in seeds is a mistake, as it aggravates the condition. It is when the use of these avoids the necessity for medicine that they do good. When the above methods fail, medicine will be required. This medicine must be as little irritating as possible; castor oil, Epsom salts and senna are safe but nasty. Cascara in tabloid form is a little more irritating but is good and widely used. Three to six grains of extract of cascara at night, followed by two ounces of white mixture in the morning, is good. [White mixture is made by adding sixty grains of Epsom salts to one quarter this amount of carbonate of magnesia and shaking up in an ounce of peppermint water.]

This treatment should not be applied once only except in the case of very occasional constipation. If there is a marked tendency to constipation, it should be applied every day until a regular habit has been formed. As soon as the bowels are regular on this treatment the cascara is omitted and the white mixture alone used. After another week this can generally be omitted also, provided that it is resumed if the bowels do not act regularly without it. A pleasant substitute for white mixture is Hunyadi Janos. In the event of cascara and white mixture being ineffectual, the addition of nux vomica, belladonna or aloes to the cascara may be necessary. Of these aloes is to be avoided if possible, especially if piles are present. The majority of the patent pills contain aloes. All strong aperients must be avoided as much as possible and left off as soon as possible. For convenience of reference the following list may be of service:

Laratives; syrup of figs, syrup of senna, sulphur, fluid magnesia, castor oil in small doses, honey, treacle, and raisins or prunes. *Aperients;* liquorice powder, Epsom salts, cascara, senna or castor oil in larger doses, belladonna, hyoscyamus, nux vomica, aloes, rhubarb, blue pill, grey powder, calomel, and seidlitz powders. *Drastic Purgatives;* colocynth, jalap, scammony, asafœtida, gamboge, and croton oil. These drugs are not to be given without medical orders.

For the approximate composition of the chief patent pills see the "Lancet" for Nov. 28, 1903, Analysis by Dr. R. Hutchison. In this connection we may remember to

advantage the epitaph quoted by Dr. W. B. Cheadle, namely:

"If I had stuck to Epsom Salts
I shouldn't be lying in these here vaults."

"The best tonic is three drachms of Epsom Salts," wrote Dr. Hare in "Good Remedies out of Fashion."

Enemata are injections into the lower bowel. These should not be used without medical advice. In the same way the introduction of the tallow candle or the conical piece of soap so commonly practised by nursemaids on the infants under their charge is not recommended, whilst the introduction of paper is to be strongly condemned. The treatment of constipation in childhood consists in establishing regular habits, aided by massage, bathing, exercise and a mixed diet. If a drug is required, select one from the heading "laxatives" in the above list. Great pains must be taken to establish regular habits as early in life as possible, and to avoid the necessity for a resort to drugs.

CONSUMPTION, phthisis or pulmonary tuberculosis, is a disease of the lungs due to the attack of the tubercle bacillus discovered by Koch in 1882. The *causes* which enable the germ to successfully invade the body are various; an inherited tendency, dusty trades, indoor work, overcrowded dwellings, alcoholic excess, insufficient food, rapid child-bearing and prolonged suckling are the chief causes, and generally two or more of these are at work; thus a dusty trade is generally combined with alcoholism and insufficient food with an over-crowded dwelling. The tendency to consumption is not inherited by all the members of a family necessarily; for instance there was a nurse at the Brompton Hospital for nearly thirty years, who retired quite well and who had lost all the other members of her family from consumption, though none of them had been exposed to infection as much as herself. The age most liable is youth, but all ages are susceptible, indeed many of our aged paupers with chronic coughs have consumption of a slowly progressive kind. The *mode of infection* is nearly always by means of infected air or food; it is very rarely by direct transmission of the germ from mother to child during pregnancy. Consumptives infect the air around them only slightly by talking and coughing, but they infect it seriously if the expectoration is allowed to dry and float in the air as dust, hence spitting in train or tram cars is a public danger. The other chief source of infection is infected milk; cows suffer from tuberculosis of the udder, and their milk then contains the germ; such milk is unfit for human food unless thoroughly boiled. Koch has denied that infection can occur in this way, but the work of subsequent observers both in his own country and in ours points to his being wrong. The *mode of onset* varies, the chief forms are:—(1) a cold on the chest which does not get well, (2) a gradual loss of energy with indigestion, anæmia and some loss of weight, (3) the sudden expectoration of blood may be the first symptom, and (4) it may follow influenza or pleurisy, measles or whooping-cough. The *symptoms* are cough, wasting, night sweats, and a nocturnal rise of temperature. The illness may last months or many years, and it may end in recovery if taken in time, but more often temporary improvement alternates with relapses over a series of years; the mode of death is usually from exhaustion, or is sudden owing to a fatal hæmorrhage from the lungs. The prospect of recovery depends mainly on early treatment and on the determination of the patient. To eat the food necessary day after day requires more force of character than many patients possess. The *treatment* should be preventive, and as one-tenth of the total death rate is due to phthisis, public money will be well spent on prevention [See *Fevers*]. Those with a consumptive family history should feed well, take little alcohol, if any, and live much in the open air as well as sleep in well ventilated bedrooms; their place of residence should be such as to give the maximum of out-of-door life and their occupation also selected from the same point of view; it is noteworthy that sailors are prone to phthisis, so that the sea is not recommended as a calling. The treatment of consumption has made a great advance by the introduction of the open-air method combined with rest, abundant fatty food, no alcohol and no drugs. The fat, in England, is generally given as milk and butter, four pints of the former and a quarter of a pound of the latter being given daily in addition to a full meat diet. The treatment should be begun at one of the Sanatoria, but when the right habits have been formed there the treatment can be easily carried out at home, even though this be in a large town; the use of a night cap in sleeping out is warmly recommended, as it both keeps the ears warm and shuts out the noise of the early morning street traffic. The material coughed up should never be swallowed, and it should be received into rag, instead of handkerchiefs, and at once burnt or else into a spittoon containing chinosol, sanitas or other disinfectant; the rooms occupied should be dusted with damp cloths daily; the invalid should sleep in a room alone; the consumptive mother should not suckle her child. If these precautions be adopted, other members of the family can mix with the invalid without risk, and their doing so will aid recovery. District visitors and all workers amongst the poor might do much good by diffusing these simple rules amongst their charges. [For treatment of *Hæmorrhage* from the *Lungs*, See *First Aid*.]

CONTAGION. See *Disinfection*.

CONTUSION is a bruise. See *Black-eye*.

CONVALESCENT INSTITUTIONS are given in full in the Medical Directory, which is obtainable at any Post Office.

CONVULSIONS is the term used to denote an attack of involuntary muscular action, in which a stage of rigidity is followed by one of alternate contraction and relaxation. In these attacks consciousness is often lost. The poor use the term "internal convulsions" to denote gripes. The *cause* of convulsions is some irritation of the nervous system, which may be conveyed to the brain from the skin or bowel, or be due to the blood supply to the brain containing some impurity, or be due to disease or injury of the brain itself. Thus teething, indigestible food or worms or a pin in the clothing may induce convulsions, or the blood may be poisoned by the onset of pneumonia, measles or other fever, or the nervous system injured by an attack of infantile paralysis. The *treatment* is to detect and if possible remove the cause. The child should be stripped, and then placed in a hot bath containing mustard and kept in until the arms of the nurse begin to tingle. Medical aid should meanwhile be obtained, but if not obtainable an enema should be given next and a dose of grey powder placed on the tongue.

COOKERY. Recipes for the common articles of invalid cookery such as certain beverages, meat extracts, preparations of milk and farinaceous food and jelly are given under the following heads:—

Albumen water	Arrowroot Gruel
Apple ,,	Blancmange
Barley ,,	Cornflour
Black Currant water	———
Tamarind water	Jelly
Toast ,,	Milk, including junket, whey, etc.
Rice ,,	———
Imperial drink	Beef tea
Lemonade	Raw meat juice
Linseed Tea	Mutton broth
———	Veal broth
Custard	
Eggs	

CORN is an overgrowth of the horny layer of the skin caused by repeated pressure, such as that due to a tight boot worn daily. Between the toes, where perspiration is often copious, the soft variety develops. The treatment should be preventive by seeing that the boots fit and that the feet are kept dry. When present a corn should be destroyed by painting it night and morning with a saturated solution of salicylic acid in collodion, and by protecting it, if between the toes, by a perforated felt plaster having the corn in the centre. Many other remedies have been tried for corns, such as soaking the feet in hot water and cutting with razors, the use of a file, and the application of galbanum plaster, but we recommend the salicylic collodion.

CORNFLOUR may be prepared as follows:—a tablespoonful of cornflour is worked into a paste with a little water; a quarter pint of milk is then mixed with a quarter pint of water and heated in a saucepan without boiling;

the cornflour paste is then stirred in and the stirring is continued for three and a half minutes after the mixture has thickened, when it is ready to serve. If it is desired to *pancreatise* cornflour, the mixture should be allowed to cool to 99° F. and then a teaspoonful of liquor pancreaticus and enough bicarbonate of soda to cover a threepenny piece is added; the saucepanlid is then put on and the whole allowed to stand in a warm place for twenty minutes and then is ready. It will be found much thinned by the pancreatisation. [Refer to *Blanc Mange.*]

CORPULENCE. See *Obesity.*

CORYZA is a cold in the head. See *Cold.*

COSMETICS should never be used; many of them are poisonous, and most of them if used repeatedly spoil the complexion permanently. The only real cosmetics are the laws of health.

COUGH is a symptom of irritation which is generally situated in some part of the respiratory tract, such as the throat, bronchi or lung substance but may be due to irritation of some distant organ, e.g., the heart and stomach, or to disturbance of the brain, as in hysterical cough. The folly of attempting to apply a cough cure for all coughs alike is thus apparent. In the old and young, suppressing a cough with some soothing syrup containing opium is very easy and very dangerous; a cough should not be suppressed but treated by removal of its cause, and if there be some tenacious secretion in the bronchi, the secretion requires thinning by ipecacuanha wine, sweet spirits of nitre, and salines; the cough will then loosen and relief be obtained. If on the other hand the source of irritation is in the throat, the use every three hours of astringent gargles, such as alum of a strength of half an ounce to the pint, followed by a dose of glycerine and lemon juice, may give relief. Unless the cough shows signs of ceasing within a few days, medical advice is requisite. [*Asthma; Bronchitis; Consumption; Sore Throat; Whooping Cough.*]

COUNTER-IRRITATION is a mode of treatment consisting in the application of an irritant to the skin over some deeper organ affected by disease. The congestion in the skin thus produced is often accompanied by relief of congestion in the deep organ, whilst pain is also much relieved. The counter-irritation is applied either as a chemical irritant or as a burn by cautery. The three chemicals used are cantharides, mustard and turpentine. The mustard leaf or the mustard and linseed poultice are familiar remedies. In chronic joint disease touching the skin over it with the actual cautery is often most efficacious, though not safe in non-professional hands. [Refer to *Blister.*]

CRADLE is better without rockers.

CRAMP is a painful spasm of the voluntary muscles most commonly occurring in the calves. The condition may result from cold, as in bathing, or be due to irritation of the stomach or intestines, as in severe diarrhœa or arsenical poisoning. Cramps of the back and the abdominal muscles also occur in lockjaw and strychnine poisoning. Cramp in the hand is generally due to strain of certain muscles overworked in the course of the daily work, as in writer's cramp and other forms of trade cramp. For simple cramp in the calves the best treatment is to push forward the heel and draw back the toes, or brisk friction with the hands or with compound camphor liniment also. Other forms of cramp require medical aid. So-called "Swimmer's Cramp" is a spasm of the arteries by which the circulation is seriously obstructed and heart failure induced. The treatment is warmth and stimulants. Colic corresponds to cramp, but attacks the involuntary muscles instead of the voluntary.

CREAM OF TARTAR, or acid tartrate of potash, is a gritty powder, fairly soluble in water, and of a pleasant acid taste. In doses of twenty to sixty grains, dissolved in water, it acts as a cooling drink and a diuretic, but in doses of a quarter to one ounce it is an aperient, which acts within two or three hours of being taken.

CREOLIN is prepared from coal tar. It is a valuable disinfectant, and if added to a bath of warm water till the water is just milky it is useful for relieving itching in nettlerash and allied conditions.

CREOSOTE is a yellowish liquid with a strong odour and burning taste. Cotton-wool soaked in creosote may be placed in a hollow tooth to relieve toothache, but some dry wool should be placed over it to protect the tongue, for it is a caustic. It is administered internally in certain chest diseases.

CRETIN. The thyroid gland in the neck pours into the blood a secretion which influences nutrition and growth. Enlargement of the thyroid gland produces the well known goitre or Derbyshire neck; absence of the thyroid secretion produces cretinism. The secretion may be absent because the thyroid is absent from birth, or because later in life the thyroid wastes away, or whilst enlarging and producing a goitre it yet fails to produce its secretion. The symptoms are most marked in those with no thyroid from birth, they are stunted growth, the height rarely exceeding five feet, prominent abdomen, coarse features, dry skin, a slow pulse, sub-normal temperature, placid temper and defective intellect. In cretinism developing later in life —or myxœdema as it is called—the growth having been completed is of course unaffected, but the skin and mental changes are prominent. The treatment is to replace the secretion by thyroid extract obtained from the sheep, which fortunately is not destroyed by digestion and so can be given by the mouth instead of under the skin as was done at first. The effect of this treatment is remarkable, the growth is stimulated, the excessive weight lost, the temperature rises and the mind improves—a stunted idiot being thus changed into a comparatively normal being. The treatment to be safely carried out should be in medical hands. This treatment is one of the contributions to practical medicine which experimental physiology has furnished during recent years.

CRISIS denotes the sudden termination of a fever. Many fevers terminate in this way, the temperature falling five or more degrees within a few hours, the fall in the temperature being usually accompanied by sweating and more or less collapse. If this stage is passed through in safety the patient is usually out of danger. The term is also used to denote sudden paroxyms of pain occurring in the course of locomotor ataxy and other chronic diseases.

CROTON OIL is an oil expressed from the seeds of the croton oil plant. The oil is a powerful irritant, blistering the skin if applied to it, and producing violent purging if swallowed. Any dose greater than one drop is poisonous. It is seldom used medicinally.

CROUP is a spasm in the larynx or voice box due to inflammation. The commonest cause is diphtheria, but at times the inflammation is only of a temporary character and due to a cold or the onset of measles. The *Symptoms* of an attack are described under diphtheria. The *treatment* of simple croup is to apply a hot sponge or fomentations to the larynx and to obtain medical aid at once. The use of ipecacuanha wine as an emetic is recommended by high authorities, but as this is dangerous in diphtheritic croup, and as the two forms of croup cannot be distinguished except by an experienced eye, we advise this treatment to be postponed till after the doctor's arrival.

CROWING, or Spasmodic Croup, is due to a spasm in the larynx of nervous origin without any inflammation locally. The affection is common in rickety children at teething time. The child on being annoyed or on waking is unable to catch its breath for some seconds, until the spasm relaxes, and with a long drawn inspiration or crow, air is drawn into the lungs and relief is obtained. Between the attacks the voice is normal and the breathing easy, which is not the case with inflammatory croup. The *treatment* should be that of rickets; the spasms are rarely fatal though frequent.

CUMULATIVE ACTION denotes the sudden occurrence of symptoms of poisoning after certain drugs have been taken without harm for some time. Some drugs are not excreted as fast as they are taken, and thus accumulate within the body till they poison it. This effect is one amongst many which renders it wise to leave drugs to the physician.

CUSTARD. Beat up the yolks of four eggs with an ounce of castor sugar and three quarters of a pint of milk; pour

into a jug and heat in a saucepan of water, stirring all the time so that the custard thickens without boiling. Serve cold in wineglasses with nutmeg grated over the surface or flavour with a little orange flower water. *Baked Custard* may be prepared by pouring the above mixture into a pie dish instead of a jug and baking in a moderate oven for twenty minutes. *Savoury Custard* is made by substituting chopped meat, pepper and salt for sugar in the above.

CYANOSIS, literally "blueness," is the blue colour presented by the skin when the respiration or circulation is embarrassed.

CYCLING is a most healthy exercise. The nature of the saddle is important to women, and the handle-bars are often too low in the men's cycles, so that a cyclist's stoop is developed, the chest cramped and the heart strained. Much harm may be done to the heart by abuse of cycling, the strain of cycling uphill and against the wind is very great, and there is much truth in the remark that the notice boards of "dangerous to cyclists" would often be more truly placed at the bottom of the hill instead of the top. Much breathlessness, palpitation and faintness are danger signals that no one should ignore.

CYST, literally a bladder, is any tumour that contains fluid. The sebaceous cyst, or wen, is the most common. This cyst arises from the mouth of an oil-gland in the skin becoming blocked. The gland continues to produce oil, which can no longer escape. The gland thus becomes distended with retained oil and forms a cyst in the skin. It can readily be removed under cocaine by the family doctor, without chloroform or other general anæsthetic being necessary. [Refer to *Hydatid Cyst.*]

DAMPNESS should be avoided as much as possible, both in the choice of a site for a residence and still more in the dwelling itself. Rheumatic, catarrhal and neuralgic affections are common in damp situations, and catarrhal affections of the respiratory tract may lead to consumption.

DANDELION TEA is of some value in stimulating digestion, and it has also a diuretic action. It may be prepared as follows:—Clean the dandelion roots and cut them into thin slices; place two ounces of the sliced root, with a quarter of an ounce of orange peel, in a jug and pour in a pint of boiling water; stand the jug under a tea-cosy in a warm place for an hour, and then strain. The dose is a cupful before meals three times a day. Personally, we think this a very poor substitute for proper medicine.

DANDRUFF is the formation of greasy white scales formed partly of dead skin and partly of the secretion of the oil glands of the hair. The condition is most common on the scalp. It is common in infancy, and is often due to the head being kept too warm. In later life it is often associated with indigestion and with exposure to the heat from a gas lamp just over the head for many hours a day. In infancy the crusts that form may be removed by applying rags soaked in olive oil, and zinc ointment should be then applied, and the head in future clothed more lightly. In later life the condition should be attended to, or baldness may occur prematurely. The general health should receive attention; the hair brushes and combs should be washed daily in washing soda and hot water; the hair should be washed daily with soap and water and afterwards with an alcoholic solution of perchloride of mercury, one grain to the ounce and then thoroughly dried; this lotion must be kept locked up and be in a proper poison bottle, labelled poison. [Refer to *Baldness.*]

DANGEROUS TRADES include a large number of occupations, which can be rendered safer by an increase of knowledge of the causes and their prevention amongst the employers and the employed and by wise factory regulations. Much has been done already, but there is much to be done yet, and the folly of the workmen themselves, who often will not take the least trouble to protect themselves, is one of the chief obstacles to progress. The second chief obstacle is the increased cost to the employer that precautionary measures so often involve, and which handicaps the capitalist in England in his competition with those on the continent, where the factory regulations are of the slightest or are non-existent. Many trades involve exposure to *dust* which may be metallic, as in knife grinding, gritty as in quarrying, carbonaceous as in coal mining or chimney sweeping, or be of a variety of other forms from which millers and workers in cotton, hair, hemp, and many other materials suffer. The harder the form of dust inhaled the worse for the lungs. The three forms first mentioned are the most unhealthy, as they cause a chronic fibrosis of the lungs which gradually destroys them, and all the dusty occupations predispose to consumption. By the introduction of wet grinding and special respirators the mortality amongst knife grinders has been much reduced. By insisting on the men not rushing in directly after blasting (a time when the air is laden with gritty dust), much might be done to lower the mortality at present very high amongst the diamond miners. Various methods for reducing the dust in the air the worker breathes are always followed by a reduced mortality; thus the improved ventilation of mines has done much for the coal miner. Many trades involve exposure to *poisons.* Thus hat making, bleaching, fur dyeing and other trades cause exposure to irritating fumes, and in many trades some poisonous material has to be used which is liable to be absorbed and to accumulate in the system of the worker. Of these *lead* is the chief. The workers in lead materials include house painters, plumbers, fitters, accumulator workers, iron plate enamellers, white lead makers, chrome workers, japanners and glaziers, file cutters, compositors and the cappers of bottles. The mode of absorption varies, and is either by contamination of the food, by inhalation of fine lead dust, or by absorption through the skin, as the acid sweat dissolves lead dust. The burning of paint off doors instead of scraping it off as formerly, has done much to remove one cause of lead poisoning amongst painters, but the mixing of the paints still causes some to be inhaled, and carelessness in not washing before meals accounts for much of the poisoning. Coach painters, who work all the year round suffer more than house painters, who work only about half the year. The symptoms produced are painter's colic, and paralysis which causes loss of the power to grip or to use the wrist, and is termed "dropped wrist." The sensory nerves are not affected. Another disease that lead causes is Bright's disease with gout. One-third of the hospital cases of gout are in painters. The introduction of glaze free from lead for pottery making is much to be desired.

The best treatment to avoid lead poisoning is a daily bath, cleansing the hands before meals, if soiled by lead compounds, with turpentine, and the use of Epsom salts to keep the bowels freely open. *Arsenical* poisoning occurs in workers in arsenic, making emerald-green, artificial flowers and bird-stuffing. By the use of improved ventilation and of the "wet method," the health of the arsenic makers has been much improved. The symptoms produced are anæmia, lassitude and paralysis, and in certain trades sores on the skin due to the caustic action of arsenical dust. *Mercury* may be absorbed by breathing it, or by the skin or by the mouth. In barometer making, bronzing, skin and fur dressing, mercury or its salts are used. Formerly gilding and mirror making caused much mercurial poisoning, but recently electro-plating has replaced the old methods and mercurialism thus avoided. The symptoms are tremor of the limbs, diarrhœa and wasting. The treatment is plenty of milk, the use of sulphur baths and of sulphur internally, attention to the cleanliness of the mouth and good ventilation of the workshop. *Bisulphide of Carbon* is used in vulcanising india-rubber, and the vapour is prone to fill the workshop. The fumes are most injurious; headache, defective sight, faintness, fits, paralysis in wrist and ankle, madness, sterility and miscarriage may occur. Abundant air space and specially good ventilation are imperative and it is to be hoped that some less deadly chemical will be discovered that can replace carbon bisulphide. When symptoms have begun, the only treatment is complete removal of the victim to healthy surroundings. *Phosphorus* formerly caused much suffering by producing necrosis of the jaw, or "phossy jaw," and other grave symptoms, but the introduction of safety matches, in which harmless red

phosphorus is used instead of the dangerous yellow phosphorus, has done much to minimise this evil. *Anthrax* or wool sorters' disease attacks those who sort wool, when it takes the form of a fatal pneumonia, and also attacks those who carry raw hides, when it takes the form of a malignant pustule or sore, which causes a fatal blood-poisoning if not rapidly treated. The disease is due to a germ which attacks sheep and cattle, and their infected wool or hides conveys the disease to man. *Small-Pox* is not very prone to attack attendants on the sick, ambulance drivers, etc., if re-vaccination is efficiently carried out, as is well shown in the Asylum Board Reports for 1903. *Typhus*, on the other hand, causes a heavy death rate among the attendants. Another group of dangerous trades are those involving severe muscular *strain*, e.g. the army and navy; in these rupture and aneurism are common. The military style of riding causes rupture in a great number of men. *Exposure* to all weathers promotes bronchitis and alcoholism as in cab-drivers, etc. Exposure to extremes of temperature, as in bakers and stokers, also promotes bronchitis and other chest affections. *Attitude*, as in cobblers, may be a cause of disease. In this trade pressure is applied to the lower end of the chest for hours together, with the result that the chest is often deformed and indigestion and cancer of the stomach are common. The frequent repetition of one movement causes the different *craft palsies*, e.g. writer's cramp, the treadler's cramp of the weaver, telegraphists' cramp, etc. In these affections the sufferer first becomes rapidly tired, and later loses the power altogether of carrying on the skilled movements of his trade. *Sedentary Occupations* cause dyspepsia, nervous irritability and gout. Lastly, many occupations promote alcoholism, not only public house work but many business pursuits.

DEAD, DISPOSAL OF THE. Burial is the almost universal custom in civilised countries. By this method decomposition occurs inevitably, and all attempts to delay the process are inadvisable, e.g. heavy wood or metal coffins and deep graves. Decomposition is much more rapid within a few feet of the surface; because the soil here contains sufficient air to enable many active bacteria to live which are absent deeper down; it is much more rapid if a wicker coffin be used instead of a wooden one, and if placed in a gravel soil instead of clay. Burial in quicklime gives the most rapid decomposition of all, a fact used in the burial of those who have succumbed to certain infectious diseases. Cremation is undoubtedly the most sanitary method and is growing in public favour; the method is, however, expensive, and it destroys the evidence of death from poison which burial often does not, so that the cause of death has to be certified by two medical men, one of whom must hold certain qualifications, before cremation is permitted. The law permits a body, that has died of an infectious disease, e.g. diphtheria or scarlet fever, to be sent abroad provided it be sealed up in a metal shell and a customs house official be present when the shell is sealed. The law does not permit a body to be removed from a fever hospital to a private house in England; it only permits removal to a public mortuary, such as that of the cemetery. But little is done at present, however, to remedy the evil occasioned by the presence of a corpse in the slums, where several people have to sleep in the same room. On the Continent the corpse is removed to a public mortuary within a few hours in such cases.

DEAFNESS may be due to many causes. The ear is a complicated piece of mechanism, and defect of any part is prone to throw the whole out of gear and cause deafness. We may, however, recognise three chief forms; (1) congenital deafness of both ears due to nerve defect, (2) throat deafness, often also attacking both ears, due in childhood very commonly to adenoids, (3) wax in the ear usually causing deafness more on one side than the other and more frequent in the elderly than the young. Among the minor cases, certain drugs such as salicylate and quinine are worthy of note.

If deafness occur it is always safe to syringe out the ears, provided this be done as follows:—warm olive oil should be poured into the ear at night and a small plug of cotton wool placed in it; in the morning some water should be boiled and allowed to cool until it is comfortably warm and a teaspoonful of salt added to each pint; a syringe is then filled so that all air is excluded from it, a towel is placed over the shoulders of the patient and a bowl pressed firmly against the head just below the ear; the ear is then drawn upwards and backwards with the left hand, whilst the syringe is manipulated with the right. This treatment may be repeated for three or four days, and several syringefuls may be injected each time, care being taken that the nozzle of the syringe is not passed far into the ear. In throat-deafness any cold in the nose or sore throat should be attended to and relief may often be obtained in mild cases by the following plan:—close the mouth, compress the nostrils with the finger and thumb and make an effort to blow hard, and then swallow. By this plan air is often forced from the back of the nose into the ear through a passage known as the Eustachian tube. This tube is blocked from swelling due to inflammation that has spread from the nose or throat, and so has cut off the air in the throat from that inside the ear. As soon as the tube is opened up again either by the above method or with the passage of an instrument by the surgeon, the hearing returns. The above methods are the only ones we can safely recommend; when they fail the family doctor should be consulted. Ear trumpets and other artificial aids to hearing should never be bought without medical advice, as the cause of the deafness may be capable of removal. For deaf-mutes much may be done by lip-reading, taught in institutions devoted to the subject. [Refer to ***Ear*** and ***Ear-ache.***]

DEATH of the body as a whole occurs when the heart ceases to beat, but the individual organs of the body live on for varying lengths of time, ranging from a few moments to a few hours after the heart has ceased; thus the arteries empty themselves into the veins, the intestines continue to work, and the muscles can be thrown into action by an electric shock. In the lower animals the life of the individual organs is even less dependent on the life of the body as a whole; thus the heart of a tortoise removed after the tortoise has been killed by decapitation, will continue to beat for a day or two, and if cut into strips, each strip will go on working. Death generally begins with failure of (1) the circulation, (2) the respiration, or (3) the nervous system which keeps the two former functions working normally. Death from syncope, asphyxia or coma is said to occur according as (1), (2) or (3) is the mode of onset. The *signs of death* are cessation of the heart's action, cessation of the breathing, the gradual cooling of the body down to that of the room, the onset of rigidity or *rigor mortis* in the jaw and limbs, the formation of a film on the surface of the eyes, the pupil no longer contracting on exposure to bright light, the formation of dark patches, like bruises, on the skin of the under surface of the body due to blood gravitating there, and finally the onset of decomposition. The cessation of the pulse at the wrist only proves that the heart is not beating sufficiently strongly to make itself felt there, but if the heart is beating, by placing the hand just below the left nipple it can usually be felt, and by placing the ear to the same spot, heard. By placing a mirror over the mouth and nose the presence of breathing can be determined by the formation or not of a film of moisture. This is one of the best tests for the layman, as it combines simplicity with reliability. Placing a glass brimfull of water on the chest or upper part of the abdomen is also used to test breathing, as the slightest movement will spill the water, even though no movement appears definitely present. The other signs of death mentioned above require certain comments. The temperature of the body rises after death in certain cases for a few hours before the gradual cooling down to that of the surrounding objects begins. The onset of rigidity may be instantaneous, as in the case of certain soldiers shot on the battlefield, who have been found rigid in the act of waving a sword or taking aim with a musket or even retaining a firm seat on a galloping horse; on the other hand, in the aged and those exhausted by a long illness the onset of rigidity is delayed, ill-marked and of short duration. The usual time of onset is three hours after death, and the usual

duration is from one to two days. The formation of a film on the surface of the eyes is delayed in death from apoplexy, asphyxia and prussic acid. Death is *simulated* by catalepsy or trance, by asphyxia, and to a less extent by fainting. The appropriate treatment should be applied for some time without waiting to determine whether life is extinct, or the golden moment may be let slip. Catalepsy is infinitely rare and readily recognised by the pupil reacting to light and by the body retaining its warmth, so that the dread of being buried alive from which so many suffer is due chiefly to a sensational press and not to any essential difficulty in determining when life is extinct.

DEATH-RATE is the number of deaths per 1000 living that would occur in the course of a year were the death-rate of the week quoted to remain uniform during the year. The death-rate is published weekly by the Registrar-General, compiled by him from the death certificates. The returns show a fall in the death-rate of consumption, diphtheria, typhoid and many of the infectious diseases during recent years, but a rise in that from cancer and lunacy, whilst infantile mortality is still disgracefully high. The death-rate is higher in overcrowded districts than elsewhere. The high infantile mortality is due largely to ignorance of the way to rear a baby, but also to over-laying and to the free use of soothing syrups, many of which are readily obtained by the poor, though opium is the chief ingredient. In Germany over-laying is a criminal offence. There can be little doubt that many a death from over-laying and from soothing syrup is deliberate murder, a crime incited by the disgraceful system of child-insurance, which is still legal. The comparative mortality of different occupations shows that clergy and farm labourers have the lowest death-rate, that doctors have a higher death-rate than most occupations, higher even than coal miners, that the dusty trades, like knife grinders and sweeps, have a high death-rate, and that the highest is that found amongst costers, general labourers in large towns and public-house servants.

DEBILITY has many causes which fall into three main groups (1) overloading the system with more nutriment than can be made use of, (2) lack of nutrition, the result of defective teeth or disordered digestion, unsuitable diet, lack of fresh air, or mental strain, and often to most or all of these causes combined, (3) the presence of organic disease, e.g., typhoid, consumption, etc. The common mistake made is to forget group (1) entirely and to assume that want of energy demands extra nourishment, port wine, tonics, cod liver oil, etc., when more often than not a spare diet, a free purge and more exercise in the open air are urgently needed. "Talk of champagne," said Byron in one of his letters, "there is nothing which cheers your spirits up like a dose of Epsom salts." Group (1) is the common cause of debility amongst the middle-aged city men and also, be it noted, amongst the children of the upper classes. Group (2) is more common amongst the shop-assistants and female clerks. In debility we shall be fairly safe in recommending more fresh air and sunlight, and unless anæmia be marked or the temperature raised more exercise also. In anæmia fresh air without exertion, such as can be obtained on an electric tram, is what is wanted. Again, in most cases of debility the bowels are irregular and require attention. The diet should consist of regular meals, easily digestible, eaten slowly with nothing between meals. In group (2) it will generally be found that tea, butter and buns form the mid-day meal; this should be exchanged for a hot dinner of meat and two vegetables, followed by a little stewed fruit. In group (1) amongst adults a heavy lunch is followed by a heavier dinner in the evening, so that two substantial meals a day are eaten and exercise is limited to one afternoon a week or less. The prolonged use of tonic drugs without medical advice is not recommended, as congenial surroundings, sleep, exercise, cold baths, fresh air and sunlight are tonics beside which alcohol, strychnine and other poisons are worth little indeed, and when debility fails to react to the natural tonics just mentioned, the cause is likely to belong to group (3) and medical examination be urgently needed. [Refer to *Anæmia; Alcohol; Constipation; Gout.*]

DECAY. See *Teeth* and *Change of Life.*

DECLINE. See *Consumption.*

DEFORMITY. See *Bandy-legs; Club-foot; Flat-foot; Rickets; Spine; Wryneck.*

DELIRIUM is mental wandering. The symptom is a common one in the febrile disorders of childhood, and may occur in any illness in which the brain is fed by impure blood. There are two chief forms, active delirium and low muttering delirium. In the former there is excitement and often violent struggling if resistance has to be offered; in the latter the patient picks at the bed clothes and mutters incessantly, but, being exhausted, offers little resistance. In the adult the condition is graver than in the child. In either case the patient must never be left, and if possible two people should always be present. The treatment will necessarily be left to medical hands.

DELIRIUM TREMENS is a special form of delirium due to chronic alcoholism. It is apt to occur when pneumonia or a broken leg confines the patient to bed, and also follows a specially severe drinking bout. Distaste for drink is often an early symptom, which has given rise to the erroneous belief that withholding alcohol induces delirium tremens. The chief *symptoms* are fear, tremor and restlessness; the patient always asks for his trousers to get up and do some imaginary business round the corner, or will if not restrained go out without troubling to dress and may take the shortest route, viz., through the window; he is in fact always trying to get away from himself. Next the appearance of imaginary objects, usually black and crawling, occurs, which inspire further fear. These objects vary with the patient's occupation: the miner just home from the Cape picks up diamonds all day, the soldier back from the war sees Boers and shouts for help, the potman incessantly polishes imaginary glasses, the cabdriver sees horses on the ceiling, which he directs in stentorian tones, whilst two men, who both saw imaginary rats, and who were confined in the same ward, spent all night looking for the man who had put the rats there, and finally picked their mattresses to pieces to see if he was inside. For from one to four days the patient is incessantly moving, talking freely, refusing food and showing no sign of sleep, nor do sleeping draughts have much effect unless dangerously powerful. Finally the sufferer sinks exhausted to sleep and wakes up after many hours sane, but he may die of exhaustion before this sleep comes on. The *treatment* is to avoid mechanical restraint as much as possible, and the best of all is to turn the patient loose in a padded room, kept well warmed and allow him to wander round and round until he sleeps. Such a padded room is to be obtained at the nearest poor-law infirmary. Failing this, sufficient nurses must be always present to prevent him from coming to harm. An enema should be given early in the attack, as it quiets the patient more than any sleeping draught. A little beef tea and somatose is the best nourishment, which can often be administered by coaxing judiciously. The patient is rarely dangerous to others.

DELIVERY. See *Child Birth.*

DEMULCENTS are remedies which give the upper part of the digestive canal a protective coating. They include barley water and linseed tea, gelatine and isinglass, marsh mallow, liquorice, gum, and raw white of egg, honey and glycerine. They are safe remedies in sore throat, irritable stomach and after irritant poisons. [See *First Aid* for *Poisons.*]

DENTIFRICE. See *Teeth.*

DEODORANTS should never be used to disguise an offensive odour if this can possibly be removed by free ventilation, but at times, as for instance in cases of a patient dying of spreading gangrene, deodorants as well as free ventilation may be required; iodoform is then used in dressing the gangrene. The use of trays of charcoal, etc., about a room do little or no good. [Refer to *Disinfectants; Bad Breath.*]

DERBYSHIRE NECK. See *Goitre.*

DIABETES is a disorder in which sugar is not used up in the body as it should be, but accumulates in the blood and is discharged in the urine. The *causes* are various. Overwork, overeating and lack of exercise combined seem an

important cause in many cases; in others heredity, or disease of the pancreas (or sweet-bread) is the cause. The last cause is of interest as being discovered comparatively recently. Physiologists have shown us by experimental removal of the pancreas in animals that one function of the pancreas is to pour into the blood a secretion which regulates the nutrition of the body, the absence of which causes the sugar to be discharged in the urine. Attention was thus directed to the pancreas in diabetes with the result that a certain variety of this disease was found associated with pancreatic disease. The *symptoms* are thirst, the passage of an excess of urine, a voracious appetite, and either loss of flesh or obesity. The chief complications are carbuncle, consumption, and nervous symptoms, especially mental depression. The course of the disease varies; in childhood it is often rapidly fatal, but in middle age it may last for years. In the cases due to over-eating the chance of recovery is good. The *treatment* is chiefly dietetic. All sugar and farinaceous food requires reduction, and the amount of fluid drunk should equal the amount of urine passed and no more. Animal food, except oysters and liver, all sharp fruits like lemons, all vegetables that grow above ground, except peas and beans, are suitable. Thick soups, which are thickened with flour, are not allowable. Flour consists of starches and gluten, the former is not allowable but the latter is useful, hence as a substitute for bread, flour from which the starch has been removed is used and made into a bread known as gluten bread and almond bread. (It may be obtained at Callard's, of Regent Street. The Protene Company also make a bread free of starch, which they prepare from milk and egg.) If any ordinary bread is allowed, it is usually given in the form of toast. As substitutes for sugar, glycerine and saccharine are used.

DIACHYLON PLASTER. See *Plaster.*

DIAGNOSIS is the recognition of the cause of any ill-health. Correct diagnosis must precede rational treatment, and until it has been made treatment should be of a simple and cautious nature. It is for this reason more than any other that medical aid is so valuable and in the future will be of more and more value according to the progress made in the perfection of diagnostic methods (*cf* the value of the stethoscope, thermometer, or X rays). Disease should be dealt with by the detection of the cause and then by methods directed to the removal of that cause. A diagnosis is made in the following way. The symptoms for which the patient seeks advice are first enquired for; next the account of the illness given by the relatives is often taken, this is often useful, as in the description of a fit for instance, and then the patient is carefully examined, beginning with the organ which from the history of the case is apparently at fault; for instance the patient has a cough, night sweats and loss of weight, the chest is then sounded in the expectation of finding signs of consumption; or paralysis, when the nervous system would be taken first, but all the organs receive attention, for it is important to know whether these are sound or not in addition to knowing the state of the organ principally affected. Questions relating to family history, and to personal habits in regard to food, work, tobacco, alcohol, regularity of the bowels, monthly loss and the like have then often to be asked or are asked at the beginning, and it is of great importance that such questions should be answered fully and honestly. Diagnosis at home is necessarily limited, because the layman cannot sound a chest or test the urine, etc., and the parent should be prompt to distinguish ill-health from laziness or temper amongst his children rather than attempt to decide what illness his child has. No one should spend time in attempting to diagnose his own condition, to do so by concentrating attention on a symptom is to exaggerate it and do harm. Moreover, the possible causes of any one symptom are so great that diagnosis cannot be made except by a broad view of the patient, his habits, his past history and his inherited tendencies. There are at least twenty distinct groups of causes of headache, each of which are subdivided further. There are quite half as many possible causes of pain in the back, ranging from a strain to an aneurism and so on. Hence the habit of buying so and so's tincture, pills, pastilles or what not because you are breathless on exertion, have a bad taste in the mouth on waking, or suffer from pain in the back, etc., is a custom only worthy of the middle ages, if that, and is as different from the usual way of doing business as it is possible to imagine. In *detecting illness* from health amongst children the following points deserve attention. A good tempered child that becomes irritable or a mischievous child that is suddenly quiet is probably ill; a child, which not only does not want to go to school but also does not want to play is almost always ill. Loss of appetite, headache, vomiting, diarrhœa and sore throat should receive prompt attention, and a rash in such cases should be looked for as any of these symptoms may be the onset of one of the fevers, and if the temperature is found raised, isolation for a day or two is wise. The *attitude* of a healthy child asleep is with the cheek in contact with the pillow and often with the back up and the abdomen in contact with the bed. If the child be on its side with its head drawn back and the neck rigid, meningitis has to be feared; if it lies on its back with its legs drawn up and its abdomen distended and hard it probably has colic due to wind or something wrong in the abdomen; if it presses its forehead into the pillow persistently, it may be because the light is painful owing to conjunctivitis or the onset of measles. The *movements* during sleep are normally absent, hence twitching or rolling of the head from side to side are signs of illness, the latter symptom may be due to earache. The *expression* is a valuable sign, especially to the parent who knows the usual expression so well. The *cry* is altered in illness. It is lost when the child is very short of breath, as in bronchopneumonia, and in extreme weakness, when the features look as though the child were crying, but no sound is produced; it is often paroxysmal in colic and incessant with earache; a shrill scream at intervals with drowsiness between whiles occurs at the onset of meningitis. *Shortness of breath* occurs at the onset of bronchopneumonia and other chest affections, to detect this the margin of the nostril should be watched, as this does not dilate with each breath, except during shortness of breath; the breathing will be at the same time noticed to be hurried. The *pulse* in an infant is too fast to count, and the slightest excitement sends up the pulse rate to 180 even in an older child; irregularity in the pulse is common in a healthy child. The gap between the bones of the top of the skull which does not close till the end of the second year, should be felt instead of the pulse at the wrist. If the scalp here is found sunk in or bulged out the infant is ill. The *temperature* is raised by trifling causes and need not cause the alarm that corresponding rises of temperature would cause in the adult. [Refer to *Infants* and the separate heading of the disease suspected.]

DIAPHORETICS are remedies which produce perspiration. They include hot baths and packs, copious draughts of hot water or tea, sweet spirits of nitre, citrate, tartrate, and acetate of potash, and pilocarpine.

DIAPHRAGM, or midriff, is the membranous partition which separates the chest from the abdomen. It is composed of muscle and tendon, and its action is to move downwards when a breath is taken and upwards when the breath is expired. By these movements the chest is first enlarged downwards, and so air is sucked in and then diminished so that air is driven out. Spasm of the diaphragm causes hiccough; paralysis of the diaphragm is one of the serious complications of diphtheria.

DIARRHŒA has many causes. These belong to one or other of the following groups; (1) irritation of the bowel by its contents being abnormal; (2) irritation of the nervous system; (3) irritation of the skin by a chill. Group (1) includes the causes of most importance to us: they are errors in diet, intestinal worms, hard fæcal lumps due to previous constipation, and certain poisons. Group (2) includes fright or other painful emotion. Group (3) explains itself. In addition to these, diarrhœa may result from disease of the bowel, e.g. cancer or tuberculosis in it or from some general disease, like typhoid-fever or blood-poisoning. Three forms of diarrhœa deserve mention:—

(1) If babies are fed in the wrong way and are kept under filthy conditions a chronic diarrhœa is common which the ignorant call "consumption of the bowels." This is nearly always not tuberculous ulceration but a condition brought on by carelessness which can be prevented.

(2) The diarrhœa of teething is the result of unsuitable food, together with the irritation to the nervous system which teething causes. The ignorant regard it as a safety valve, whereas it is a condition which must be treated at once.

(3) Epidemic diarrhœa carries off large numbers of infants every summer. It is probably due to a germ, which exists in filth and which becomes virulent whenever the ground is warm. It reaches the intestines with the food and attacks those infants who have indigestion at the time. It produces poisons, which cause vomiting, diarrhœa, fever, exhaustion and death.

The prevention of diarrhœa is of great importance, especially in the rearing of infants. From a study of the causes given above it is clear that a suitable diet, a regular action of the bowels, a pure water supply free from the eggs of worms and other parasites, an avoidance of fright and of chill, especially of chill to the abdomen, are the objects we have to attain. [See *Artificial Feeding of Infants.*] In addition, a few words of advice in relation to epidemic diarrhœa may be useful. This disease does not attack the breast-fed, hence in weaning avoid August and September as months to begin doing so. It is most prevalent in crowded cities, especially in the parts where unpaved courts and badly swept roads are common; therefore if you have an infant recently weaned take it if possible out of town at this time of year. As the germ is introduced with the food, boil the milk directly before use; avoid sour milk altogether, condensed milk freely diluted is far better. [See *Infants.*] The germ attacks specially those with indigestion already, therefore call in the doctor for the least indigestion at this season.

The first thing to do in the *treatment* of diarrhœa is to take the temperature, and if this is either above or below normal, whatever the age of the sufferer, a doctor is required at once. Or if blood be present in the motions a doctor is required also. If the diarrhœa is due to some poison having been swallowed, refer to the Article on *Poisons.* In cases of diarrhœa with a normal temperature treatment for a few hours can be safely attempted. First consider the cause. Is there (1) an irritant to cause it, such as those given above; or (2) has there been a fright; or (3) a chill very recently. If the answer is, (1) the removal of the irritant is to be attempted, nature is already doing so by diarrhœa, we must aid nature by a suitable purge. This must not be of an irritating character, as there is some irritation already. The safest is castor oil. If vomiting is present the best is grey powder for a child, or half grain doses of calomel given hourly for four to six hours for an adult. If there is much griping, in the case of adults it will be safe to add to the castor oil ten minims of laudanum. The application of fomentations to the abdomen will also be grateful. An enema of half a pint of warm olive oil may be tried. The diet in infancy is to be not milk but the whites of four eggs beaten up in a pint of water, given every two hours in quantities proportionate to age. In later life the diet should be spare, e.g., soda water, toast, arrowroot and jelly. It is wise to put the patient to bed. If diarrhœa is thought due to cause (2), if the child be put to bed it will soon be well. If on the other hand cause (3) is regarded as responsible, the sufferer should go to bed with hot bottles, hot fomentations or bran poultices or turpentine stupes to the abdomen. He should have a spare diet and some brandy. If in the course of a few hours improvement in these cases is not occurring, a doctor is required. If he is not obtainable, two to four bismuth lozenges are to be given three-hourly, and if necessary a starch enema [See *Enema.*] If collapse occurs brandy is required.

DIATHESIS is the constitution, either inherited or acquired, which renders the subject liable to certain diseases. Thus those with a gouty diathesis are liable to gout. [See *Heredity.*]

DIET. See *Food.*

DIGESTION consists in rendering the food eaten soluble and capable of absorption into the circulation. The means by which this is effected are in part mechanical and in part chemical. Food having been rendered digestible by cooking is taken into the mouth, when it is thoroughly crushed by the teeth and thoroughly mixed with saliva. Saliva is the product of salivary glands which are placed behind and below the jaw. The saliva changes starch to sugar. If the teeth are deficient or the food is bolted this first stage of digestion is prevented and harm results. The food is next rolled into a ball by the tongue and swallowed. It thus reaches the stomach which secretes from its walls an acid juice called the gastric juice, which dissolves the meat part of the food and puts an end to the action of saliva. From the stomach the food passes into the small intestine.

Here three juices act on it, viz., the bile, the pancreatic juice and the intestinal juice. All three are alkaline, and thus neutralise the acidity produced by the gastric juice and stop its further action. In the small intestine the digestion of the starchy foods, like bread and rice, which was begun in the mouth, is completed. This digestion consists in changing the insoluble starch into a sugar, which is soluble. The digestion of meat is also completed here. Fat is changed into minute drops of oil that are capable of absorption. The bile is produced by the liver, the pancreatic juice by the pancreas, or sweet bread, and the intestinal juice by the intestinal wall. In the small intestine the meat and starch when digested are absorbed into the circulation, the fat on the other hand does not pass directly into the blood but into the lymphatic circulation and from this into the blood by the thoracic duct, which opens into the veins of the neck. The residue passes from the small intestine into the large intestine. Here it is dried so that the undigested residue is solid by the time it reaches the end of the digestive canal. The external opening is known as the anus and the solid residue as the fæces.

The whole digestive tube from mouth to anus is called the alimentary canal, the word aliment meaning food. The food is propelled through the alimentary canal by the movement of the walls of the canal. These are muscular for this purpose; their movement is termed peristalsis. If peristalsis be too active the food will pass through before absorption is complete and frequent fluid motions must result; that is, diarrhœa. If too sluggish, the motions will be too dry and will be delayed, that is, constipation will be present. When one remembers that seven quarts of gastric juice and upwards of one quart of bile are produced normally in twenty-four hours and that this production is under the influence of the nervous system and is secreted from the blood, it is clear that a healthy nervous system and a pure blood supply are essential to a good digestion. Emotional disturbances and withdrawal of blood from the digestive organs after a meal by imprudent exertion are potent causes of indigestion. In addition to the digestive agents mentioned above the intestine is full of bacteria or germs. The different species of these occupy different parts of the alimentary canal, the smallest number being in the stomach; indeed one use of the gastric juice is to kill germs introduced in the food. The germs normally present in the intestine aid in digestion; their functions are not yet fully determined, but they are responsible for the formation of gas, a certain amount of which is normal. In disease this gas formation may be carried to excess. [See *Indigestion; Flatulence; Lymph.*]

DILL-WATER is useful for relieving griping, especially in infants. The dose is two to eight teaspoonfuls, according to the age of the patient.

DINNER PILLS are pills taken regularly after each meal. Their use is chiefly confined to the treatment of chronic constipation. They should consist of a grain each of euonymin and cascara, made into pill-form with soap. A quarter grain of extract of nux vomica may be added if the former is not strong enough, and aloes should be avoided as much as possible. The use of dinner pills before meals to stimulate the appetite is not recommended. [Refer to *Constipation.*]

DIPHTHERIA is a disease named from the Greek for a membrane, that is a skin-like substance. The cause is a bacillus or germ which attacks the throat, nose or windpipe and multiplies therein. It produces there a white or grey membrane from which poison is absorbed into the blood and carried to all parts of the body. The bacillus itself does not enter the blood. The predisposing causes are those which render the body a suitable soil for the diphtheria bacillus to grow on. They are exposure to sewer gas from bad drains in the house, or to foggy or damp weather. Infection is conveyed either directly from a case of diphtheria or indirectly by means of infected clothing, books, dust, milk or such domestic pets as cats.

The *symptoms* at the onset are slight; they are pain in swallowing, a feeling of languor, a quickened pulse, a rise of temperature and often vomiting. In infancy the symptoms are different and are described later. Within a few hours of the onset patches of grey membrane appear on one or both tonsils. To see this it is essential to have a good light and an assistant to hold the head and hands of the child. If now the child says "Ah!" whilst the observer presses down the tongue with the handle of a spoon or tooth brush a good view of the throat is obtained. To disregard these rules is sure to result in frightening the child without seeing its throat at all.

In mild cases the membrane does not spread much; it separates within the week and comes away piecemeal; it is either coughed out or swallowed. Recovery in these cases is rapid, the temperature falls, the appetite returns and the patient is convalescent in a week. In severe cases on the other hand the membrane spreads, extending to the nose, and often to the windpipe. This causes fœtor, discharge from the nose, swelling of the neck, great prostration. In the worst cases the blood is so badly poisoned that the blood-vessels rupture and hæmorrhage occurs under the skin or from the stomach or throat. Such cases terminate in death within the week, vomiting and gradual exhaustion preceding this. The convalescence of the severe cases, and less often of the mild also, is apt to be interrupted by certain forms of paralysis. Paralysis of the heart, of the palate, of the eyes, of the lips, of the diaphragm may occur in this order of precedence in time. The first is to be feared, specially at the ninth day, the last at the thirty-sixth day. The first and last are highly dangerous, the others are transient. Paralysis of the palate causes fluids to return through the nose during the act of swallowing. Jelly and semi-solids of this kind are then swallowed more easily than fluids. Paralysis of the eyes may cause either inability to read or else a squint.

In children under three diphtheria is prone to attack the windpipe, either by spreading down from the throat or by beginning in the windpipe. This condition is known as membranous croup, because it is only recently that this has been proved to be a form of diphtheria. The symptoms are hoarseness and cough, both often having a metallic ring in their sound, laboured breathing and restlesness.

Such an illness is often mistaken for bronchitis until it is too late. As the attack progresses paroxsyms occur in which the child springs up and fights for breath. In such attacks the colour of the child changes to a dusky blue, the eyes start nearly out of the head, the hands clutch at the rails of the cot, until air is drawn into the lungs with a long hissing inspiration and the child sinks down relieved temporarily but exhausted. The frequent occurrence of such attacks rapidly exhaust a child and make tracheotomy necessary. This operation consists in inserting a tube into the windpipe below the obstruction. The relief this affords is immediate and complete. It is well worth having it done, even though the attack of diphtheria is avowedly too severe for recovery to occur.

Treatment. In a suspected case of diphtheria carry the child to a bedroom at the top of the house. It is unsafe to allow it to walk upstairs. Put it to bed, isolated from the others, and keep the child lying flat. The great danger of diphtheria is sudden failure of the heart, which any sudden exertion may induce. Let the child never be left on this account. Send at once for the doctor, without waiting to see how the child is in the morning, because every hour is of importance. In the event of your suspicions being confirmed, a hospital nurse will probably be required in addition to the mother. Failing this the advisability of sending the child to a fever hospital will have to be faced. The life of the child must be your only consideration; the grief of parting with it for a time must be bravely borne. It is surprising how soon young children settle down to hospital life. If nursed at home the room must be prepared as directed in the article on scarlet fever. [Read also the articles on *Fevers*, on the *Sick Room* and on *Antitoxin*.]

Except in the very mildest cases antitoxin must be given at once. On the promptness with which this can be done the chance of recovery largely depends. The diet is that for scarlet fever (which see). When fluids are returned through the nose, milk thickened with arrowroot should be given. Syringing out the throat will probably be ordered; this requires a trained nurse, the mother may be required to help; the child is sure to struggle for the first few times at least from fright at this new experience; this is not the fault of the nurse. In the event of the throat being blocked and swallowing not possible, the child is fed through a soft indiarubber tube passed through the nostrils and down into the throat. This again requires a nurse aided by the mother; it is wise to pour down a little water first to make sure the tube is not in the windpipe before anything thicker, like milk, is added.

The child may cough membrane into the face of the mother while she is engaged in the above duties. This should be avoided if possible, but if it does occur there is reason for prompt action, none for panic, as this accident is common in fever hospital life. The treatment in such a case is to wash the face at once in plain soap and water. If the membrane be coughed into the eye, let the nurse syringe this out for you at once with warm boric lotion. Emphasis must be laid on a few other points in nursing this disease. The value of fresh air cannot be grasped too thoroughly, both for the sake of the patient and the nurses. The health of the nurse must be cared for by two hours daily spent out of the house; the dress must be changed first; a ride on the top of an electric tram is better than a walk; any soreness of the throat must be reported to the doctor at once; the dress is to be of cotton; over this an apron and sleeves are to be worn; these are to be clean daily and must always be taken off before meals; cracks in the hands must be protected by flexible collodium; these cracks are to be avoided by not using disinfectant lotions; plain soap and water is all sufficient. The ordinary case is confined to bed for two or three weeks and sent to the seaside in six weeks.

Disinfection of the house is then undertaken by the sanitary authority. The room must be repapered and the ceiling lime washed. The drains should be tested and defects corrected.

DIPSOMANIA is a form of alcoholism in which temperance alternates with intense craving for alcohol. The craving may occur only annually, or at even longer intervals, but when present is so strong that confinement in a home for inebriates is generally essential, if the temptation is to be resisted. [Refer to *Alcoholism*.]

DISINFECTION means the destruction of the infection which spreads disease. The infection consists of a living germ. These germs are low forms of plant life allied to moulds. We know how a damp dark cellar with little or no ventilation is the best place for any object to become mouldy. It is clear that sunlight and fresh air destroy moulds and it is not surprising that they are found experimentally to destroy germs also. This is Nature's method. This method has been supplemented by two artificial methods; (1) heat, (2) chemicals. Heat is the chief method for sterilising instruments, dressings, bedding and clothing. Fur and leather are much damaged by heat and are better disinfected by chemicals (formalin). *Heat* can be applied in the form of hot, dry air or as steam. The latter is far more efficient, because the steam when it condenses gives out so much heat. To prevent excessive condensation, with the resulting saturation of the goods to be disinfected, the steam is applied under pressure in a

Lyon apparatus. By this means also a bulky object like a mattress is penetrated more quickly. The pressure must not be too great to prevent some condensation of the steam, or disinfection will not be nearly so thorough. Hardware is best sterilised by boiling. *Chemicals* are required to sterilise those objects to which heat cannot be applied.

A chemical may not be sufficiently powerful to kill the germs, but it may retard their growth; when this is so the chemical is not a disinfectant but an antiseptic. A chemical may neither kill nor retard the growth of germs, but may deodorise their products, in such cases the chemical is a deodorant merely. To use a deodorant or an antiseptic under the belief that it is a disinfectant is a serious mistake commonly made by the public. Ignorance in this matter is turned to account by quack vendors. We mention as examples of sham disinfection the wearing of camphor, and the placing of a tray of disinfectant in a room in which a patient is being nursed in the hope of purifying the air. Disinfection has to be much more thorough than this; such imperfect methods are not equal to the natural method of free ventilation and abundant light. Chemicals for disinfection are applied in either the liquid or the gaseous state. The solution must be of sufficient strength, when it falls below this standard it is not disinfectant but only antiseptic. The following table may be of service.

Chemical.	Strength necessary for the solution to be disinfectant.	Strength suitable for use as an antiseptic.
Carbolic Acid	1 in 20	1 in 60
Perchloride of Mercury	1 in 1000	1 in 2000
Biniodide of Mercury	1 in 1000	1 in 4000
Zinc Chloride	1 in 250	1 in 500
Chloride of Lime	1 in 100	1 in 200
Creolin	1 in 60	1 in 160
Burning Sulphur	3 lbs. for each 1000 cubic feet of air space	

Izal (1 in 200) and Chinosol (1 in 1000) are useful as they are active, without being poisonous to Man. Sanitas, though less powerful, is also non-poisonous. Jeyes' fluid, like Creolin, contains one of the higher phenols and is a strong disinfectant.

Iodoform is of only doubtful value, permanganate of potash in the presence of much organic matter also is of less use than commonly thought. Boric acid in saturated solution is a good antiseptic, but not powerful enough to be disinfectant if allowed only a reasonable time to act. As an antiseptic, permanganate of potash should be added to water until the latter is a bright pink and lysol be used in a strength of four teaspoonfuls to the pint of water. It will be seen from the above that a momentary dip into an antiseptic solution does not sterilise the hands, and that pouring a little disinfectant down a large drain is likewise futile; abundant flushing with plain water is far more useful. To *sterilise the hands* they should be thoroughly scrubbed with nail brush and soap and then soaked, whilst one hundred is counted, in one in a thousand biniodide of mercury in alcoholic solution. But even then disinfection is not perfect, and many surgeons now avoid this difficulty by operating in sterilised gutta percha gloves.

Disinfection of a house after a case of fever is usually undertaken by the Sanitary Authority, if not the following rules are to be carried out:—Either roll sulphur or formalin must be procured to use as a disinfectant. The latter can be used in liquid form by means of a special lamp sold for the purpose, or in the solid form known as paraform, which is the handiest for a small room. (Two tablets to each 100 cubic feet of air.) First disinfect all metal work with carbolic lotion, and remove from the room such as is not fixed. The latter having been disinfected may be protected by vaseline, as the fumes of sulphur corrode it. Over a large metal tray or tub of water place a tripod with an iron pan. On this place the sulphur; allow three pounds of sulphur for each thousand cubic feet of space. Then close the window and close all cracks with paper pasted on; close the chimney. Now light the sulphur by placing a shovelful of red hot coal on it; leave the room, paste paper round the cracks of the door quickly. The room is left for a day. After this the room is freely ventilated till all the fumes have been swept out. It is best to destroy the bedding, as the fumes do not well penetrate it. The room should now be repapered, the ceiling lime washed, and the floor thoroughly scrubbed. The last traces of the odour of formalin may be removed by ammonia, if necessary.

DISLOCATION. See *First Aid.*

DIURETICS are remedies which promote the action of the kidneys. They include water, nitre, spirits of sweet nitre, citrate, tartrate and acetate of potash, alcohol, squill, digitalis, turpentine, broom and oil of juniper; gin, which is composed of alcohol and oil of juniper, is largely used by the public. Diuretics are in lay hands dangerous remedies, because many of the diuretics, like turpentine and gin, are irritating to the kidneys and are the worst treatment possible when inflammation is present, and a slight congestion or inflammation is thus often changed into an acute one. The diuretics above mentioned before alcohol are the only ones that can be called safe in lay hands, whilst the tendency in modern medical practice is to use these almost entirely.

DOCTOR. In the medical profession there are four classes of practitioners, the family doctors or general practitioners, consulting physicians, consulting surgeons and specialists on the eye, throat, etc., who, like dentists, confine themselves to one part of the body. Each household should have one good family doctor, whom they always consult when ill, and one dentist to whom they pay at least an annual visit. The family doctor should decide when a consulting physician or surgeon is required, and also whom to call in, though the patient or his friends may if they desire a second opinion tell the family doctor so, and may also say whom they prefer. It is much better, however, to leave this to the doctor, as the fashionable physician of the day is not always the best man, but merely the one whom attendance on some celebrity has brought into note. The family doctor, on the other hand, has usually two or three consultants, whose opinion he values highly and whom he knows to be good. It is important that no doctor be consulted during the attendance of the family doctor without his knowledge, as to do so is to commit a breach of confidence for which there is no excuse. In the event of the doctor not giving satisfaction, he may be told that his services are no longer required, and the patient is then free to call in any other doctor he chooses. The hours of consultation for a family doctor at his house are usually up till eleven in the morning and again in the evening, whilst consultants may be seen by appointment usually in the mornings only. The rest of the day is occupied by going his rounds in the case of the doctor, and by work at the hospitals and learned societies in the case of the consultant. Consultants do not usually visit patients at their own houses except in consultation with the family doctor. The *fees* of the family doctor range from half a crown to half a guinea a visit, according to the house rent of the patient, and night visits are usually charged double. The fee for consultation at the doctor's house is usually less, and where two or more invalids are present in the same house a reduction is made. Vaccination is from five shillings upwards, and midwifery from one guinea upwards, two or three guineas being the common fee. The consultant's fee is usually arranged by the family doctor; at his consulting rooms it is usually two guineas for the first visit and a guinea afterwards; for operations the fee ranges from ten to a hundred guineas, according to the nature of the operation and the experience of the surgeon. The consultant is paid at the end of the consultation, the doctor usually half yearly or yearly. For those who cannot afford medical advice or who cannot afford the unexpected expense of an operation, the hospitals are open and entrance on the recommendation of the family doctor is readily obtained, but the public as well as the doctor ought to see that this charity is not abused. The *choice* of a family doctor should be made chiefly by the recommendation of friends. Failing this

the Medical Directory should be consulted, in which are recorded the examinations that the doctor has passed and the posts he has held. If he has been house-surgeon, house-physician or resident obstetric officer to his own hospital, he is fairly certain to be a good man, as these posts are awarded to the more successful students of the year when they are qualified. The examinations passed are of less importance; the diploma of the Royal College of Surgeons of England and of the Royal College of Physicians of London, indicated by the letters M.R.C.S., L.R.C.P., respectively, is the usual diploma of the family doctor, and is quite as good as many of the provincial, Scotch, or Irish degrees of M.D., though from at least an academic point of view is not equal to the M.D. of London, Cambridge or Oxford.

DOSE of medicine according to age can be roughly calculated by the following fraction. At one year give $\frac{1}{2}$ the adult dose, and for each year above the first add the number to the top and to the bottom of the fraction so that for two years of age give $\frac{2}{3}$ or $\frac{1}{2}$, for four years of age $\frac{4}{5}$ or $\frac{1}{3}$, and so on up to fifteen years of age. Children, however, take purgatives and belladonna in relatively much larger doses than adults, whilst they are poisoned by doses of opium much smaller than the above fraction indicates.

DOVER'S POWDER contains opium and ipecacuanha and is given in doses of from five to fifteen grains to an adult. Ten grains is the common dose. It is largely used in colds in the head, and in youth for the early stages of colds on the chest, and in many other cases.

DOWSING SYSTEM of treatment is applied to joints that are stiffened by rheumatism, or other cause, and often yields very satisfactory results. The skin over the affected joint is first wrapped in lint rendered fireproof by a previous immersion in a solution of tungstate of soda, and the joint is then enclosed in a box fitted with electric lamps, prepared so as to emit more heat than light when the current is passed. A high temperature, up to 400° F., can be borne for twenty minutes at a time.

DRACHM is one-eighth of a fluid ounce, and is composed of sixty minims or drops. A teaspoonful is about a drachm. The term is also used to denote a weight equal to that of sixty grains.

DRAINAGE TUBES (Surgical), made of indiarubber, silver or bone, are inserted into deep wounds to drain them of pus, and thus promote their healing. Care must be taken to keep the discharging end covered with antiseptic dressing.

DRAINS must be in good order if the house and the town are to be healthy. The chief points in good drains are that they are (1) water tight, (2) well ventilated, (3) without direct connection between those carrying sewage and those carrying waste from baths, washbasins and the like, (4) well flushed. (1) In order to be water-tight the drain pipes should be made of iron, but owing to the expense this involves they are generally made of earthenware. The joints between the earthenware pipes were formerly filled only with clay, but as this was proved to cause leakage in a very short time, they have recently been generally filled with cement, which is much better, but which is apt to expand and produce leaks by bursting the joint; long iron pipes with lead joints is the most water-tight system invented so far. Next the bed in which the pipes are laid must not be liable to sink or the joints will give, even though firmly cemented. For this purpose care is taken not to sink the original trenches deeper than necessary, as any filling in with fresh earth promotes subsequent sagging. At times drains are laid in beds of concrete, though this is not as efficient as at first hoped, owing to cracking often taking place. (2) The ventilation of the drains must be very thorough, or sewer gas will find its way into the house in spite of the most careful traps to prevent it. (3) The waste pipes from baths, etc., should never open directly into the sewer, even though the connection is guarded by a trap. They should pour their water into an open receiver or gully placed outside the house, and the gully should be connected with the sewer. Then if any sewer gas escapes from the gully it will pass off in the open air without being conducted into the house. In the same way the water used to flush the water-closet should not come direct from the chief cistern, but from a special small cistern, the water of which is never used for drinking purposes. By this arrangement if sewer gas pass into the small cistern, it will be absorbed by the water in it without passing on to the chief drinking water cistern. (4) In order that a drain may be well flushed, not only must an ample supply of water pass down it, but the drain must be laid at such an incline that the flow is sufficiently rapid, and must be fairly narrow and as straight as possible for the same reason; and again, friction must be reduced by making the internal surface smooth. By these means the accumulation of filth is reduced to a minimum. *Testing* the drains is best done by plugging the outlet of the suspected drain at the nearest man-hole and then filling it with water from the water-closet. If a leak is present, the water soon sinks, and if many leaks are present it may not be possible to fill the drain at all. Suspected leaks may also be tested by pouring down strong oil of peppermint or asafœtida in hot water, whilst a second person in the room below determines whether the odour escapes or not, but this method is not so thorough as the former test, though more easily performed by the householder. [Refer to *Typhoid Fever, Diphtheria, Water Closets*—Sewage Disposal.]

DREAMING is mental action during sleep. It is only present in the lighter forms of sleep, which form intermediate steps between the sleeping and the waking states. The chief characteristic of mental action of this kind is the absolute faith possessed at the moment, the sense of probability being in abeyance, whilst the imagination seems remarkably active, so that every mental picture is, to the dreamer, reality. Dreaming is induced by all causes that disturb sleep; the chief of which are unsuitable food before retiring to rest, unsuitable bed-clothing, an impure blood-supply to the brain due to heart disease, excessive use of tobacco, kidney disease or constipation, or it may be mental strain arising from anxiety or study pursued till bed-time. The treatment is the removal of the cause. Night-mare is common in nervous children, and is generally due to indigestion and to mental causes combined; school work, ghost stories, a visit to the Zoological gardens or to the pantomime will on enquiry be often found to be the immediate cause of an attack. A dose of castor oil, fresh air and mental rest, is the treatment that should be adopted.

DRESSINGS for wounds should be clean and simple. The dressing is not intended to heal the wound but to keep out the dirt and to prevent friction which would delay the healing process. For *cuts* dry dressing is the best, made of a piece of clean linen or lint, the smooth side of which goes next the wound; this should be covered with a layer of cotton wool secured with a bandage. Dry gauze soaked in collodion and applied in several layers one at a time is also a good dressing for clean cuts. Friar's balsam and lint is also used. If a *cut festers*, fomentations are required, which are made by wringing out lint or linen rag in boiling water containing as much boric acid as it will dissolve. The wringing should be done thoroughly by placing the lint in a clean towel, and if possible two people should wring, one at each end of the towel. The lint is then covered by oiled silk cut larger than the lint, and this in turn is covered by wool and secured with a bandage. The fomentations should be applied every three hours. For burnt surfaces and *ulcers* ointment spread on lint is usually the best dressing. In such cases the patch of ointment should be no larger than the wound. The best ointment is boracic, vaseline, or eucalyptus ointment, and when a more stimulating ointment is needed, as in dealing with chronic ulcers, yellow oxide of mercury, seven grains to the ounce of vaseline, is useful.

DRINK. See *Cookery, Alcoholism.*

DRIPPING is an excellent substitute for butter, best given on hot toast with salt. Beef dripping is the best. It must be borne in mind that dripping dissolves the glaze of newly glazed earthenware vessels, and can thus cause lead poisoning. It also absorbs copper from copper vessels and produces copper poisoning.

DROPPED WRIST. See *Lead Poisoning* in *Dangerous Trades.*

DROPSY is the accumulation of lymph at any one part of the body. When the abdomen presents dropsy, the term "ascites" is used, but when the dropsy is beneath the skin the term "anasarca" is used. The *causes* of dropsy are either obstruction to the circulation or certain changes in the quality of the blood, the latter being produced most often by Bright's disease or anæmia. When due to mechanical obstruction, the heart or the liver is usually at fault, and the dropsy in these cases appears first in the abdomen and the legs. When due to impurity of the blood, puffiness of the face on waking is the commonest form for the dropsy to take. It will be thus seen that dropsy is a symptom and not a disease in itself. The *treatment* varies with the cause, and should be in medical hands. The indiscriminate use of gin as a cure for dropsy can only be strongly condemned. Care should be taken to keep the legs and feet, if dropsical, well clothed in loose stockings, garters should be avoided, and all chafing prevented.

DROWNING. See *First Aid.*

DRUGS may be classified according to their effects on the different organs of the body, though many drugs, which act on more than one organ, have to be mentioned more than once.

1. BLOOD. To increase the formation of blood :—	To remove impurities from blood :—	To arrest bleeding :— (Hæmostatics).
Arsenic	Potassium iodide	Adrenalin
Iron	Aperients	Ergot
	Diuretics	Astringents

2. HEART. Stimulants :—	Depressants :— (which weaken the heart).	To relieve pain in the heart :—
Digitalis		Amyl nitrite
Strophanthus	Over doses of the	Ether
Squill	stimulants	Atropine
Convallaria	Antimony	
Caffeine	Aconite	
Ammonia	Apomorphine	
Alcohol	Chloral	
Ether	Hemlock	
Strychnine	Emetics	
Amyl nitrite		

3. LUNGS. To loosen cough :— (Liquefying expectorants).	To strengthen cough :—(Stimulating expectorants).	To suppress cough :—
Ipecacuanha	Ammonia	Opium
Salts of potash and soda, the sulphates excepted	Squills	Codeine
	Ether	Heroin
	Senega	Acids

To deodorise the phlegm :—	To strengthen respiration :—	To relax spasm in asthma, etc. :—
Eucalyptus	Ammonia	Belladonna
Creosote	Strychnine	Stramonium
Balsam of Tolu	Ether	Opium
Benzoin	Atropine	Nitre

4. STOMACH. To relieve Acidity :—	To aid Digestion :—		To counteract Flatulence :—	
(After food)	(Before food)	(After food)	(By dispersing)	(By preventing)
Bicarbonate of soda	Bitters	Pepsin	Peppermint	Creosote
Bismuth	Alkalies	Hydrochloric acid	Ginger	Carbolic
Magnesia	Hot water		Asafœtida, etc.	β Naphthol
Ammonia				

To relieve pain :—	To cause vomiting :— (Emetics).	To stop vomiting :—
Bismuth	Mustard	Bismuth
Alkalies	Warm water	Weak alkalies
Prussic acid	Salt	Soda water
Morphine	Alum	Cocaine
	White vitriol	Prussic acid
	Carbonate of ammonia	Chloral
	Tartar emetic	Bromide
	Ipecacuanha	
	Apomorphine	

5. LIVER. To increase the bile :— (Cholagogues).	To expel more bile in the motions :— (Cholagogues).	Drugs bad for the liver :—
Podophyllin	Mercury	Opium
Euonymus	Calomel	Lead
Aloes		
Jalap		
Nitro hydrochloric acid		
Colocynth		
Iridin		
Salts of soda		

6. KIDNEYS. To increase the urine :— (Diuretics).	Drugs that diminish the urine :—	To disinfect the urine :—
Alkalies, except ammonia	Opium	Benzoic acid
Water	Fairly large doses of alcohol, turpentine and cantharides	Sandal wood
Juniper		Urotropin
Caffeine		Copaiba
Alcohol		Cubebs
Broom		
Buchu		

To make urine more acid :—	To make urine less acid :—	To relieve spasm :—
Benzoic acid	Alkalies, except ammonia	Hyoscyamus
Salicylic acid		Opium

7. SKIN. To cause sweating :— (Diaphoretics).	To check sweating :—	To lower the temperature :— (Antipyretics).
Jaborandi	Belladonna	Antefebrin
Opium	Picrotoxin	Antipyrin
Many diuretics	Zinc oxide	Quinine
		Antimony
		Aconite
		Alcohol

8. NERVOUS SYSTEM. Stimulants :—	Depressants :—	Depressants that are useful as sleeping draughts :— (Hypnotics).
Strychnine	Stimulants in larger doses	Bromide
Ammonia	Chloral	Chloral
Valerian	Bromide	Chloralamide
Opium	Prussic Acid	Veronal
Indian Hemp	Sulphonal	Opium
Alcohol	Trional	Trional
Ether	Carbolic Acid	Sulphonal
Chloroform		Paraldehyde
Cocaine		Hyoscine
Belladonna		

9. EYES. To dilate the pupil :—	To constrict the pupil :—	10. EARS. Drugs that cause deafness :—
Belladonna	Physostigmine	Quinine
Atropine	Eserine	Salicylic acid
Cocaine	Opium	

[For drugs acting on the intestines refer to *Constipation*, *Diarrhœa* and *Worms*. See also *Anæsthetics*, *Counter-irritants*, *Disinfectants*.] It will be noted from the above table how many different uses certain drugs can be put to: for instance, opium. It is also noteworthy that many drugs in large doses have an action just the opposite to that which they exert in small doses. Drugs having similar actions are commonly given combined in a mixture. Drugs are also combined to neutralise the bad effects of one of them, whilst its useful effect is left unchanged. Thus opium and belladonna are often given together, for opium will then relieve pain, whilst its depressing action on the heart and respiration, its tendency to constipate and to produce sweating, are counter-balanced by the belladonna. Drugs which mutually decompose each other by their chemical action are termed "incompatibles," e.g., chalk and an acid, and these combinations are carefully avoided in writing a prescription. The rapidity with which a drug acts after being swallowed varies greatly with its solubility, and this fact is always taken into account. When immediate action is required, the drug must be injected in soluble form under the skin. The dose has to be adapted to the age of the patient [See *Dose*]. It has also to be adapted to the particular individual, as tolerance to different drugs varies widely in different people, and also varies with the previous amount taken; thus, the amount of opium or arsenic that can be taken by those addicted to their use would be fatal to a healthy man.

DRUM. See *Ear.*

DUCT is a tube that acts as a canal for the passage of a fluid. Thus the bile duct, and lachrymal duct, convey bile and tears respectively.

DUMBNESS is almost always due to deafness, which dates either from birth or began before speech was acquired. Speaking and lip-reading are now taught with much success in institutions devoted to the purpose.

DUST is a potent cause of disease. All the dusty trades have a high death rate, especially from consumption and other diseases of the lungs. Street dust is composed largely of dried horse-dung, and this settling on milk is one of the chief causes of the epidemic diarrhœa, so fatal to infants every summer. In the workshops the dust is largely determined by the nature of the trade, and the more gritty the nature of the dust the worse, hence knife-grinding and stone-dressing are particularly deadly. In the country the pollen of the grasses every spring forms a considerable fraction of the total dust, and it is the irritation of this pollen which is the cause of hay-fever. It is to be noted that the nose is the natural filter for stopping dust, and breathing through the mouth is thus unhealthy. But even when breathing through the nose is habitual, the lungs of the town-dweller receive sufficient smoke and other forms of dust to change them from pink to blackish grey in the course of a lifetime. The microscope shows this discolouration to be due solely to particles of dust deposited in the lung substance. It is much to be desired that each house should consume its own smoke, and that the motor car should be the means of reducing the amount of horse-dung on our streets, in the near future.

DUSTING POWDERS are best made of starch, combined with some other body, such as boric acid or zinc oxide. Starch 20, boric acid 3, zinc oxide 2 parts in 25 of dusting powder, is an excellent preparation. Fuller's earth is also used. Dusting Powders are used to secure thorough dryness of the skin, and are valuable in caring for the delicate skin of babies, and for placing inside the socks and between the toes in those who are liable to blistered feet or to corns. [Refer to *Infants.*]

DYSENTERY is the name of a group of diseases, not yet fully understood, which present inflammation and ulceration of the large bowel with diarrhœa; and in which blood and slime are passed frequently and much painful straining is induced. The disease is most common in the Tropics, but a form of dysentery, known as "Asylum dysentery," occurs in Europe from time to time, when over-crowding and other forms of bad hygiene exist in institutions. Tropical dysentery is apt to be followed by tropical abscess of the liver. The treatment formerly adopted was the free use of ipecacuanha, but recently repeated doses of Epsom salts have been given, and it is said with benefit, but the whole subject is still *sub judice*. Some forms of dysentery are due to an amœba or animal parasite, but other forms are due to a bacillus or germ. Against the latter form of dysentery the Jenner Institute has recently obtained an anti-toxin.

DYSPEPSIA. See *Indigestion.*

EAR is divided into three portions, the external ear or visible portion, the middle ear or drum, and the internal ear or labyrinth. Fish have the internal ear only, but that they hear is clear from the possibility to teach carp to come and be fed when a bell is rung. Birds and reptiles have the middle and internal ear. What in them and in mammals is the middle ear corresponds to the first gill cleft in fish. As they do not breathe by gills, the gill-clefts, which all appear in the embryo, close again with the exception of the first one, which becomes the middle ear and is thus adapted to a different function. Mammals have the external ear in addition, the purpose of which is to collect sound and focus it on the drum. It will be noted that in aquatic mammals e.g., seal, whale, etc., the external ear is small or absent, whilst in many mammals, especially those much liable to the attack of carnivora, the ears are very large and movable (cf., of rabbit, deer), and that in man the ear is intermediate in size between these limits and can be moved but little, if at all, though three rudimentary ear-muscles still exist. The value of a large external ear as an aid to hearing is turned to account in deafness by the use of the ear trumpet. The ear-hole leads into the outer passage or external auditory meatus, a tube composed of gristle in the outer part and bone in the inner portion. The passage is lined by hairs and wax. The latter is secreted from special glands which replace the sweat glands of the skin. The purpose served by hair and wax in this case is the same as when they are found in plants, namely, protection against the entrance of insects and moisture. The wax gradually passes out of the ear, and it should not be forcibly removed by instruments, as this is not safe. The end of the outer passage is blocked by the membrane of the drum or tympanic membrane. The middle ear or drum is a cavity in the bony wall of the skull, shut off from the exterior by the membrane of the drum, but communicating with the external air by means of a passage that opens into the back of the nose, known as the Eustachian tube. So long as the Eustachian tube is open, the atmospheric pressure on the outside of the drum membrane will equal that on the inside, and unless this equality is maintained the membrane is sucked in or forced out and deafness is caused. Extending across the drum from the membrane on the outer side to the internal ear on the inner side is a chain of small bones. Vibration, set up in the air by ringing a bell or by other source of sound, is thus conveyed to the external ear and focussed on the drum membrane, which is thrown into vibration; the membrane sets in vibration the chain of small bones, which in turn stimulate the internal ear from which impulses are carried by the auditory nerve to that part of the brain concerned with hearing. By this series of steps the ringing of the bell is heard. When the passage is blocked, the drum membrane disabled, or the chain of bones damaged, hearing can still occur by conduction of the vibration by the bones of the skull to the internal ear. Such a mode of conduction is the only one possible in fish, but in man it is a poor substitute for the normal mechanism, unless the source of sound be in actual contact with the skull. However, by holding a sound collector of some kind between the teeth, sufficient vibration may be collected to produce hearing, and fan-shaped and other instruments are made for this purpose. The internal ear, besides being an organ of hearing, also contains the three semicircular canals, the function of which is to give information about the position of the body. Hence disease of the internal ear causes giddiness as well as deafness, a condition known as "Menière's disease."

EAR-ACHE may be due to a wisdom tooth [See *Teeth*], or to inflammation of the middle or outer ear. If examination

of the teeth shows nothing wrong, warm olive oil containing an eighth part of laudanum may be dropped into the ear or poured in from a teaspoon, and a fomentation applied directly afterwards every four hours. If relief is not soon obtained, or if though the pain ceases ear discharge begins, medical aid is necessary. Chronic discharge from the ears always requires medical attention. If from one ear only, it may be due to a foreign body in the ear that has been neglected. A foreign body in the ear should receive immediate attention. Should a bead or other such body be introduced, the head should be turned on one side with the affected ear downwards and a smart tap given to the head on the opposite side. This treatment may shake it out but will probably fail. Syringing should be tried next, directions for which will be found under "deafness," and if this fails nothing more must be done till the doctor comes, as any attempt to remove it by a hair pin or other instrument will almost certainly drive it in against the drum and do much harm. When a seed like a pea has been introduced, syringing must not be attempted till the doctor comes, because it makes the pea swell and great pain is thus caused if the pea is not dislodged. When a cockroach or other insect has entered the ear it cannot of course go further in than the membrane of the drum, but by kicking against this great pain is caused. As insects breathe air they are readily drowned, and the ear therefore should be filled with warm olive oil and laudanum, and wool placed in the outlet. An hour later syringing should be practised to wash the dead insect out, and if this fails a doctor is required. Ringing in the ears may be due to some medicine which is acting on the auditory nerve, e.g., quinine and salicylates. If no medicine is being taken a doctor should be consulted. In lunatics ringing in the ears is often interpreted wrongly and changed in their minds to the voices of some familiar friend or enemy, or to that of some good or evil spirit. [Refer to *Deafness.*]

EARTH-CLOSETS. See *Sewage.*

ECZEMA is an inflammation of the skin accompanied by the discharge of a serous fluid that stiffens linen, and by itching. The term is popularly used for any inflammation of the skin. The causes of eczema probably vary in different cases, for as many as eighty different germs have been isolated from the skin in cases of eczema, and it has not been determined which of them is the actual cause. Amongst the causes that promote the occurrence of eczema are (1) irritants applied to the skin, e.g., friction, heat, dried sweat, and carbolic, washing soda, soap and other chemicals; (2) poisons present in the blood supplied to the skin such as occur in the subjects of gout, indigestion or nervous exhaustion; (3) deficient circulation in the skin due to varicose veins, garters, etc. The *treatment* is the removal of the cause and the application to the affected skin of remedies which vary with the stage the eczema is in. The problem is too involved to be dealt with by any one but the doctor. The patient need have no fear that curing the eczema will injure his health. There is a prevalent myth that a weeping eczema is a safety valve by which impurities are discharged from the system. This idea, though very consoling to both doctor and patient when a chronic eczema defies all treatment, is none the less without foundation in fact. Another point we would emphasise is that the eczematous skin should be washed in bran or barley water and never in soap and water. [Refer to *Baths.*]

EDUCATION in relation to health. See *Childhood.*

EFFERVESCENCE is the bubbling of a liquid owing to the rapid evolution of a gas within it. The usual way of obtaining effervescing medicine is to have two powders or solutions, one of which contains citric or tartaric acid, and the other bicarbonate of potash or soda. A still better acid to use is fresh lemon juice. On mixing the two, carbonic acid is formed and causes the effervescence. Effervescing drinks are refreshing chiefly because they clean up the tongue and throat so well; the carbonic acid is also sedative to the stomach, and after absorption into the circulation the tartrate or citrate of soda or potash, which is formed, promotes the action of the skin and kidneys. If the dose of tartrate of soda be sufficient it is also purgative, as in the familiar Seidlitz powder. Insoluble powders may be taken in suspension in effervescing mixtures; thus quinine, which is only soluble in a strongly acid medium, and magnesia and caffeine are often taken in this way. In mixing the bicarbonate with the acid, the former should be in slight excess, twenty grains of the former to fifteen of the latter is a suitable dose.

EFFUSION is the pouring out of fluid into any part of the body from some morbid cause; for example, pleuritic effusion, and water on the knee.

EGGS. Like milk, eggs contain all the food that the young animal requires to live on, and as they are also very digestible when properly served, they form an important food for the sick. They are most digestible when beaten up raw and least digestible when boiled hard. Hard boiled eggs are too indigestible for invalid purposes. The fresh hen's egg is the most suitable. They may be served as custard, plain boiled, scrambled, poached or fried. The yolks of eggs are used to form an emulsion with castor oil and other oils that have to be administered. The raw whites of eggs beaten up in water is a useful food in diarrhœa. [Refer to *Custard, Albumen water.*]

ELBOW-JOINT is a hinge joint, that is, one that permits motion in one direction only. Dislocation and fractures in its immediate neighbourhood are both common and often associated, so that in cases of injury here examination by the X rays is well worth the extra expense involved.

ELECTRICITY is still in its infancy in relation to physiology and medicine, as indeed probably to most branches of knowledge. Like all powerful agents of which little is known, it serves the purpose of the ignorant impostor in his dealings with the mystery-loving public only too well, but in medicine proper its use as a curative agent is still very limited. When Galvani found that the legs of a decapitated frog could be made to kick by a galvanic current, he hoped he had grasped the secret of life itself; but subsequent research has forced a far more modest view on the scientific world. We now know that living matter reacts to many stimuli, which include injury, heat, light, chemical irritants, and also electricity. Further, we have learnt that chemical activity is always accompanied by electrical activity, and that living matter presents a continuous series of chemical changes, and therefore of electrical changes also. Each beat of the heart, each movement of a muscle or transmission of a nerve impulse, and even the falling of light on a green leaf or on the back of the eye, has been shown to be accompanied by the production of an electric current. The direction of these currents has been determined, and it has been demonstrated that the most active portion of the organ under observation corresponds to the zinc plate of the galvanic cell. The electric currents thus produced are too weak to be felt, and yet only one-tenth part of the current produced is permitted to flow through the apparatus used to detect it, so delicate is the instrument used. The strength of the currents produced during vital activity has not been measured with absolute accuracy, but it is clear that the greater the activity the greater the current; thus fatigue, the action of anæsthetics or the approach of death, are all accompanied by marked diminution in the electric activity of the organ under observation. In the medical practice of to-day all these minute electric changes are ignored; but will this always be so or will they form a valuable guide to the detection and treatment of morbid conditions in the future? At present electricity is used to stimulate organs over which the patient has lost control, and to soothe nerves suffering from neuralgia. In many affections of the nerves or the spinal cord, temporary paralysis of the muscles supplied occurs, and if these muscles are not exercised they waste away. To prevent such wasting the muscles should be thrown into action for ten to twenty minutes daily by electrical stimulation, and they should be massaged also. Such treatment to be effective and safe must be in medical hands, a knowledge of anatomy as well as of electricity being requisite. For neuralgia the passage of a continuous current along the affected nerve for twenty minutes or so is often tried, but the results are not very successful. For hysterical patients and for malingering the sudden application of an electric

shock often works wonders. This is not due to any hidden virtue in the electricity but to the suddenness, novelty and unknown nature of the remedy applied. The writer has seen cases of hysterical paralysis, blindness, dumbness and the like, relieved instantly but such cases have often relapsed by the time they reached home, and although again repeatedly relieved, the tendency has been, when the novelty of the treatment wore off, for its efficacy to diminish greatly. The grave calamity of submitting a genuine case of blindness or other serious condition to the painful ordeal of severe electric shocks, under the impression that the patient is hysterical or shamming, is one that has not infrequently occurred and will again occur so long as the public allow themselves to be taken in by quacks. [For *Animal Magnetism*, See *Hypnotism*. Refer to *Dowsing System* and *X rays*.]

ELEPHANTIASIS is a tropical disease caused by a worm, named the *Filaria nocturna*. The disease is prevalent in parts of Africa and the East Indies. The embryo worm is introduced into the blood by the bite of a mosquito. The embryo passes into the lymphatic system and grows into an adult in that situation, feeding on the lymph with which it is bathed. The female worm normally discharges embryo worms and not eggs. The embryo worms make their way into the blood and are removed by the bite of the mosquito and transferred to another host. It is of interest that the embryoes are only found in the blood at night, and that the species of mosquito—the Anopheles—which spreads the disease only bites by night, which is a good example of the minute adaptation so often to be found in parasites. No great harm results so long as the process is normal. When, however, the adult worm is injured, it discharges its eggs before they are hatched, and these block the lymphatic circulation. The region from which this lymph comes is thus swollen and inflammation often follows. Such a condition frequently repeated results in a permanent enlargement of the affected organ, which may reach truly gigantic proportions. The legs and scrotum are most often attacked. "Elephantiasis Græcorum" is an obsolete name for leprosy.

EMACIATION or loss of flesh to a serious extent is a condition that requires attention. The causes fall into three groups; (1) the food taken is insufficient, as in starvation and in hysterical loss of appetite; (2) the food taken, though sufficient, is not absorbed into the circulation owing to indigestion or to the presence of a tape worm, which absorbs the food itself; (3) the food taken is sufficient for ordinary purposes and is absorbed, but the due nutrition of the body is prevented by poisons in the blood owing to consumption, cancer, matter pent up in a deep organ or some other serious condition. The treatment is the removal of the cause.

EMBOLUS is any body which has got loose in the circulation and been carried into a blood vessel too narrow to allow it to pass; the blood vessel is thus plugged, and the area supplied by it is cut off from the circulation.

EMBROCATION. See *Liniment.*

EMERGENCIES. See *First Aid.*

EMETICS are remedies for the production of vomiting. They include hot water and mustard, salt and water, or copious draughts of tepid water, sulphate of zinc, and tickling the throat with a feather or putting the finger down the throat. These act by irritating the throat or stomach. The second group act after their absorption into the blood by irritation of the vomiting centre in the brain, and therefore take longer to act than the remedies in the first group, though they are less unpleasant. They include ipecacuanha in large doses (20 grains of the root) apomorphine, antimony or tartar emetic. For poisons, the *best emetic* for household purposes is a tablespoonful of mustard in a tumbler of water. For unloading the stomach after an indigestible meal, twenty grains of the powdered root of ipecacuanha or a tablespoonful of ipecacuanha wine will produce vomiting in twenty minutes. [Refer to *Poisons, Croup.*]

EMOLLIENTS are substances which soften the skin, e.g. oil, ointment, or hot fomentations.

EMOTION has a remarkable effect on digestion, circulation, and the secretion of the various body fluids, especially on milk, sweat and saliva. Anxiety often arrests or prevents digestion, intense joy or fear may cause fainting or even a fatal stoppage of the heart. Infants have often been poisoned by the milk from the breast of a mother who has just been enraged. St. Vitus's Dance often dates from a fright.

EMPHYSEMA is a term applied to two conditions, (1) surgical emphysema or bubbles of air under the skin, a condition which often follows tracheotomy, and (2) a dilated state of the air-cells in the lungs. Such a condition is very common in elderly men who are the subjects of chronic bronchitis. The lung substance loses its elasticity, which is the chief agent by which the breath is expelled, hence the subject of emphysema suffers from an accumulation of air within the lungs, which he has great difficulty in getting rid of. The lungs are distended and the chest so changes in shape as to have the maximum capacity, that is it becomes more spherical than normal; the breath is short, and the blood being deficiently aerated, imparts a bluish hue to the lips and ears. The over-distention of the lungs obstructs the circulation through them, which throws more work on the heart; a heart moreover no longer young, and symptoms of circulatory failure usually ensue. The disease is very common in the natives of the mountains and in those exposed to all weathers and irregular habits, e.g., cabdrivers. The *treatment* is to avoid the causes of chronic bronchitis and to live a temperate, even life. [Refer to *Bronchitis.*]

EMPYEMA is matter in the pleural cavity. [See *Pleurisy.*]

EMULSION is a mixture in which oil is suspended evenly throughout in the form of microscopic drops. Milk is the natural emulsion. In such a form the oily feeling in the mouth is abolished and the digestibility much increased as the digestive fluids can act on each drop separately. Oil is emulsified by yolk of egg, soap, gum and other bodies. Cod-liver oil is commonly administered as an emulsion.

ENAMEL. See *Teeth.*

ENEMA or clyster is an injection into the lower bowel. Such an injection cannot pass further than the junction of the large and small intestine because the ileo-cæcal valve prevents this. The purpose for which enemata are given varies. They may be classified thus:—

Purpose.	Composition.	Mode of Administration.
1. To open the bowels.	(a) Yellow soap and one pint of water.	Injected at blood-heat with a Higginson's syringe or douche-can.
	(b) Glycerine, two teaspoonfuls.	Injected cold with a small glass syringe.
	(c) Gruel or barley water, starch mucilage or olive oil one pint.	As in 1 (a).
2. To lock up the bowels.	Laudanum one teaspoonful in starch mucilage, four or five tablespoonfuls.	Injected at blood-heat with a glass syringe.
3. To expel wind.	Oil of turpentine two tablespoonfuls in gruel or starch mucilage, half a pint.	As in 1 (a).
4. To quench thirst when water is not allowed by the mouth. To be given twice daily.	Water one pint, table salt one teaspoonful.	As in 1 (a).

Purpose.	Composition.	Mode of Administration.
5. To feed the patient when food is not given by the mouth. (These are nutrient enemata usually given every four hours).	Peptonized milk or beef-tea eight tablespoonfuls, or beef-tea and peptonized milk, of each four tablespoonfuls. The above to be thickened by the addition of the yolk of an egg. Beef-tea eight tablespoonfuls and somatose one half teaspoonful dissolved in it is another recipe. A teaspoonful of grape sugar and of brandy is often added also.	The bowel is first washed out and the nutrient then allowed to run in slowly from a glass syringe, to which a piece of soft india-rubber tubing is attached. The tubing should be lubricated at the tip with vaseline, not glycerine. The fluid should run in by its own weight; the piston of the syringe should be removed. The temperature is blood-heat.
6. To stimulate a patient who is too unconscious to swallow.	Brandy two tablespoonfuls, in coffee six tablespoonfuls.	Allowed to run in at blood-heat as in 5.
7. To kill thread worms.	Infusion of quassia chips, or a strong solution of salt in water. For a child half a pint.	As in 1 (a).

To *administer an enema.* The enema is first prepared and the temperature taken with a bath thermometer. The enema is injected at 99° F., and therefore should be about 105° in the jug to allow for cooling, the smaller the bulk of fluid the more important this is. The bed is prepared by placing a mackintosh and clean towel beneath the buttocks of the patient. The patient is placed on the left side and the buttocks brought to the edge of the bed. Stimulants should be handy as occasionally the patient faints, though this is very rare. The syringe is then filled till all air is excluded, as it is important not to inject air. In the case of the Higginson's syringe this is best done by placing both ends in the fluid and squeezing the ball until no more bubbles appear. The nozzle is then softened in hot water, lubricated with vaseline, and gently inserted. The fluid to be injected is generally put into a bowl and either the right amount only put in or the number of squeezes of the ball of the syringe counted. Each squeeze may be considered to inject two tablespoonfuls, and a pint contains forty tablespoonfuls. A douche can, raised two feet from the bed, may be used instead of a Higginson, and for self-administration is better. If an enema is to be retained it must be given more slowly than when it is not, but in any case there should be a slight pause between each squeeze of the syringe. By pressing the buttocks together with a cloth and by letting the patient lie still with a low pillow or none so that the buttocks are rather above the level of the head, enemata can often be retained which are otherwise rejected.

With regard to the preparation of the enemata themselves directions for peptonising milk are given under *milk*, whilst to make starch mucilage the following directions may be useful:—Work up two teaspoonfuls of starch into paste with a little cold water and then add half a pint of boiling water and stir. Next, to judge the quantity of an aperient enema suitable for different ages, a rough guide is to allow two tablespoonfuls for each year of life up to twenty years. Nutrient enemata should, however, not exceed eight tablespoonfuls, or rejection generally follows. *Suppositories* are made of gelatine or cacao butter, which melts at blood heat, and they contain nutrient material or drugs. Their use is not recommended, as they are apt to cause irritation and to fail to melt.

ENTERIC FEVER. See *Typhoid Fever.*

ENTERITIS. See *Diarrhœa.*

EPIDEMIC DISEASES are such as attack a large proportion of the population at about the same time. Such diseases are generally due to a germ. The causes at work to render so many people susceptible, who at other times are not so, are various. Climatic conditions are the chief of these causes, as is shown by most of the common fevers being prevalent at a particular time of year. Though whether the changes of the season exalt the virulence of the germ or depress the resistance of the population is not yet determined. The effect of season on epidemics is well shown in scarlet fever, the prevalence of which steadily rises from October to the end of December and then suddenly diminishes, although the climatic conditions of the end of December and the beginning of January cannot be said to be strikingly different. Again, the closely allied German measles is dormant all the autumn whilst scarlet fever is common, and fully active from April to the end of June, when scarlet fever is comparatively rare. English measles again is common in the spring and autumn and comparatively rare between whiles. Most epidemics are more common in the tropics than in the colder regions, but scarlet fever is very rare in India and never reaches epidemic form, though on the same latitude in the Western Hemisphere it is generally epidemic. A disease which is epidemic in certain months or in certain years is prevented from dying out by the occurrence between whiles of a few isolated cases here and there. The disease during this time is said to be "endemic." When, on the other hand, the epidemic is so great that practically no one escapes, as in certain outbreaks of influenza, the disease is said to be "pandemic." Epidemics not due to a germ may be due to some poison in the food supply, like the outbreak of arsenical poisoning due to bad beer that occurred in 1901. Again, epidemics of nervous disorder break out from time to time as the result of hysterical mimicry. The classical example of this is the pandemic chorea of the middle ages, when epidemics characterised by great excitement, gesticulation and dancing, broke out several times under the influence of religious fervour. The fainting of nearly fifty young girls in a college chapel, the ventilation of which was no different from that on any other day, is an example of hysterical mimicry that occurred in the experience of the writer. [Refer to *Fevers.*]

EPIGASTRIUM is the central part of the upper portion of the abdomen. [See *Abdomen.*]

EPIGLOTTIS is the lid of gristle that guards the entrance to the larynx or upper end of the wind-pipe. In swallowing the larynx is drawn forwards and upwards and the epiglottis shut down over the glottis or aperture that the larynx presents; food is thus directed backwards into the gullet and is prevented from falling into the wind-pipe.

EPILEPSY is a disorder characterised by fits in which the sufferer is unconscious and may also be convulsed. In *minor epilepsy* or "petit mal," there is a lapse of consciousness for a few minutes, in which unconscious acts may be performed but in which the sufferer does not usually fall. In *major epilepsy* or "grand mal," the unconsciousness is accompanied by convulsions and by falling, hence the name, falling-sickness. *Jacksonian Epilepsy* is a disease in the motor area of the brain which produces convulsions without loss of consciousness, and is distinct from true epilepsy in which no disease of the brain can be detected after death with any of our present methods of examination. The *causes* of epilepsy are heredity, chronic alcoholism in the parents, syphilis, alcohol, or blows on the head. The age of onset is usually under fifteen, but may be delayed to sixty.

The *symptoms* of a fit differ in the different stages. A fit may be divided into the onset, the rigid stage, the convulsive stage, and the stage of recovery. At the onset there is in many cases a warning sensation, the duration of which is often long enough to enable the patient to lie down, but in other cases the patient is struck down unconscious without the least warning and may fall in the fire or drown in his bath. The nature of the sensation is most frequently giddiness or an unpleasant sensation in the stomach, but noises in the ears, flashes of light and other hallucinations occur, and the

patient may throw up an arm and cry out, or run backwards, or spin round. The rigid stage begins by the patient falling with every muscle strained, hence breathing is impeded and the face turns blue. This stage which lasts only a few seconds passes into the convulsive stage, in which the joints are alternately bent and straightened, and the tongue thrust out and in, whilst the mouth is alternately opened and shut, with the result that the tongue is often bitten. The water and less often the motions also are passed in this stage. The convulsion rarely lasts more than two minutes. When it ceases the stage of recovery begins, in which the return of consciousness occurs gradually and only after some time; not infrequently a second fit follows the first before recovery has occurred, and a series of fits may occur which ultimately endanger life. After the fit, and also instead of a fit, the patient may be seized with temporary insanity, in which he may commit a crime.

The *treatment* during the fit is to prevent the convulsion injuring the patient. There is no fear at this stage of his injuring other people. The clothing should be loosened, the head, arms and legs pressed firmly against the ground, and a cork, tooth brush handle or pebble wrapped in a handkerchief be placed between the teeth to guard the tongue. Between the fits, treatment is directed to the reduction of their frequency. Cure, unfortunately, is practically out of the question. Attention to the bowels, abstinence from alcohol, a quiet life out of doors such as the occupation of gardener affords, is the treatment required. Lack of self-control being a prominent feature in epileptics, the discipline should be strict from an early age, and attendance at a well-disciplined school is desirable, though, of course, competitive examinations are unsuitable. Great care must be taken that the epileptic does not ascend heights, bend over a fire, or otherwise expose himself to a sudden fall in a dangerous place, and he should always have companions round him. The frequency of the fits can generally be reduced by bromide given in sufficient doses under medical supervision, but this treatment often reduces the patient to a drowsy state with defective memory, and produces a skin eruption on the face, so that if the fits occur only once in six months, it is better to have the disease than the remedy. For the imbecility, which often accompanies epilepsy, little can be done except perhaps in institutions devoted to the purpose. Mental power is not always affected, and in certain cases amounts to genius, thus both Julius Cæsar and Napoleon were epileptics.

EPSOM SALTS. See *Constipation.*

ERUCTATIONS are small quantities of stomach contents, either fluid or gaseous, that rise into the mouth. [See *Indigestion.*]

ERYSIPELAS, or "St. Anthony's Fire," is a spreading inflammation of the skin due to a germ, the *streptococcus erysipelatis*. This germ lives outside the body in dirt and gains entrance through a wound or even a mere scratch, if contaminated by dirt. The disease also spreads readily by actual contact with infected clothes or patients. The incubation period is one to four days. The *symptoms* are a sudden rise of temperature to 104° with shivering and often vomiting, and shortly afterwards the redness of the skin is visible. The region attacked is most often around a wound or on the face. The red area is remarkable for its well defined margin and raised edge. Blisters frequently form on it and there is usually sufficient swelling on the face to prevent the eye being opened, and if the throat be attacked, suffocation may occur from the swelling. The temperature remains high four or five days and then falls suddenly. The redness of the skin fades in the course of a week or two and is followed by peeling. If the inflammation spread to the deeper tissues, matter forms. In spite of the shortness of the illness, the effect on the general health is severe and delirium is common. The *treatment* is to isolate the patient and give a purge followed by quinine and iron three times a day. The diet should be light and nourishing and given every two hours by day. For the thirst, water but not milk may be allowed between whiles. Brandy will be required in the severer cases. The inflamed skin should be dusted with flour or boric acid powder and be covered with cotton wool. If matter forms, prompt surgical treatment is required. The case should be in medical hands from the onset if possible.

ERYTHEMA is any abnormal redness of the skin which disappears on pressure. It is due to dilatation of the capillary blood-vessels from one of many causes, e.g., irritation by heat, cold, light, chemical irritants, blows, and the presence in the blood that supplies the skin of some poison such as that of scarlet fever, rheumatic fever, etc. Sunburn and scarlet fever have been confused at times. [See *Scarlet Fever, Sun Burn.*]

ETHER. See *Anæsthetics.*

ETHYL CHLORIDE is a colourless liquid which evaporates so rapidly when sprayed on the skin that it freezes it. It has been used to numb the skin before minor surgical operations for a long time. Recently it has been administered like chloroform to produce general anæsthesia with very good results. Consciousness is lost very rapidly, without any preliminary struggling, and the after effects are so soon over that the patient can walk home a short time after taking it.

EUCALYPTUS OIL is useful for inhalation in catarrh of the nose or bronchi. It is mildly antiseptic, and as an ointment is largely used in treating burns. It has been widely recommended as a "cure" for scarlet fever and for influenza, but experience has shown this to be false.

EUSTACHIAN TUBE. See *Deafness, Ear.*

EXCRETION is the process of separation from the blood and the expulsion of waste products from the body. In *secretion*, on the other hand, the substance formed is used up within the body. The chief excretions are urine, sweat, and carbon dioxide, which are discharged by the kidney, skin, and lungs respectively. The excretions also include the colouring matter of the bile, which is formed from worn-out blood corpuscles and is discharged in the motions and also in the urine. Deficient excretion is a serious matter. Death results within ten days if urine cannot escape from either kidney; and bad health ending in gout, skin eruptions and defective mental power results from chronic defects in excretion. The skin and bowels should be kept active if the maximum health is to be maintained. Excretion is promoted by diaphoretics, diuretics and purgatives. If the skin is active, the kidneys usually excrete less, and *vice versa*, whilst by promoting watery motions from the bowel some excretion can be obtained so as to relieve if necessary the work thrown on skin and kidneys. The term "excreta" is popularly used to include the fæces. The normal fæces, however, are not a waste product discharged from the blood, but are merely those portions of the food which have not been absorbed. They are coloured, however, by bile pigment, which is the only portion of the fæces that is a true excretion.

EXERCISE is essential to the full vigour of mind and body. It promotes the circulation, stimulates digestion, ensures healthy sleep, and by making the skin active relieves the kidneys from overwork. Exercise of the mind and body together in the open air is the best form obtainable; that is to say, horse-exercise, foot-ball, and the like are better than dancing, and dancing better than dumb-bells and Indian clubs. Exercise as far as possible should be taken daily; too often in business life no exercise for five or six days alternates with a football match or long cycle ride, whereas a walk or cycle ride should form part of each day's work, either in going to or coming from the office, whilst the gymnasium, swimming bath and riding school should be borne in mind of an evening. In childhood, exercise should be of short duration and frequently repeated. In later boyhood, training for sports must be watched with care, as rapid growth often makes great calls on the strength at this time. In middle age the more active sports and gymnastic feats of youth should give place to those forms of exercise like golf, or country walks, in which there is little call for sudden spurts. This is owing to the fact that the strain thrown on the heart and arteries during any sudden exertion is great, and in middle life the arteries are often older than the muscles and unequal to the strain the latter can cause them. In convalescence exercise should

be resumed gradually, sitting up in bed must precede sitting in a chair, and carriage exercise is often necessary before much walking can be undertaken.

EXHAUSTION demands rest, especially sleep, and not alcohol or other stimulants nor a large meal. At the end of a long day on the mountains it is much better to take a little soup and to turn in early and eat a hearty breakfast next morning than to eat a big dinner, which the stomach is too exhausted to deal with and to awake next morning, if not before, with a bad attack of indigestion.

EXPECTORANTS are remedies which promote the secretion of the air passages and aid its expulsion. Expectorants fall into two groups, (1) those which loosen a cough by liquefying the secretion and (2) those which do not alter the character of the secretion but which stimulate cough. At the onset of bronchitis the secretion is scanty and tenacious, and though the irritable state of the bronchi causes frequent cough, there is really very little material to be expelled. If then, an expectorant belonging to group (2) is given, the painful useless cough will be increased, but if one from group (1) is given the secretion will be liquefied, cough made easy and much relief obtained. Later in the attack of bronchitis the secretion becomes copious, and further increase is undesirable, whilst remedies which stimulate cough and promote expectoration do good. Hence group (2) is used at this stage. Group (1) includes ipecacuanha, spirits of sweet nitre, citrate, and acetate of potash; group (2) includes ammonia, ether, and senega.

EXTRACTS are made by steeping the raw material in water, spirit, ether or other solvent until the active principle has been dissolved out and then in filtering and evaporating down the fluid thus obtained. In some cases the evaporation is continued until a solid residue is obtained, in others a liquid extract of known strength is produced.

EXTRAVASATION is the escape of a fluid from the vessels which naturally contain it into the surrounding tissues. When a blow is given with a blunt instrument, the smaller blood vessels beneath the skin are ruptured, and blood is then extravasated into the surrounding parts, hence the colour of a bruise or black eye. Rupture of the bladder causes extravasation of urine.

EYE is the organ of vision placed in a socket in the skull known as the orbit. Between the orbit and the eye is a padding of fat and certain muscles for the movement of the eye and the raising of the eyelid. The eye communicates with the brain by the optic nerve which passes through an aperture in the bony wall of the orbit behind the eye. The blood supply to the eye consists of the ophthalmic artery and veins. These vessels also pass from within the skull through apertures in the bony wall of the orbit to the eye. The eye consists of a transparent coat in front known as the cornea and of a tough opaque coat behind, the white of the eye or sclerotic. Dividing the eye into an anterior and a posterior chamber and attached just at the junction of the cornea and sclerotic is the crystalline lens, which is a transparent double convex lens, that focusses light on to the back of the eye. Within the sclerotic are two inner coats, known respectively as the choroid and the retina. The choroid contains blood-vessels and is black so that any light that reaches it is not reflected. The retina contains the sensory organs which communicate with the optic nerve. The space between the lens and the cornea, known as the anterior chamber, contains a watery fluid, the aqueous fluid, whilst the space between the lens and the retina is filled with a transparent jelly known as the vitreous, which gives the eye its shape and elastic consistency. In front of the lens is a circular muscular membrane—the iris or coloured part of the eye—presenting in its centre a circular hole—the pupil—which looks black because the interior of the eye is visible through it. To keep the cornea from becoming opaque by dust settling on it, it is continually washed by the tears and by the eyelids, which blink every few seconds and thus polish the cornea. Vision is effected by the following series of steps:—

> Light is focussed in passing through the cornea, the aqueous fluid, the crystalline lens and the vitreous, and finally is thrown on the retina, where it forms an inverted picture of the object from which it came. The retina is stimulated by the light, and its different parts are stimulated differently by the different parts of the picture which is focussed on it. Such differences are transferred, not as light, but as nerve impulses along the optic nerve to that part of the brain which is concerned with vision, and although the picture on the retina is inverted, the mental impression produced is erect.

In focussing light the cornea is the most powerful agent. The use of the lens is to enable objects at different distances to be accurately focussed. Such focussing in the camera is done by altering the distance between the lens and the plate without changing the lens. In the eye the distance between the lens and the plate (retina) is constant and the lens is altered in shape instead. The nearer an object the more convex the lens has to be. Such alteration is effected by a ring of little muscles placed round the edge of the lens, and the process is termed "accommodation." Accommodation for objects nearer to the eye than ten inches is effected with difficulty. The iris or coloured part of the eye regulates the size of the hole in its centre through which light is admitted, and corresponds to the diaphragm of optical instruments. In strong light the iris contracts the pupil and shuts off light and *vice versa* in faint light; and in looking at a near object it also shuts off all light except that near the centre of the pupil, the purpose of which is to produce a more sharply focussed image on the retina. It is thus clear that the eye is an optical instrument very similar in principle to optical instruments of human invention, though infinitely more perfect in its power of rapid adaptation. The health of the eye is often maintained when the general health is much disturbed; there are, however, many abnormal conditions of the eye, the chief of which we will now briefly describe.

Any *foreign body* in the eye is best dealt with by closing both eyes and rubbing the normal one, a flow of tears is thus induced, which often dislodges the foreign body. If this fails, the lower lid should be drawn down, and if the body can be seen, it should be touched with the tip of a clean handkerchief or piece of blotting paper. Eversion of the upper lid, that is turning it up to expose the inner surface, requires practice and is best not attempted. Splinters of iron, grit, etc., embedded in the cornea, should not be touched till a doctor is obtained, but a drop of castor oil should be applied to the inside of the lower eyelid drawn down for the purpose, and the affected eye should be bandaged up to prevent the sufferer doing damage by rubbing it, and in children the hands should be secured also. *Lime* in the eye is best treated by dropping in castor oil or weak vinegar and water. Water alone is bad treatment. *Ulcer* of the cornea is common, due either to injury or to constitutional causes. In healing, ulcers leave an opacity on the cornea, which often takes years to clear up. By perseverance, however, much can be done. Special spectacles are generally required. The treatment from the first must be in medical hands.

The membrane which lines the inner side of the eye-lids and connects them with the eye is the conjunctiva, inflammation of which is *conjunctivitis*. Of this there are many forms, e.g. (1) simple, (2) purulent, and (3) granular. (1) The simple form is set up by many causes, such as a foreign body in the eye, a chill, etc. The symptoms produced are smarting in the eye as though something was in it, pain on looking at the light, discharge which gums the lids together during the night, whilst the eye itself is bloodshot. The treatment is to syringe the eye twice daily with warm boric lotion and to smear the margin of the lids with cold cream, the eyes should be protected from strong light, and in the severer cases small pads of lint or linen soaked in iced water should be applied frequently, whilst all rubbing with the fingers should be carefully avoided. (2) "Purulent ophthalmia," or the ophthalmia of the new-born infant, causes many cases of blindness amongst the poor. In such cases conjunctivitis begins within five days of birth. The symptoms are great swelling of the eyelids, a mattery discharge and burning pain; the cornea may be destroyed by ulceration and blindness result. Until the

doctor's arrival the treatment should be that for simple conjunctivitis, except that the syringing should be hourly and greater care taken to burn all linen soiled by the discharge. (3) Granular Ophthalmia, or conjunctivitis, is the eye-trouble that is so apt to break out in epidemic form in large institutions, especially in such as are crowded with the children of the working-classes. The affection is very chronic. It may be recognised on drawing down the lower lid, when instead of the normal smooth surface a number of little raised bodies the size of a pin's head are seen. These bodies scratch the cornea and produce ulceration and much irritation in it. The discharge from the eyes, like that in gonorrhœal ophthalmia, is highly contagious. The treatment is strict isolation and protection from the light until the doctor's arrival.

Iritis is inflammation of the iris or coloured part of the eye. The chief causes are rheumatism and syphilis. There is pain, dimness of vision, the iris becomes mud-coloured and the eye blood-shot. The affection can thus be readily mistaken for conjunctivitis if the iris itself be not carefully looked at. The treatment is to protect the eyes from the light and send for a doctor. *Optic neuritis* or inflammation of the optic nerve, retinitis or inflammation of the retina and choroiditis or inflammation of choroid also occur and produce blindness, partially or wholly, either for the time or permanently. [*Cataract, Squint, Blindness, Astigmatism* are discussed under their respective heads, and long and short sight under *Sight*.]

EYE-LIDS are folds of skin for protecting the eye. They are lined with a vascular membrane, the conjunctiva, inflammation of which is conjunctivitis [see the last article.] An abscess round the root of an eye-lash is a stye. This is best treated by bathing it with hot water till it bursts and by attention to the general health. The eyelid contains a gland which secretes a lubricating fluid. If the mouth of the gland becomes blocked the secretion which is still produced cannot escape and being pent up forms a cyst or swelling containing fluid, known as a meibomian cyst. A stye is most common in the upper lid and a meibomian cyst in the lower lid. The cyst requires an incision by a surgeon. A wart at the inner corner of the eye may be the beginning of rodent ulcer. [Refer to *Rodent Ulcer, Tears.*]

FACE-ACHE. See *Teeth.*

FACE-BURNING, A symptom of indigestion, which if allowed to continue for some time may give rise to acne rosacea. [See *Indigestion* and *Acne Rosacea.*]

FÆCES are the evacuations from the bowel. [See *Motions.*]

FAINTING is due to a deficient blood supply to the brain usually caused by a temporary weakness of the heart's action. The *causes* are sudden emotion, impure air, want of food, loss of blood, disease of the heart, the early stages of pregnancy and the time of quickening. The symptoms are too well known to need description. The duration of the attack is usually short, but it may last longer and in rare cases end in death. The *treatment* for a faint should be loosening the clothing, giving fresh air, putting the head down and the feet up, and applying smelling salts and wet handkerchiefs or eau de Cologne to the face; stimulants are rarely necessary.

FAITH in a remedy often has a remarkable effect. A hypodermic injection of water will frequently induce sleep if the patient thinks morphia is being given even when the patient is by no means hysterical. Bread pills have also been often known to produce purging. Many other examples are on record. The phenomenon is allied most likely to hypnotism. It is probably one factor in the success of homœopathic remedies in which the doses of the drugs given are infinitesimally small.

FARCY. See *Glanders.*

FASTING in the literal sense of total abstinence from food is rarely wise. Regularity in the time and amount of our meals is always to be aimed at. The occasional exclusion of butcher's meat or other article of diet is no doubt harmless, and positively beneficial to those who habitually over-eat or shirk exercise. On the whole, however, in youth plenty of food and plenty of exercise are much better than little exercise with correspondingly little food. In middle life, when the exercise taken is often reduced, the diet is unfortunately often increased, and it is at this time that partial fasting is likely to be wise. Total fasting, even with a free supply of water, usually proves fatal in twenty days, though the time may be prolonged in certain cases to forty days.

FAT. See *Food.* **FATNESS.** See *Obesity.*

FATIGUE. See *Exercise, Exhaustion, Debility.*

FAVUS or Scaldhead is a disease of the scalp rare in England but common in Scotland and Normandy. Yellow cup-shaped masses form on the scalp and the hair falls out. A mousy odour is usually present. The cause is the Achorion Schonleinii, a fungus. The *treatment* is removal of the crusts with a linseed poultice the surface of which is smeared with olive oil, shaving the scalp or cutting all the hair short and the repeated application of white precipitate and sulphur ointment mixed together in equal parts.

FEAR produces well marked effects on the body as pallor, tremor, sweating and diarrhœa testify. In those with unstable nervous systems a fright may induce St. Vitus' Dance or epilepsy or hysteria. In the management of the nursery and the schoolroom these facts require to be borne in mind.

FEBRICULA denotes a feverish attack of short duration and unknown cause. The patient should be confined to bed on a light diet whilst the temperature is raised, and the case watched to see if further symptoms will develop.

FEBRIFUGE is a remedy for relieving fever. Some febrifuges act by increasing the heat lost by the body, e.g. cold baths; others, known as antipyretics, act by diminishing the amount of heat produced, e.g. quinine and antipyrine. [Refer to *Fever, Fever Drinks,* and *Drugs.*]

FEEDING BOTTLES should be boat-shaped and without india-rubber tubing, as it is essential that they should be kept scrupulously clean. [See *Infants.*]

FEES. See *Doctor.*

FEET, CARE OF. The feet are often troublesome, owing to ill-fitting boots. Corns, bunions, hammer toe, and many other morbid conditions are the result. A boot need not be square toed, but the inner border should be straight. The boot in common use thrusts the big toe towards the centre of the foot, which tends to produce bunion at the root of the big toe, and hammer toe in the one next it. In the same way the pressure to which the other toes are subjected produces a hard corn on the little toe and soft corns between the other toes. The boot should be long enough to enable the toes to lie flat, and the heel should not be so high that the weight is thrown on to the front of the foot. The present fashion of allowing children to wear sandals is doubtless good, but it must be followed up by suitable boots, or by the time middle age is reached, when the increasing weight of the body demands good feet, it will be found, when it is too late, that the feet are hopelessly crippled.

Sweating feet are a frequent source of trouble. In such a case the feet should be washed in soap and water every night and then soaked in a saturated solution of boric acid. In the daytime boric acid should be sprinkled inside the stockings, and a cork sock placed inside the boot. The cork should be cleansed with boric acid solution every few days.

Sore feet may be due to sweating or to stockings that are darned. For a walking tour good stockings are as important as good boots. Sore feet should be treated every night with boric ointment or benzoated lard, to either of which ten grains of salicylic acid to the ounce may be added.

Cold feet require thick stockings and boots that are not tight; the general health should receive attention. Equal parts of camphor liniment and soap liniment may be rubbed into the feet night and morning. If cold feet cause sleeplessness, bed socks should be worn. [Refer to *Blister, Bunion, Chilblain, Corn, Flat Foot, Hammer Toe.*]

FERMENTATION is chemical action induced by the presence of a ferment. The ferment is a body which remains intact and apparently unchanged yet capable of producing chemical action in a suitable medium for an indefinite period, provided the temperature be suitable and the products of the chemical action be removed. The ferments are divided into organised and unorganised ferments. The former are living plants like yeast or certain bacteria, the latter are chemical bodies. The distinction is, however, artificial, as the yeast and other organised ferments only act by producing a chemical or unorganised ferment. The more important varieties of fermentation include the change of sugar into alcohol and carbon dioxide under the influence of the ferment yeast; the formation of vinegar from alcohol under the influence of the bacterium aceti; the formation of lactic acid from milk sugar by the bacterium lactis, a process that occurs whenever milk turns sour either before or after being swallowed. All natural decomposition is the work of ferments, most of them being produced by various kinds of bacteria. The eating of food already decomposing or sour is a common cause of indigestion and diarrhœa, whilst in many forms of indigestion food is fermented during its passage through the stomach and intestines and the gas and acids thus produced cause flatulence, heartburn, and other symptoms. Fermentation is checked by raising or lowering the temperature from that at which the process proceeds most actively and can be prevented by boiling, a fact made use of in making jam. It is also checked by allowing the products of fermentation to accumulate, hence it is that alcohol and vinegar are preservatives. In wine for instance, sufficient sugar to make it taste sweet is only permanent if the percentage of alcohol be sufficiently high, and spirit is added to most of the sweet wines for this purpose. Fermentation is checked by all antiseptics, e.g. carbolic, and the less poisonous of these are used in treating flatulent dyspepsia. They include creosote, β naphthol, sulpho-carbolates and bismuth salicylate.

FERMENTED LIQUORS. See *Alcohol* and *Beer, Wine,* etc.

FETOR. See *Disinfection, Breath Bad.*

FEVER is a term used to describe a group of symptoms of which a rise of the temperature above normal is always one. The other symptoms most often present are a rise of the pulse rate, a rise of the respiration rate, loss of appetite with coated tongue and diminished digestive power, scantiness of the urine which is often also high coloured, languor, headache and delirium.

The cause of fever is the invasion of the body by a germ. This multiplies and produces poisons known as toxins. These toxins are different for different germs. Hence each germ produces minor variations in the symptoms above mentioned. In addition, certain symptoms are also produced which are peculiar to each. Of these the different varieties of rash are a good example. By means of the symptoms peculiar to each germ, we are able to recognise the different species of fever. These species always breed true; a case of small pox gives rise to other cases of small pox but never to measles or chicken pox. At the present day so far as is known they never arise *de novo*, but always from a pre-existing case of the disease, although the connection may be difficult to trace. This is due to the fact that infection can be carried in the case of most fevers by clothing, air, water or milk. By infection we mean the germs in an active state. If these have the power of living outside the body infection can be carried to a great distance; if not then actual contact of the healthy with the sick is necessary to spread the disease. In the former case the fever used to be called infectious, in the latter case contagious, but this distinction is dying out.

Germs do not cause symptoms directly the body is attacked, because it is the toxins, not the germs themselves, which produce the symptoms. To form a sufficient dose of toxin takes time. This time during which the disease develops before the onset of symptoms is the *incubation period.* The length of this period varies within certain limits for each fever. Exposure to infection thus leaves it uncertain whether the fever has been caught or not, until the longest possible time for incubation has elapsed. A day or two over this time is commonly taken as the quarantine period. The *quarantine period* is the time during which one exposed to infection must be isolated before he can be said to be free of all risk of having the disease. For convenience of reference we append a table of these times.

Disease.	Age most likely to catch it.	Incubation Period.	Quarantine Period.
Chicken-Pox	Childhood	12-19 days	20 days
Diphtheria	2–15 years	1–7 days, usually 2	8 ,,
Influenza	All ages	2–6 days	7 ,,
Measles	Childhood	10–14 days	16 ,,
German Measles	Youth	11–18 days	21 ,,
Mumps	Childhood	14–23 days	24 ,,
Small Pox	All ages	12 days	16 ,,
Scarlet Fever	5–10 years	1–7 days, usually 3	10 ,,
Typhoid or Enteric Fever	Young Adults	5–21 days	—
Whooping Cough	Childhood	5–18 days	21 ,,

The chief advances made in our knowledge of fever during recent times consist in the discovery of (1) the actual germs which cause them, (2) the way to treat them, (3) the part played by insects in the spread of infection.

With regard to (1) we must admit much remains to be done. As to (2), we have learnt to feed fevers instead of starving them. Formerly the patient was starved, bled, and purged with the object of leaving the fever no food to feed on. Now the patient's strength is supported as far as possible, to enable him to produce the natural antidotes to the poisons formed by the germs attacking him. Moreover we have obtained for one fever at least, diphtheria, an antitoxin that has considerably reduced the percentage of fatal cases. (See *Antitoxin.*) As to (3) we would mention the relation of the mosquito to the spread of malaria and of elephantiasis, the part played by flies in spreading enteric fever in the South African War, and the tsetse fly in producing the "sleeping sickness."

The *prevention* of fever still remains one of the great problems of the day. We have two courses open: either to render the germ extinct, or to so alter the constitution of those exposed to attack that the germ is harmless to them. Whether to adopt the former or the latter method, or a combination of the two, depends on the fever with which we have to deal. We attempt to banish the germ (1) by the isolation of infected cases, (2) by the disinfection of infected houses and clothing. In certain cases isolation may serve the purpose; thus rabies has been stamped out in England by muzzling all dogs for two years and quarantining all imported ones. In other cases isolation comes too late to be effective; in whooping-cough, for instance, a case is infectious a fortnight before it can be recognised and isolated. In such cases our only chance of success is to so alter the constitution of those exposed that the germ becomes innocuous.

This can be attempted in two ways: (1) by sparing no effort to improve the general health; (2) by inducing a mild or modified form of the fever. The adult of to-day in robust health is infected with great difficulty by most germs. On the other hand, the less healthy individual, be his resistance lowered by drink, poverty, overwork or what not, is infected far more readily. If then we can secure for the masses temperance, sanitary dwellings, wise factory regulations and a knowledge of the laws of health, we shall go far to stamp out many of the fevers. Already in England plague, cholera, and typhus have gone: typhoid is going. Phthisis still stands out defiant. To attempt to annihilate this by isolation in Sanatoria of the infected cases, and by the disinfection of infected houses is futile. Hundreds of cases will escape detection until the later stages, and these must always keep the infection amongst us. It must be attacked chiefly by sanitary dwellings, with more space and air, by more wholesome food and less "drink."

There are certain fevers, however, which the healthiest

at the present day cannot resist if they are exposed to infection. *Influenza* and *Small Pox* are two such fevers. Against the former we have no means of protection; against the latter we have in vaccination an effective weapon. We want inoculations, corresponding to vaccination, in the case of certain other fevers. Inoculation against typhoid was a failure in the late war, but improved methods may yet succeed. Inoculation against cholera and snake-bite are both practised in India. For protection against influenza this method can never be useful because an attack of influenza provides immunity for so brief a time. It can only be useful in such diseases as small pox or typhoid, in which one attack is rarely followed by a second, even in the course of a long life with frequent exposure to infection. [Refer to *Disinfection*, *Sick Room*, and the *individual fevers*.]

FEVER DRINKS. Suitable drinks are described under the following heads:—Aerated Waters, Apple Water, Black Currant Water, Claret, Imperial Drink, Lemonade, Tamarind Water and Toast Water.

FILTERS in domestic use are not so useful as the public think and are often actually causes of disease. Many of those in use do not stop the passage of germs although they may stop the eggs of intestinal worms. Many stop some of the germs, which then flourish in the substance of the filter and infect all subsequent water that passes through. Hence purification of the water by boiling, although more expensive, is a much safer method. Among the more reliable filters are the Pasteur-Chamberland and the Berkefeld. In the Pasteur-Chamberland filter the water passes through a thick walled unglazed earthenware tube, which stops germs. It has been recommended to clean this by brushing the outside with a stiff brush; as, however, the germs are not only outside but probably also distributed through the substance of the porcelain, to be thoroughly cleansed it should be boiled or a new tube substituted.

FINGERS, DEAD. See *Raynaud's Disease*.

FIRST AID. Under this heading we propose to give a few directions for the management of the commoner emergencies. In this subject a few practical lessons are worth much theory, but a few words for purposes of reference may nevertheless be of service. The subjects to which we shall refer are:—Ambulances, bandaging, removal of clothing from injured limbs, fractures, dislocations, sprains, fits, drowning, suffocation, and bleeding. Burns, poisons, sunstroke and injuries to the eye or ear will be found under their respective heads.

AMBULANCES have often to be obtained or improvised for the removal of the injured. In the large towns the police undertake this duty in the case of accidents, and the Metropolitan Asylums Board supply ambulances both within and without the metropolitan area for the removal of fever cases at a moderate charge. Hand ambulances may also be obtained from the St. John's Ambulance Association, St. John's Gate, Clerkenwell. Occasions, however, must often arise when an ambulance has to be constructed on the spot. A hurdle or shutter can be used as a stretcher and a coster's barrow is also convenient. Two poles and two coats may be used as a stretcher by turning the sleeves of the coats inside out and running a pole through the two sleeves on one side when the two coats are placed with the lower margin of each in contact. The pole will then traverse the left sleeve of one coat and the right sleeve of the other. The two sleeves on the other side receive the other pole in the same way and the coats are then buttoned up, the row of buttons coming in a straight line, midway between and parallel to the two poles. Another method is to make a lattice work of rope or belts between the two poles. Whatever method is used it is essential before placing the patient on the litter to test it first to make sure it will stand the necessary weight. In carrying the stretcher the two bearers should keep step but start with opposite feet, and the patient should travel feet foremost except in going upstairs or up a steep hill.

BANDAGING. To learn to bandage, a few simple practical lessons are requisite, such as the classes of the St. John's Ambulance Association afford. The two chief forms of bandage in use are the triangular bandage and the roller bandage. A large handkerchief with two opposite corners in contact forms a triangular bandage, which may be used in its triangular form as in making a sling, or rolled up like a scarf to form a bandage for fixing a splint or covering a wound.

To bandage an eye roll a handkerchief like a scarf, place the centre of the bandage over the eye, pass one end below the ear of the same side, pass the other end over the most prominent part of the forehead of the opposite side and tie the two ends firmly at the back of the head.

To bandage the scalp bring two opposite corners of a very large handkerchief in contact so as to make a triangle, place the triangle on the scalp with the apex behind, bring the other two angles round the forehead just above the brow till they meet behind, low down and covering the apex, tie them firmly and secure the apex to them with a pin. The triangular bandage recommended by the St. John's Ambulance Association has a base four feet long and two sides of two feet ten inches each and on it are printed figures showing the way it may be applied. The roller bandage is the one chiefly used by medical men. It must be applied evenly and firmly without being tight, or serious consequences may ensue.

REMOVAL OF CLOTHING from injured limbs. Always slip out the sound arm first in taking off the coat, as it is then easy to slip the coat off the injured arm. Trousers may often be drawn straight down after unbuttoning as much as possible, but if a leg be broken or seriously injured it is much better to slit the trouser up along the seam. In putting clothing on, the injured limb is clothed first.

FRACTURES may be simple or compound. In the former the bone only is broken; in the latter case the skin is broken, so that germs can reach the broken bone. Compound fractures must be first treated as wounds (See *Wounds*), and then as in simple fractures temporary splints applied to prevent movement until the doctor comes. In fractures of the *thigh or leg*, after the trousers and boot have been removed by cutting them, the best splint to use is the sound leg. After placing a folded handkerchief between the knees and another between the ankles, the limbs may be tied together by one handkerchief applied above and a second just below the knees whilst a third is applied above the ankles.

N.B.—A bandage must never be applied over the fracture itself, unless the skin is broken at this spot.

Fracture at the middle of the *upper arm* is best treated by three slips of wood or stout cardboard secured above and below by handkerchiefs. The arm must then be placed in a sling with the hand well raised, and the patient will then do well to walk rather than ride to the doctor. Fracture at the *wrist* requires a splint that passes from the root of the fingers to the elbow. The fingers can then bend comfortably over the edge of the splint. A second splint on the back of the hand and forearm is also desirable. A piece of wood padded with wool or flannel or several layers of stout cardboard may be used and the splints should be secured by three handkerchiefs placed round the hand, just above the wrist and below the elbow. The arm is then placed in a sling. Fracture of one of the bones in the *hand* is best treated by placing a small door-handle, tennis or billiard ball in the palm of the hand and bandaging the fingers over it.

Fracture of the *collar bone* is best treated by passing one end of a duster or large handkerchief over the shoulder and under the arm and securing this end to the rest of the handkerchief with safety pins. A loop is thus formed, which encloses the shoulder. The other shoulder is treated similarly. Each handkerchief thus presents a free end and these are now firmly knotted together over a third handkerchief which is folded and placed in the small of the back. The shoulders are thus drawn back as far as possible, and the arm of the injured side is then supported in a sling. Fracture of the *jaw* requires two handkerchiefs, one passing from below the chin to the top of the head, where it is firmly tied, and the other from just above the chin to low

down at the back of the head where it is tied and the two handkerchiefs should then be tied together.

DISLOCATION is the displacement of one of the bones that forms a joint, a condition which involves the tearing of one or more of the ligaments that keep the bones in position. Pain, deformity and impaired movement result and continue as a rule until the dislocation is reduced, though rarely the displaced bone has been known to hollow out for itself a new socket and produce a joint in its new situation. The joints most liable to dislocation are the jaw, finger and shoulder; the knee, be it noted, is very rarely dislocated, and when popularly said to be "put out" either the joint is damaged internally or the knee cap is broken. The *jaw* is often dislocated in yawning too widely, when the sufferer finds he cannot close his mouth. Dislocation generally occurs on one side only. The treatment, after protecting the operator's thumbs by wrapping them up well in handkerchiefs, is to press on the back teeth of each side firmly with the thumbs whilst the fingers are placed outside the mouth, and below the jaw, and the chin pressed well upwards by them. The *finger* when dislocated may be treated by a steady pull so made as to tend to straighten the finger.

N.B.—Dislocation of the thumb, shoulder and other joints should not be treated beyond placing the affected limb in a sling until the doctor comes.

SPRAINS are the ill effects presented by tendons and ligaments, which have undergone a strain. The best treatment is absolute rest at first and cold. The latter is usually applied by bandages soaked in some evaporating lotion such as plain water, eau de Cologne, or methylated spirit and liquor ammonii acetatis of each an ounce, and water six ounces, so that the whole makes eight ounces.

FITS, using the term in the broad sense to include loss of consciousness from any abnormal cause, require "first aid." The first point to observe is whether there are convulsions or not. If convulsions are present, loosen the clothing, hold the patient firmly down by pressing on the limbs and forehead, and *not* on the chest or stomach, and place some hard body between the teeth to guard the tongue from being bitten. In childhood, repeated convulsions may be relieved by an enema, by some grey powder on the tongue and by a mustard or a simple hot bath. If convulsions are absent, the loss of consciousness may be due to fainting, to apoplexy, to alcohol or other poison, or to fracture of the skull. The circumstances of the case and the odour of the breath may help in deciding if poison or drink is the cause; examination may show bleeding from the nose, mouth or ear, which would point to fractured skull; in apoplexy the patient is usually a middle-aged, well-nourished man, the face is usually flushed, the unconsciousness prolonged, the breathing snoring in character, and the onset sudden; in fainting the patient is usually a young girl, the face is pale, the breathing quiet and shallow, and consciousness is usually soon regained.

Having ascertained the above points, if the case be regarded as a *fainting fit*, make sure that loss of blood is not the cause, as a burst varicose vein in the leg is not rare, and much bleeding may occur under a skirt before it is noticed. The treatment for a faint should be loosening the clothing, giving fresh air, putting the head down and the feet up and applying smelling salts and wet handkerchiefs or eau de Cologne to the face; stimulants are rarely necessary. In fainting due to loss of blood, the latter should be treated first. In *apoplexy* and *fractured skull*, it is very important to withhold all stimulants, which unfortunately are usually immediately given; the head should be well raised, and the patient turned on the side as breathing is then less laboured. In unconsciousness due to *poisoning* by alcohol or otherwise the patient should be roused if possible and an emetic then given, hot water and mustard being the best. Artificial respiration may be necessary and care should be taken to keep the patient warm.

DROWNING may cause death after two minutes' submersion, but life is often retained for a much longer time, and one apparently drowned may be clutched from the jaws of death by persevering treatment of the right kind. The Royal Humane Society have issued most valuable instructions which may often be seen at riverside resorts. The instructions may be summed up by saying, first, clear the air passages; secondly, perform artificial respiration; thirdly, restore the warmth of the body whilst medical aid, blankets, and dry clothes are sent for.

The air passages are best cleared by turning the patient over on his face with one arm under his forehead, and compressing the lower part of the chest. The patient should then be turned on his back, a rolled-up coat placed under his shoulders and the tongue drawn well forward, and if necessary held in a handkerchief by an assistant. The braces or stays are then loosened and artificial respiration begun. The method usually adopted is that of Sylvester.

> The operator stands at the head of his patient, grasps both arms just below the elbow and draws them up above the head, when he pulls on them, as this often stimulates inspiration. The arms are kept in this position while one, two are counted. The arms are next grasped just below the elbow, and then carried down against the sides of the chest and firmly pressed together. The chest is thus compressed and the air expelled. One, two is again counted and air then drawn into the lungs, by drawing the arms up over the head as before.

The method is a simple but fatiguing one, and it may be necessary to continue it without interruption for two hours. Meanwhile, if assistance can be obtained, the circulation should be stimulated by briskly rubbing the legs. As soon as natural breathing begins it may be discontinued, and treatment then directed to promoting warmth. Hot blankets, dry clothes and hot bottles or bricks wrapped in flannel to the feet are required, hot coffee or brandy are given as soon as the patient can swallow or, if he cannot, these should be given as an enema. Later on injuries due to the patient having struck against piles or rocks may require attention, and pneumonia has to be feared.

SUFFOCATION, from various causes, may require the same method of artificial respiration, followed by warmth and stimulants, as in the case of *Drowning* (which see).

HÆMORRHAGE OR LOSS OF BLOOD may be from an artery, a vein or a capillary. In arteries the blood flows *from* the heart and escapes from a wound in a bright scarlet intermittent stream; in veins the blood flows *to* the heart and escapes in a dark continuous stream; in capillaries the blood is flowing from arteries to veins and escapes as a steady oozing. Owing to these facts it is widely taught that arterial hæmorrhage should be arrested by compression of the wounded artery at a spot nearer the heart, whilst venous hæmorrhage should be treated by pressure over the vein further from the heart than the wound. The writer has seen so many amateur attempts at this method sent to the casualty room, which have been complete failures, that he recommends pressure in all cases to be applied to the wound itself whenever possible. The limb should always be raised, and all tight clothing, garters, bandages and the like between the wound and the body removed. A firm pad can always be improvised by placing a smooth pebble or cork in a clean handkerchief and folding it up. The pad may then be secured in position by a second handkerchief folded like a scarf. While the pad is being prepared, the bleeding may be controlled by pressure with the fingers. If pressure on the wound itself fails to arrest hæmorrhage, as happens at times, additional pressure may be applied—nearer to the heart than the wound for arterial hæmorrhage, and further from the heart for venous hæmorrhage. Wounds in the palm are best treated by placing the pad in the closed fist, then binding up the fist firmly, and finally bending the elbow and securing the hand to the upper arm.

When the wound is too extensive to apply pressure to it, and arterial hæmorrhage is present, a *tourniquet* improvised as follows should be applied higher up the limb. A pad made as above is placed over the main artery and secured in position by a handkerchief folded into a scarf and firmly tied. The size of this pad should be about that of hal

a tennis ball and the round side be next the skin. A stick is then inserted beneath the handkerchief on the opposite side to the pad, or it may be included in the knot of the bandage. By twisting the stick round and round the bandage is steadily tightened until hæmorrhage is arrested, when the stick must be prevented from unwinding by a bandage at each end.

In capillary oozing, the application of an astringent as well as of pressure is useful. The best is suprarenal extract or adrenalin, or hamamelis, sold also under the name hazeline; perchloride of iron and alum should be avoided, if possible, as they make the wound very slow in healing. Warm applications promote hæmorrhage, but ice or very hot applications check it and may be of service. Cobwebs check capillary oozing, but are a bad application because of the dirt and germs they introduce.

Bleeding may occur from a site to which pressure cannot be applied, e.g., the nose, lungs, stomach, rectum, bladder, or womb. The treatment for these must be considered separately:—

NOSE BLEEDING. Do not lean forward with the head over a basin, but snuff up cold water and then lean back. The collar should be loosened and cold may be applied to the back of the neck, as in the old fashioned method of putting a large key down the back. In severe cases a doctor will be required, to plug the nose with gauze soaked in hamamelis or adrenalin.

BLOOD SPITTING may be profuse in consumption and other conditions. The treatment is complete rest in bed, talking in a whisper only, a little ice to suck and a sponge bag containing ice may be placed over the heart. Coughing should be checked as much as possible, and when the doctor comes, he will probably inject morphia for this reason. No stimulants should be given.

VOMITING BLOOD may be due to blood that has come from the nose or the lungs, and been swallowed, but if not it is due to bleeding from the stomach and may be very severe. The patient should then be kept lying still, a little ice, but very little, should be given him to suck, and no medicine given by the mouth, as anything which may cause vomiting will increase the bleeding. The doctor will probably inject adrenalin under the skin, as this will circulate in the blood and contract up the mouths of the bleeding vessels in the stomach.

STOMACH, RECTUM, ETC. In cases of bleeding from the stomach, rectum, bladder, or womb, the patient should be kept lying down until the doctor arrives.

FISH. See *Food*.

FISSURE of the anus is a crack in it, difficult to heal, generally caused by piles. The symptoms caused are great pain on passing a motion and for an hour afterwards. The treatment is best in medical hands.

FISTULA, literally a pipe or flute, is a canal with rigid walls, opening at one end into a hollow viscus, whilst the other end is either blind or opens on to the surface of the body; it is caused by disease and discharges slime or matter. Such a condition is most often found near the anus or in the lower bowel. The treatment is surgical.

FITS. See *Apoplexy, Convulsions, Epilepsy, Fainting, First Aid, Hysteria*.

FLAT FOOT or Splay Foot is due to the normal arch of the foot giving way so that the inner border of the foot comes in contact with the ground and much pain with a clumsy gait results. In the normal foot, the weight is borne by the heel, the outer border of the foot, and the toes and ball of the big toe, whilst the inner border is not in contact with the ground and bears no pressure. The normal condition of the arches of the foot is maintained by the muscles of the calf, and the muscles and ligaments of the foot. All conditions, which debilitate these, predispose to flat foot. The chief of these is prolonged standing. Hence policemen, shop assistants and laundry women are specially prone to suffer. Other causes of flat foot include those which displace the normal position of the foot, such as high-heeled boots and knock-knee. In the latter the feet are separated, and the soles turned outwards, and the weight thrust on to the inner border of the foot instead of the outer border. The *treatment* in most cases is to wear low-heeled, broad-toed boots, to reduce the amount of standing, and to increase the amount of exercise suited to strengthen the calf muscles. Going upstairs on tip-toe, dancing, skipping, and cycling are such exercises. If this fails, rest in bed for a week should be tried, and the above treatment resumed, and if necessary special boots or an operation may be resorted to under medical advice.

FLATULENCE is due to an excessive formation of gas in the stomach and intestines. It is mainly produced by yeasts and bacteria, which either live normally in the intestine or have been introduced in the food, but is partly due to swallowed air. As a certain amount of gas formation is a normal part of digestion, it is not surprising that indigestion is often accompanied by an excessive production of gas. The chief *causes* are constipation and certain articles of diet, e.g. new bread, pastry, an excess of sugar, thick soup and partially fermented alcoholic liquors, but in the course of typhoid fever, peritonitis and certain forms of hysteria, an acute flatulent distension sometimes occurs, which cannot be thus explained. The *treatment* in most cases consists in taking a purge combined with one of the carminatives recommended below, and in restricting the diet by excluding the articles named above. Carminatives are remedies which expel wind, the most useful of which are peppermint water, spirits of camphor, sal volatile and cajuput oil, and in severe cases of flatulent distention the best is a turpentine enema. [Refer to *Enemata*.]

FOMENTATION is best made as follows. Lint or clean flannel is soaked in boric lotion (a saturated solution of boric acid in water), or in carbolic lotion (1 in 40), either of which are boiling. The lint is then wrung out quite dry. This can only be done by placing the lint folded up in a wringer—a clean towel serves very well—and then forcibly wringing the towel and the enclosed lint until no more fluid can be expressed. As this should be done quickly, before the lint has time to get cold, it is desirable for two people to work together, one at each end of the towel. The lint is then applied to the affected part and immediately covered by oilskin or mackintosh so cut that it overlaps the lint completely. It is a common mistake to cut the oilskin too small, and this spoils the fomentation, as it is our purpose to shut in the warmth and moisture of the lint completely, or evaporation will occur and cold instead of warmth result. The oilskin is then covered with a pad of wool or tow and a bandage applied lightly. Instead of the antiseptic fomentation above mentioned, which is the customary treatment for a suppurating wound or whitlow, fomentations are often used instead of poultices to apply to unbroken skin, and may have belladonna, laudanum, or turpentine sprinkled on them just before they are wrung dry. The two former act as pain soothers, the last as a counter-irritant. The term fomentation always refers to a *hot* application. It is, therefore, a mistake to talk of "hot fomentations" as though they had to be distinguished from cold ones.

FOOD is composed of five classes of food stuff, viz., proteid, fat, carbohydrate, water and salts. The proteid class includes lean meat, the gluten of bread, the legumin of peas, and white of egg; the fats include butter, cream and oil; the carbohydrates include sugar and starch (the latter is the chief ingredient of bread, potatoes and rice); salts include in addition to table salt or sodium chloride, phosphates and carbonates, but not sulphates. Submitted to ultimate analysis proteid is found to consist of carbon, hydrogen, oxygen, nitrogen, sulphur, and in some cases of phosphorus; fat and carbohydrates to consist in different proportions of carbon, hydrogen and oxygen only. Hence proteids are the only nitrogenous foods. It was formerly taught that nitrogenous foods were flesh formers and the fats and carbohydrates were heat producers, but this view is obsolete. In round number it is found that 5.000 grains of carbon and 300 grains of nitrogen are required per diem, to maintain the health of a man of average weight doing average work.

These amounts are obtainable by a great variety of different diets, but unless a certain quantity of food rich in proteid be taken, a great excess of carbon must be taken to obtain the requisite nitrogen. For instance, two pounds of bread and threequarters of a pound of lean meat provide the necessary amount of carbon and nitrogen, whereas a

dietary of bread alone necessitates four pounds of bread a day being eaten. This gives the 300 grains of nitrogen but an excess of carbon to the extent of 4,000 grains. A dietary in the same way limited to lean meat necessitates six pounds being eaten daily. This gives the carbon necessary with an excess of nitrogen amounting to 1,000 grains. It is clear then a mixed meat and vegetable diet is the most suitable. This is so not only because the inclusion in the dietary of an excess of nitrogen or carbon is wasteful, but because this excess has to be got rid of, and the body may fail to do this. The excess of nitrogen may cause gout, and an excess of carbon may be stored as fat.

A GOOD DIET. In selecting a diet we have to consider how best to combine palatability, efficiency and economy. With regard to *economy*, the cost of the nitrogenous foods is much higher than the fats or carbohydrates. Nitrogen is much cheaper in the form of dried peas or beans, and of eggs and cheese, than in the form of fish, flesh or fowl. The cost of vegetable oils is far less than of animal fats. With regard to *efficiency*, the cheaper foods above mentioned are equal to the dearer, provided they can be digested. Unfortunately, peas, cheese and olive-oil are not so easily digested as good meat and good butter. Hence those engaged in sedentary occupations do wisely to rely on meat and butter, and to leave cheese and peas in any quantity for the use of the labouring man, engaged in healthy outdoor work. Muscular work requires much more food than mental work, and fortunately carries with it an increased appetite and greater digestive power. The popular belief that fish is good for the brain is merely an expression of the need for easily digested food in the case of the brain worker. The diet should include raw fruit, the vegetable acids of which are good for the health. Greens are also desirable, because the green colouring matter contains iron, which is required to make blood, whilst the remainder forms an indigestible residue that prevents constipation by stimulating the intestinal movements.

In childhood the desire for sugar and the loathing for fat is to be respected, but the sugar should be eaten at meals, and never between them. The colouring used must be of a harmless material. [See *Confectionery*].

INVALID DIETARY includes especially the following articles on which detailed information may be required:—meat extracts, meat juices, milk, casein, gelatine, eggs, peptonised foods, malt and farinaceous food, easily digested forms of fat and refreshing beverages.

(1) *Meat Juices and Extracts.* We must carefully distinguish the "meat extract," like beef tea, from the "meat juice," like raw meat juice. The former stimulates the appetite but contains far less nourishment than its appearance suggests. The meat juice on the other hand contains much nourishment in an uncoagulated and therefore digestible state. Whenever possible both beef tea and raw meat juice should be home made and prepared only a few hours before use. The recipes will be found under the separate heads. But when such preparation is not possible, the tinned extracts and juices will be found most valuable, provided care be taken in the choice of a brand, as adulteration with blood and other undesirable bodies has been detected in certain cases. The reliable meat extracts include Liebig, Bovril, Armour's Extract and Brand's Essence amongst others. The meat juices are prepared by forcing out the juice from inside the meat fibres in great presses and then concentrating this by evaporating down in vacuo at a low temperature so as to avoid the coagulation that heat would cause. Examples are the meat juices prepared by Brand, Armour and Valentine.

In most forms of illness the above are well borne, but in gout and diseases of the kidney, all meat extracts should be withheld, as they necessarily increase the work of the kidneys, which in the diseases mentioned require rest.

(2) *Milk* is invaluable in invalid diet, though it often requires to be rendered more digestible. The subject is discussed under *Infancy*. One of its nourishing ingredients, "casein," is now extracted on the large scale and sold as a soluble concentrated food, which it certainly is. This may be used to advantage to enrich a fluid diet. Casein is prepared in different ways by various makers and sold under such names as Casumen, Eucasin, Protene, Plasmon. With the addition of egg, protene is also made up into material like bread, which is used as a starch-free substitute for bread in diabetes and obesity. Casein combined with glycero-phosphates is a valuable nourishment, sold under the name *sanatogen*.

(3) *Gelatine*, though not itself nourishing, makes the other food taken more so, and is of undoubted value in the sick room, as a great variety of jellies can be made and many forms of food may be given in it. [See *Jelly*.]

(4) *Eggs* beaten up raw are readily digested and most nourishing. Lightly cooked they are suitable to convalescence in most cases. The white of the egg dissolved in water is also largely used. [See *Albumen Water*.]

(5) *Peptonised Foods* are foods digested artificially, and used to reduce the work of the digestive organs. They are often of great use for short periods, but their prolonged use results in the loss of digestive power from lack of exercise. Of the many forms on the market Somatose is the one chiefly used at present. This consists of albumoses and is in the form of a powder that dissolves in water, milk, etc., and may be added to liquid food or to nutrient enemata. [To peptonise milk or other food see Peptonised Food.]

(6) *Malt and Farinaceous Foods.* [See *Infants*.] Farinaceous puddings are often used too freely in sick cooking; rice, unless well cooked, cornflour, arrowroot and the like are not very digestible and often cause flatulence. Rusks, toast, or other material of a hard, dry, and brittle nature is often better, as thorough mastication then brings the saliva into play. Malt extracts provide sugar in a partially digested form that is often useful. Honey also provides predigested sugar that has been digested by the bees, but this disagrees with many invalids, though it should be borne in mind during convalescence.

(7) *Fat* is best given as milk, fresh cream and good butter. Amongst the other ways in which fat may be given, cod liver oil is the chief, and this may be emulsified to advantage or given with malt extract. The use of the mineral oils has been tried, but it has been proved that they are not absorbed into the system.

(8) *Refreshing Beverages* are of much importance: lemonade, imperial drink, aerated water, and black currant water are the chief. [Refer to *Cookery*.]

The following tables may be of service, though the dietary for such diseases as require special care will be found under the names of each.

Suited to Invalids.	Suited to the Healthy only.
Whiting. Turbot. Sole. Plaice. Cod. Fresh Haddock. Flounder. These are more digestible when boiled than when fried.	Oily fish, e.g., Salmon. Mackerel. Herring. Eel. Preserved Fish, e.g. smoked haddock. Fish eaten whole, e.g., white bait.
Oysters.	Crab, lobster and shell fish, other than oysters.
Fowl (wing and breast only). Pheasant (not high). Pigeon.	Fowl leg. Duck. Goose.
Mutton. Beef. Lamb. Fried Bacon. Stewed Tripe.	Pork. Veal. Venison. Preserved meat. Sausage.

Suited to Invalids.	Suited to the Healthy only.
Junket.	Cheese.
Grapes free from skin and pips. Bananas. The juice only of orange, lemon and currants. Baked apples without core or peel.	Rhubarb. Cucumber. Melon. Stone Fruit. Gooseberry and Strawberry. Figs. Preserved Fruits. Nuts.
Boiled floury potato. Spinach.	Mashed, fried, baked, or new potato, greens other than spinach. Roots, e.g., carrot, turnip, etc.
Beef-tea or Broth. Thin Soups, not highly spiced. Jelly. Well cooked farinaceous puddings. Custard. Raw or lightly cooked eggs.	Highly spiced and thick soups. Sauces made with melted butter. Heavy puddings. Pastry. Fritters. Hard boiled eggs.

FORENSIC MEDICINE is medicine in relation to law. It deals with such matters as the detection of the cause of death in cases of alleged murder or suicide; the duties of a medical witness, and the like.

FRACTURE. See *Broken Bones, First Aid.*

FRECKLES. See *Complexion.*

FRIAR'S BALSAM, or compound tincture of benzoin, is a useful application to cuts when clean, but should not be used when there is dirt in the wound. A teaspoonful of it to the pint of boiling water makes a useful inhalation for cold in the head or on the chest.

FRICTION. See *Massage.*

FRIEDRICHSHALL water contains sulphate and chloride of soda, and forms a useful, mild aperient; a wineglassful should be taken before breakfast.

FROST-BITE. Even though the part appears lifeless, recovery can often occur provided the temperature be raised very gradually. The patient must not enter a warm room, and the affected part should be rubbed, preferably with snow. When the part comes to life, inflammation should be expected, which may be treated with fomentations or by wrapping up the inflamed organ in wool. The avoidance of alcohol or hot drinks in the early stage is also important.

FRUIT. See *Food.*

FUNCTIONAL DISEASE includes all disorders which are not accompanied by any change in the affected organ that can be detected either by the naked eye or the microscope. Of these diseases hysteria is the most common.

FURUNCLE is a boil [which see].

GALL BLADDER, a small bag attached to the under surface of the liver and communicating with the bile ducts. It receives the bile and stores it until the digestive processes require it, when its muscular walls contract and discharge the bile into the small intestine. Though present in most vertebrates from fish upwards, it is absent in the horse and the deer.

GALL STONES are stones developed within the gall bladder or the bile ducts. There are two kinds, red and white. The former arise from the bile, the latter from the walls of the gall bladder and ducts. The size varies from that of fine grit to that of a hen's egg. So long as the stones remain in the gall bladder no symptoms may occur, as post-mortems are constantly showing, but if a stone is forced down the bile duct acute pain, followed next day by jaundice, results. [Refer to *Colic.*]

GALVANISM. See *Electricity.*

GANGLION in physiology means a collection of nerve cells, but in surgery it denotes a swelling due to the sheath of a tendon having been forced out into a little pouch. It is most often met with on the back of the wrist, where it forms a little swelling like a marble under the skin but elastic to the touch. Before surgery had become aseptic these were treated by smashing them with a blow from a book, but such treatment is now replaced by pricking them under strict aseptic conditions. Before this treatment is resorted to wearing a disc of lead over them sewn into a wrist-band may be tried if desired.

GANGRENE is the death of part of the body from any cause. Obstruction to the circulation or very severe inflammation are the chief causes. If the obstruction be arterial the limb is dry and shrivels into a mummified condition known as dry gangrene, but if the obstruction be in the veins, the limb is engorged and active decomposition results; this is moist gangrene. The treatment adopted is usually amputation far above the gangrenous part, but at times the patient is not considered capable of standing such an operation. The gangrenous portion is then dried up as much as possible with zinc oxide and starch powder, and if there is much fœtor iodoform is used also. The part is kept in wool. Nature at times succeeds in separating the dead portion, but as a rule if the surgeon does not do this, death occurs, though often not for two or three months, especially in the dry form of gangrene.

GARGLE is commonly thought to cleanse the throat, but in reality does not in most people get further back than the tonsils unless it is swallowed. The following may be useful:—

To cleanse the tonsils:—Bicarbonate of soda, chlorate of potash, borax of each half an ounce, white sugar one ounce. A teaspoonful of the powder to be added to a tumbler of warm water; or, Bicarbonate of soda a drachm and sixteen drachms of a solution of carbolic acid of a strength of 1 in 20, to be put in a pint measure and water added to the pint.

To act as an astringent:—Alum half an ounce, water one pint, or port wine or stewed tea.

GASTRALGIA means neuralgia of the stomach. The treatment should be in medical hands.

GASTRIC FEVER. See *Typhoid Fever.*

GASTRIC JUICE is the secretion of the glands in the stomach wall. It is acid in reaction owing to the presence of hydrochloric acid and contains two ferments, pepsin and rennet, which act on lean meat and on milk respectively. The juice is germicidal and is only poured out when food is tasted, smelt, eaten, or is introduced into the stomach. Anxiety and other nerve disturbances prevent its formation. Normally as much as seven quarts are secreted daily.

GAS POISONING kills by asphyxia. Unconsciousness is rapidly produced. [See *Poisons.*]

GASTRITIS. See *Stomach, Inflammation of.*

GELATINE, a useful ingredient in sick diet. [See Food and Jelly.]

GENTIAN is the best of the bitter drugs. The dose of the compound infusion for the adult is one ounce. Taken shortly before meals it stimulates digestion.

GERMAN MEASLES. A disease distinct from English measles and affording no protection to an attack of English measles. Although the symptoms are very similar, the attack is milder. Young adults suffer from it more commonly than children. The patient himself is free of infection three weeks from the onset. There are no complications; recovery is certain; the after effect on the general health is trifling. Treatment is the same as for a mild case of measles. [Refer to *Fevers.*]

GERMS. See *Bacteria.*

GESTATION. See *Pregnancy.*

GIDDINESS. Dizziness, vertigo, are names for the same symptoms which has many possible causes. Looking down from great heights and many other causes are familiar to all, but it must be borne in mind that giddiness may be a symptom of indigestion, anæmia, Menière's disease, or epilepsy (to all of which refer).

GIN is a whisky to which oil of juniper is added. It contains 45 per cent. of alcohol. The juniper makes it a diuretic. It is largely used by the public whenever any trouble with the urine occurs. This is a serious mistake, because juniper is irritating to the kidneys and so is alcohol. Diluted and sweetened it is known as "Old Tom." No improvement occurs by keeping.

GINGER may be taken to relieve flatulence and stimulate digestion. Doses:—powdered ginger, ten to twenty grains; tincture of ginger, a half to one teaspoonful; syrup of ginger, a half to one teaspoonful. They should be taken in a little water.

GLAND. The term is applied to two distinct groups of bodies—lymphatic glands and secreting glands. The glands in the neck so often enlarged in tuberculous children are the lymphatic glands. *Lymphatic* glands act as filters to the lymph which passes through them by arresting the foreign bodies, including germs, which the lymph contains. Normally the gland destroys any germs it arrests, but abnormally the latter succeed in destroying the gland.

Secreting glands, e.g., the liver or kidney, produce some fluid of a characteristic nature like bile, called the secretion, which is made use of elsewhere, or else an excretion, like urine and sweat, which is expelled without being used in the body. Secretions are subdivided into *external* ones that are poured on to the surface of the skin or mucous membrane, e.g., oil of hair glands, or saliva, and *internal* ones that are absorbed into the circulation and used to alter the character of the blood, e.g., the thyroid secretion from the thyroid gland in the neck. It has been shown of recent years that many glands formerly thought to produce an external secretion only produce an internal secretion also. Thus the pancreas produces an internal secretion the absence of which causes diabetes, the kidney one that effects nutrition, and the absence of which causes rapid wasting; and it is possible that all glands may be proved to have internal secretions. Professor Starling has recently shown that the intestinal juice besides containing the body that digests cane sugar has a second body, enterokinase, which is absorbed by the blood and on reaching the pancreas stimulates it to activity. Enterokinase may thus be regarded as the internal secretion of the intestinal glands. The subject has a great practical bearing, partly because the defective action of one gland may be entirely due to the failure of a far distant one, to which treatment should be directed, and partly because these internal secretions can be isolated and used in the treatment of those cases in which they are known to be deficient.

GLANDERS OR FARCY, a disease of horses, often attacking also the grooms. The disease produces serious ulceration in the skin, nose, and jaws with a profuse yellow fetid discharge. It is often fatal.

GLAUBER'S SALTS are sulphate of soda, a useful aperient, similar in action to Epsom salts, but less nauseous. The dose is a quarter to half an ounce dissolved in half a tumbler of water or peppermint water; it should be taken before breakfast.

GLAUCOMA is a serious disease of the eye, in which there is an accumulation of fluid within the eye-ball, the pressure of which produces blindness. It may have a gradual or an acute onset. In the acute form the earlier symptoms of headache and vomiting often cause it to be mistaken for a bilious attack at first. Medical aid is of the utmost importance.

GLUTEN, the albumin of bread. [See *Bread.*]

GLYCERINE, obtained in the manufacture of soap, is used both externally and internally. It protects the skin from excessive drying and is thus useful in chapped hands, lips or nipples. It may be used either pure or in the form of glycerine of starch. Glycerine of belladonna is largely used for the relief of pain by application to the skin *on* fomentations or otherwise. Internally glycerine is used as a paint for the throat in the form of glycerine and lemon juice, or if an astringent is required as glycerine and tannic acid. Glycerine of borax diluted seven times with water and a little tincture of myrrh added is a good mouth-wash. In diabetes, where sugar is not allowed, glycerine is often used as a sweetening agent, but in taking glycerine, for a throat cough for instance, it is well to acidulate it with a little lemon juice or other acid to reduce the intense sweetness. As an aperient, glycerine given by the mouth has but little effect, but given as an enema, a couple of drachms excites an action of the bowels almost directly.

GODFREY'S CORDIAL. See *Opium.*

GOITRE, or Derbyshire neck, so called from its frequent occurrence in Derbyshire, is a tumour of the neck caused by an overgrowth of the thyroid gland. In the common form no symptoms are produced other than pressure effects due to the pressure of the tumour, but in exophthalmic goitre the secretion which the thyroid pours into the blood is of an abnormal character and produces rapid pulse, prominence of the eye-balls, tremor and nervous excitability. Recovery occurs in the exophthalmic form in the course of some months, but a quiet life and medical supervision are requisite. [Refer to *Cretin.*]

GOLDEN OINTMENT contains two per cent. of yellow oxide of mercury in vaseline. It may be applied to indolent ulcers.

GOULARD'S WATER, or lead lotion, is a soothing and astringent lotion, which may be applied to bruises or to weeping eczema.

GOUT is a disorder in which the blood is laden with the soda salts of uric acid. The consequence is that deposits of urate of soda are apt to occur wherever the circulation is feeble, and inflammation is often set up around these deposits. The *causes* of gout are over-eating, over-drinking, lead poisoning and hereditary tendency. The disease is rare before thirty and occurs at an earlier age in the sufferers from lead poisoning than in other cases. The *symptoms* of acute gout usually begin in the night as intense pain in the big toe, which feels as though it were in the grip of a vice. Next morning the toe is hot, red, shining and very tender, whilst the whole foot is swollen. Other joints are often attacked next day, especially the fingers, wrists and knees, whilst the elbow is more often attacked in gout than in rheumatism. The urine either contains gravel or deposits a brick dust sediment when it gets cold. The attack usually lasts ten days and relapses are common, but pain can be relieved within forty-eight hours by suitable treatment. After an attack the general health is often much improved. Before the attack a condition known as suppressed gout often exists, in which the system suffers from being fed by blood laden with uric acid and symptoms result, e.g., nervous depression or irritability, dyspepsia, palpitations, bronchitis, and eczema. Suppressed gout also is common in the girls of a family who come of a gouty stock, the sons more often presenting gout in the joints. Repeated attacks of acute gout at steadily diminishing intervals often produce *chronic gout* in which the joints are permanently deformed and deposits of urate of soda known popularly as chalk stones, persist both round the joints and in the ears. A sallow complexion, rigid arteries and impaired digestion usually accompany chronic gout, though the mental power may remain unimpaired. Apoplexy is a common complication in these cases.

The *treatment*:—Those who come of a gouty stock can often ward off the disease by avoidance of alcohol and of excessive meat eating and by leading an open air life with plenty of exercise. Men engaged in the many trades entailing exposure to lead poisoning, must all be liable to gout so long as this evil is not remedied. Those who are the subjects of gout should eat butcher's meat only once daily, and should take plenty of green food; potassium chloride may take the place in the saltcellar of the usual table salt, or sodium chloride. Such persons should avoid rhubarb, asparagus, pickles, smoked foods, port, sherry, and beer. If any alcohol is taken, whisky, claret and hock are the least harmful. An attack of acute gout demands absolute rest, a milk diet, local applications to the affected joints and special gout medicine. The best local treatment is either hot soda baths or fomentations wrung out in strong solution of washing soda, but belladonna and glycerine,

opium, iodine and many other remedies are used. The best medicine in most cases is:—

> Two or three grains of calomel, followed by a black draught or seidlitz powder next morning, whilst citrate of potash one drachm, colchicum wine twenty drops, and chloroform water seven drachms, should be taken every hour for six doses, and then every four hours.

On this treatment patients usually obtain sleep on the second night, and obtain relief from acute pain by the following day. Chronic gout may be improved by hot air baths applied to the affected joints followed by massage; such a course of treatment is best obtained at Bath or Buxton, though the Dowsing radient heat treatment, often obtainable near home, may be of great service.

GRAFTING consists in supplying small pieces of skin from a healthy part and placing them on the surface of an open wound. The wound is then covered with a protective dressing, and in a few days some of the grafts grow and help to cover the raw surface with new skin.

GRANULATIONS are the new tissues formed on the surface of a wound prior to the skin growing over it. [See *Wounds.*]

GRAPE CURE is a mode of treatment now obsolete, in which grapes formed the chief article of diet, as much as eight pounds being taken daily. The teeth and digestion were often injured, but obesity and other disorders are said to have been improved by it.

GRAVEL present in the urine when passed demands treatment, but if only present when the urine cools, and if it dissolves again on warming, the symptom is not serious. A cayenne pepper-like deposit of uric acid is often passed in gout. Phosphates may be passed and make the urine milky, a condition often popularly confused with spermatorrhœa. Oxalates are also present at times as crystals in the urine. For these symptoms medical advice should be sought, or stone in the bladder or kidney may result.

GRAVES' DISEASE or Exophthalmic Goitre. See *Goitre.*

GREEN SICKNESS. See *Anæmia.*

GREGORY'S POWDER is a most nauseous preparation of rhubarb that should never be given now that so many more palatable and equally efficacious aperients for children are obtainable. [Refer to *Constipation.*]

GREY POWDER, chalk and mercury. A most valuable aperient especially for infants. Dose:—One half to two grains, according to the age of the patient.

GRIPES. See *Colic.*

GRIPPE is the French name for Influenza.

GROWTH. The height of an infant at birth is usually from 18 to 19 inches. At the end of the first year the average height is 27 inches; of the second year, 30 inches; of the third year 34 inches; and at the end of the fourth year, twice the height at birth. After this an annual addition of rather more than two inches is normal until the age of fourteen when, in the case of boys, the growth becomes more rapid. Between sixteen and eighteen the rate of growth usually diminishes, and as a rule at eighteen the full stature is reached. In girls the increase in height after fourteen years is generally much less than in boys.

An infant weighs as a rule about 7 pounds at birth. By the end of the first week it has recovered the weight lost during the first three days of life. During the next five months it should gain on an average an ounce a day. Its weight at the end of the first year is normally about 20 pounds, and at the end of the second year about 27 pounds. During the next seven years the child usually gains only four pounds annually, but after ten years of age the increase rises to eight pounds annually.

In rickets the weight is often excessive and the height below the average. In commencing phthisis there is often an arrest of growth and in fever a sudden increase of height. Bad sanitary conditions, want of light or food, indigestion, overwork and tobacco smoking all tend to stunt growth.

GRUEL. See *Arrowroot.*

GUAIACUM is a drug now being largely used in the treatment of chronic joint diseases.

GUARANA is a drug formerly much used to relieve sick headache, but it has now been supplanted by citrate of caffeine.

GUINEA-WORM is prevalent on the West coast of Africa. The adult worm lives beneath the skin of the legs and feet of human beings, and gives rise to ulcers. The worm discharges its eggs through the ulcer whenever it is brought in contact with water, as it often is when its human host fords a stream or bathes. The eggs hatch and the young worms attack small water-fleas (Cyclops) in which they pass part of their life history. It is probable that the disease is conveyed to man by drinking water containing water-fleas or infected by them. The natives are clever at extracting the worms through the ulcer by winding up a few inches a day on a stick without breaking the worm. Any attempt to pull the worm right out in the course of a few moments fails, as the worm breaks, and much irritation to the surrounding tissue results. Hence the native fashion of extracting a few inches a day until all is removed.

GULLET is the food canal connecting the throat to the stomach. It has muscular walls which force the food towards the stomach; hence swallowing is possible with the head below the stomach, as in the case of a horse grazing. The length of the gullet is nine inches and the distance from the front teeth to the stomach fourteen inches. Obstruction in the gullet may arise from the lodging of a fish-bone, spasm due to hysteria, or stricture due to cancer, or aneurism of the aorta.

GUMBOIL. An abscess between the gum and the jaw due to a decayed tooth. It should be encouraged to burst internally by holding hot water in the mouth and should be lanced as soon as matter has formed.

GUM, SPONGY, may be due to scurvy. The local treatment required is an astringent mouth wash such as tincture of myrrh, half a drachm, in an ounce of water, or alum gargle.

GUN-SHOT WOUNDS. See *Wounds.*

GYMNASTICS. See *Exercise.*

HABIT-SPASM is a condition often mistaken for St. Vitus's Dance. The cause is unknown, though apparently the frequent repetition of some trick ends in its performance involuntarily in many cases. The symptoms are rapid, involuntary movement; the same movement is repeated often every few minutes. Jerking of the head or raising the eye-brows are common forms. Rest, tonics and fresh air, gymnastics and avoidance of worry do good.

HÆMOPHILIA, a condition in which there is a tendency to excessive bleeding from trifling injuries. The cause is a defective power of blood clotting, hæmorrhage being normally checked by clotting. The disease is hereditary, the sons of a family suffering, whilst the daughters, though presenting no symptoms, transmit the disease more often than the sons do. Chloride of calcium has been recommended.

HÆMORRHAGE. See *First Aid.*

HAIR grows from a papilla at the bottom of a pit in the skin known as the hair follicle. When the hair has reached a certain length it is cast off and replaced by a new one formed from the same papilla. Should the papilla atrophy, no more hairs can grow in that follicle. With advancing years or prematurely as the result of inflammation such atrophy does occur in a large number of follicles and baldness results [See *Baldness*]. Each hair is oiled by two oil glands which pour their secretion into the follicle; hence pomatum and the like is uncalled for and the complete removal of all grease by shampoo powders, containing caustic alkalis, is also unnatural, and does harm if frequently repeated, as it renders the hair brittle. Sponging the hair daily with water only and then rubbing it thoroughly dry is probably the best plan, and in the case of short hair does not take an inconvenient time. The colouring matter of the hair is removed in advanced life by wandering cells which make their way in from the skin, and the hair also contains some bubbles of air at this time. The two causes together produce the whiteness of the hair. This change of colour may occur as the result of emotion within a few hours. Natural curling of the hair is due to the follicle

having a spiral form. Artificial methods are all more or less harmful, as they either dry the hair too much or drag on its roots. Singeing is of no real use whatever. [Refer to *Baldness, Dandruff.*]

HAIR-DYES to turn grey hair dark are, as a rule, objectionable. They contain the salt of a metal, e.g. lead, silver, or bismuth, the sulphide of which is black. The necessary sulphur is either supplied by the skin itself or is contained in the mixture. The disadvantage is that the metal is apt to irritate the skin, and may be absorbed and poison the system. Cases of lead poisoning have occurred in this way. Bismuth is safer than other metals. To dye dark hair a golden colour peroxide of hydrogen is the chief dye used.

HALLUCINATION is a mental image, which has no corresponding object to cause it. Hallucinations occur in many mental conditions of which delirium tremens is the best known. In this condition, rats, coins, and other fancied objects are visible to the sufferer, who may even pick up an imaginary coin, hand it to a second person and receive it back again without doubting the reality of the object for a moment. Hallucinations are not absent from the healthy mind; for instance, a clock may appear to distinctly strike thirteen, the last stroke being then an hallucination.

HAMAMELIS is the witch hazel of America. The tincture of hamamelis may be applied on lint to a bleeding surface to stop bleeding. Hamamelis ointment is useful for chapped hands or piles. The drug is sold also under the name of hazeline.

HAMMER TOE is a deformity affecting, as a rule, the second toe, which becomes fixed in a bent up position, causing a corn to form at the top of the bend. It may usually be prevented by avoiding pointed boots. When present it may need an operation, and at times amputation.

HARE-LIP is often associated with cleft palate. The two conditions arise from a common cause, viz., arrested development before birth. At the eighth week of pregnancy hare lip and cleft palate is present in the normal fœtus, but long before birth the two halves of the lip and palate normally grow together and meet in the mid line. Failure to do so is the cause of hare lip and cleft palate. Maternal impressions, e.g., seeing a rabbit, etc., shortly before the birth of the child are thus seen to have no connection with the defect, as this arises from some cause unknown, before the third month. The surgeon can remedy the condition.

HARTSHORN. See *Ammonia.*

HARVEST BUG. The bites are best treated by dilute ammonia, or by a strong solution of washing soda or by the blue bag.

HAY FEVER is an affection of the nose, due to the irritation of the pollen of grasses. It attacks certain people only and runs in families. The symptoms resemble a common cold; asthma may be present as a complication. The treatment should be the avoidance of the hay-fields when the grass is ripe, and the use of tonics and soothing applications to the nose such as:—

> Friar's Balsam a drachm to the pint of boiling water; inhale the steam; or Creosote ten drops to the pint of boiling water: inhale the steam.

HAZELINE. See *Hamamelis.*

HEAD-ACHE may be due to the brain being fed by poor or poisoned blood, or due to congestion of the circulation in the brain or to inflammation or to tumour within the skull. A very large number of possible causes are thus grouped together. The blood may be poisoned by constipation, by an abscess, scarlet fever, or chronic Bright's disease, etc., etc. In short, headache must be regarded as a symptom that should be considered in connection with the others present.

> A cup of hot tea, sipped slowly, a wet handkerchief on the forehead, rest in a quiet dimly lighted room and a dose of ten grains of phenacetin may always be tried.

[Refer to *Bilious Attacks.*]

HEALTH depends on sanitary surroundings, e.g. a sandy soil, good drains, good ventilation, a pure water and milk supply, etc. It also depends on the habits of the daily life which should be regular in regard to meals, bowel action, sleep and exercise, but sufficiently varied in regard to work and recreation to prevent monotony. A hobby, that promotes out of door occupation, is always good and the work should be interesting if possible. An annual holiday is most desirable, and no effort should be spared to secure a complete change of air and scene by it, though it is often wise to have a few days near home first in order to get fit before going abroad. [Refer to *Childhood, Dangerous Trades, Death Rate, Exercise, Infants, Sewage Disposal, Ventilation.*]

HEALTH RESORTS may be divided into open sea, seashore, mountain, desert and woodland. The *open sea* in the form of a long sea voyage is not so often recommended as formerly, as the chance of prolonged sea-sickness, stuffy cabins and monotony outweigh many of the advantages, especially in the treatment of early phthisis. The more bracing *sea-side* resorts are suitable for scrofula and anæmia, indeed children with consumptive family histories are best sent to school by the sea, especially to Margate. The less bracing sea-side places are suitable for convalescence from acute illness, for advanced phthisis and bronchitis in the elderly; whilst cases of neuralgia, sleeplessness and nervous irritability are better away from the sea. The *mountains* are bracing, more so in Switzerland than in England, and are useful for anæmia, dyspepsia, mental overwork, early phthisis, and bronchitis in the young. They are bad for chronic bronchitis or emphysema in the elderly, for heart or kidney disease and for old age. The dry, even, and sunny climate of the *desert* and of dry plains suits gout, rheumatism, old age, disease of the kidney and such cases of bronchitis as suffer from excessive expectoration. The *woodlands* give shelter from winds, a moist atmosphere, even temperature and warm nights, and are suited to early convalescence, before the more bracing sea or mountain is thought desirable; also to the elderly, to nervous irritability, sleeplessness, and bronchitis accompanied by dry hacking cough. *Plateaus* suit heart cases best, as they give level walks, bracing air, and a cool temperature. *Places of interest*, e.g., Athens, Rome, etc., are often invaluable for nervous breakdown, melancholia, and the like.

There are many health resorts which owe their value to the presence of mineral waters that may be used either as baths or taken internally. Such health resorts or *Spas* may be subdivided thus:—

Simple Waters, often hot, as in Bath and Buxton, useful in the treatment of gout, rheumatism, and constipation.

Salt Waters, as at Droitwich, Woodhall, Harrogate, Kissingen, Nauheim, Wiesbaden, and Baden-Baden, which are used chiefly as baths, being more bracing than simple water. Cheltenham would come in this group were it not that the waters there contain sulphate of soda, as well as salt, whilst Ems contains alkalies as well as salt.

Alkaline Waters, as at Vichy and Mont Dore. They are used in the treatment of chronic catarrh of the respiratory and digestive organs, and in gout, gall stones, and acidity.

Sulphated Waters, containing Epsom or glauber salts and other sulphates as at Hunyadi Janos and Friedrichshall. They are used for obesity and piles when only a short course of treatment can be taken.

Alkaline Sulphated Waters, containing a mixture of sulphates and alkalies, are milder than the former group and are used when the patients are thinner or a longer course of treatment is taken. They are used in the treatment of gout, gravel, constipation, and obesity. Carlsbad and Marienbad are examples.

Sulphur Waters, containing sulphides of hydrogen, calcium and other bodies, occur at Harrogate, Strathpeffer, and at Aix-la-Chapelle. They are used in the treatment of syphilis and many skin diseases.

Iron Waters, as in certain Harrogate springs, and at Tunbridge Wells and St. Moritz, are not so much used in the treatment of anæmia as formerly. Those prone to constipation are made worse by these waters unless suitable aperients are also taken.

Of the Spas open in the winter, Aix-la-Chapelle, Aix-les-Bains, Baden-Baden, and Wiesbaden are the chief.

HEART is a hollow muscular organ divided by a partition into the right side and the left side. Each side is composed of an upper chamber, the auricle, and a lower chamber, the ventricle, which communicate with each other by an opening guarded by a valve. The valve permits the blood to flow in one direction only, namely from auricle to ventricle. The right auricle receives the blood from the veins and pours it into the right ventricle. The ventricle then drives the blood to the lungs, whence it passes to the left auricle. The left auricle empties into the left ventricle, which drives the blood to all parts of the body except the lungs. Valves guard the outlet from each ventricle in order to prevent blood being sucked back when the ventricle dilates. *Disease* of the heart is either a defect in one of the valves, which then permits blood to flow in the wrong direction, or is a disease of the heart wall, which may become fatty or fibrous, and so lose its muscular power. Such defects often result in dilatation of the heart, which causes dropsy, shortness of breath, blueness of the face, lack of sleep and of digestive power. The treatment is to give rest and to effect the relief of congestion.

HEART-BURN is a symptom due to acidity in the stomach and not to anything wrong with the heart itself. The treatment is a teaspoonful of bicarbonate of soda in half a tumbler of water, which usually gives immediate relief for the time. The diet, however, requires regulating, new bread, farinaceous and sweet food being the commonest causes of this disorder.

HECTIC FEVER is an intermittent fever, coming on usually every night and accompanied by flushing, sweating, and prostration. It occurs most often when a deep-seated abscess is present, or in the more acute stages of consumption.

HEMIPLEGIA is paralysis of one side of the body. [Refer to *Apoplexy.*]

HEMP, or **CANNABIS INDICA,** is a drug used in the East to produce a form of intoxication. Many become the slaves of this drug, just as the Chinese do of opium, with disastrous effects on the health.

HENBANE or **HYOSCYAMUS.** See *Drugs, Poisons.*

HEREDITY plays an important role in the causation and the prevention of disease. In most cases the disease itself is not inherited, but the tendency to it is. A constitution with only a low resisting power to the invasion of certain germs is often transmitted, and the offspring, when exposed to infection later in life, then take the disease. Similarly a constitution with a high resisting power may be transmitted to the offspring, who then escape the disease though often exposed to infection. Hence we have some families prone to consumption, others to cancer, and again some races prone to a disease, whilst other races living at the same spot escape. For instance, plague attacks the blacks far more frequently than the whites. Just as we have certain constitutions that offer a suitable soil for certain disease germs, so we have inherited constitutions liable to become deranged in one particular way; for instance, gout, diabetes, and insanity frequently run in families. In these cases it is the tendency and not the disease which is inherited, and by strict attention to the laws of health harm may be avoided as a rule. The unstable nervous system of those with insanity in the family break down under the stress of many causes, e.g. overwork, anxiety, alcohol, acute bodily disease, or child-birth, and insanity or hysteria result. Hence the regulation of the life by medical guidance in such cases is most desirable.

HERNIA. See *Rupture.*

HERPES is commonly known as *Shingles*, which see.

HICCOUGH is caused by spasm of the diaphragm, due generally to irritation of the stomach. Sipping cold water and also holding the breath may relieve it. If these methods fail a teaspoonful of bicarbonate of soda in a half tumbler of water should be taken. Obstinate hiccup in the course of a serious illness requires medical care.

HIP is the joint formed by the head of the thigh bone fitting into a cup-shaped socket in the hip bone. The joint belongs to the ball and socket class and permits considerable range of movement though not so much as the shoulder does. On the other hand the hip is dislocated far less easily than the shoulder.

HIP-DISEASE is another example of the ravages of the bacillus of tuberculosis. Consumption of the bone and lining membrane within the joint occurs, the diseased portions break down into a yellow material like matter, the thigh is shortened, the muscles waste and finally the matter makes its way to the surface, and the thigh becomes fixed, often in a faulty position with the knee drawn up. Subsequently infection of the lungs may follow and phthisis develop. It is thus clear that the recognition of the early symptoms is of much importance, for if taken in time recovery may be effected. The disease is common in childhood; a family history of consumption is frequent; the pain is often referred to the knee cap at first and only later to the hip itself; the attitude is important, the knee of the affected side is bent and the weight is thrown on to the sound leg; the gait should be noted as a slight limp may be detected early; the flesh round the hips should be inspected and slight wasting looked for on the affected side. Medical aid should be called in if any of the above symptoms are detected. The treatment is to give the inflamed joint rest and the patient food and fresh air. If matter forms an operation will be required.

HOARSENESS. See *Laryngitis.*

HOMŒOPATHY is a system of treatment based on the empirical statement that "like cures like." Thus vomiting should be treated, according to this plan, by an emetic. The system was elaborated by Hahnemann, who taught that the smaller the dose the better. As most cases of illness tend to get well with suitable food, rest and fresh air, there can be little doubt that the addition of microscopic doses of this drug or that may more often than not be followed by recovery, and is certainly preferable to the overdrugging, free bleeding, and the like, which a century ago was so much in vogue.

HONEY is a mild laxative, and is thus a useful article of diet in districts in which the water is hard. It may also be used in sore throat, to relieve cough, and aid swallowing; for this purpose it is best combined with a little acetic acid and water or lemon juice. Clarified honey eight parts, acetic acid one part, water one part, sold under the name of oxymel (dose, one to two teaspoonfuls), is the best preparation if honey be used for sore throat. Honey and borax applied to the mouth and gums is a useful remedy for thrush.

HOOPING COUGH. See *Whooping Cough.*

HORSERADISH root contains the same ingredient as mustard, and may be used as a condiment to stimulate digestion.

HOSPITALS are given in full in the "Medical Directory." Of the general hospitals those with a medical school attached are the best, and such hospitals have well equipped special departments for the eye, throat, ear, skin, etc. Fever Hospitals in London are under the care of the Metropolitan Asylums' Board, with certain exceptions, of which the London Fever Hospital and the South Mimms Smallpox Hospital are two, and these receive paying patients. Paying patients are also received at:—

> Guy's, St. Thomas, the German (Dalston), Grosvenor for Women and Children (Vincent Square), the Chelsea Hospital, the Soho Square Hospital and the New Hospital for Women (Marylebone), Queen Charlotte's Lying-in Hospital (Marylebone), Queen's Square Hospital for the Paralysed and Epileptic, Royal Westminster and the Western Eye Hospitals, National Orthopædic for Deformities (Great Portland Street), Gordon Hospital for Fistula, Central London Throat and Ear Hospital, London Throat Hospital, Golden Square Throat Hospital, St. Peter's (Covent Garden) for Stone, St. John's (Leicester Square) and Stamford Street (Blackfriars) for Skin Disease.

In addition to the above are many nursing homes that receive paying patients only. [See *Lunatic Asylums.*]

HOUSE should be selected with reference to aspect, soil, site, drainage, ventilation, and lighting. A house with windows on the East and West has the best aspect,

as the early morning and late evening sun is thus caught and the intense sun of midday avoided. A gravel soil or chalk above the water level is the best. The nearness to neighbouring houses, stables, ponds or a stream likely to overflow its banks should be considered, as ample light, ventilation and absence of damp are important to health. Trees are desirable if not too near the house, as they aid in drying the soil; certain trees, e.g. eucalyptus, plane and poplar being specially useful. The drains are the commonest weak point and should be tested by the water test before they are considered beyond suspicion. The ventilation should be so arranged that every room ventilates into the outside air and not into a passage. [Refer to *Drains, Ventilation.*]

HOUSE-MAID'S KNEE is due to pressure and may be avoided by using a cushion to kneel on instead of the bare floor. [Refer to *Bursa.*]

HUNCHBACK. See *Spinal Disease.*

HUNGER. See *Appetite.*

HUNYADI-JANOS is a natural mineral water containing the sulphates of soda and magnesia and other salts. It is a valuable aperient, less nauseous than Epsom salts, though similar in action. The dose for an adult is a wine-glassful before breakfast.

HYDATIDS are cysts or bags of fluid caused by a parasitic worm, the Tænia echinococcus. The adult form of this worm lives in the intestine of the dog. If the eggs, which pass out with the fæces contaminate watercress or other article of human food, they gain entrance to the body and hatch. The embryoes thus set free are carried in the blood stream to the liver and at times to other parts and produce cysts in the organs attacked. Inflammation may be set up around these and symptoms may also be caused by the pressure they exert. In Iceland and Australia, where men and dogs live much together, the disease is very common though rare in England.

HYDROCEPHALUS is water on the brain, a common complication of meningitis. When sudden in onset it is usually fatal; but if the fluid accumulates only slowly within the brain, the skull and brain may be gradually expanded to accommodate it, and the patient may then live for some years and display fair intelligence. In one case the skull became so thin, owing to the pressure within it, that in strong sunlight it was transparent. The condition can sometimes be relieved by the surgeon.

HYDROCYANIC ACID or **PRUSSIC ACID.** See *Drugs, Poisons.*

HYDROPATHY is the treatment of disease by water used either internally or externally, or both. Many of the mineral waters owe their value largely to the water rather than to the mineral they contain, though the public are slow to take a course of exclusive water drinking unless the water is in a more or less offensive condition. Water increases the flow of sweat, urine, and bile, and thus promotes the removal of waste bodies, many of which if retained are poisonous. Under medical guidance for certain ailments hydropathy may be of value, especially in gout, kidney disease and sluggish liver. [See *Baths, Health Resorts.*]

HYDROPHOBIA, a disease transmitted to man by the bite of dogs suffering from rabies. Rabies has been stamped out by the Muzzling Act, coupled with quarantine of all imported dogs. Hydrophobia is thus extremely rare in England. Treatment can be obtained if necessary at the Pasteur Institute of Paris.

HYGIENE. a science which treats of the laws of health. [See *Air, Climate, Dead, Drains, Exercise, Fevers, Food, House, Public Health, Sewage, Ventilation, Water.*]

HYPERTROPHY denotes the enlargement of an organ beyond the normal limits. Hypertrophy is usually protective in its effect; thus if one kidney be destroyed by disease, the healthy kidney frequently undergoes hypertrophy, and is thus enabled to do as much work as that normally performed by both kidneys together.

HYPNOTICS are remedies which induce sleep. [Refer to *Sleeplessness.*]

HYPNOTISM, Mesmerism or Animal Magnetism is the name of a curious mental state, of which much has yet to be learnt, and which occurs in animals as well as men. It was shown as long ago as 1646, that if a hen is placed with its beak to the ground and a chalk line drawn from it, the hen remains motionless for a considerable time, though the slightest thing will disturb it. Many other examples of hypnotism have been discovered since, and the phenomenon of fascination by snakes is one of these. To produce the hypnotic state in man, the attention of the patient must be removed from all external objects and concentrated on the statements and wishes of the operator. So great may this concentration become that the patient only feels what the operator permits and only believes what the operator states. As a rule, however, hypnotism cannot be effected so thoroughly except by a long course of treatment. Such credulity is in reality only an exaggeration of the normal tendency to believe what one is told. Statistics point to the majority of mankind being susceptible to hypnotism; the most difficult to hypnotise being those who cannot concentrate their attention, viz., the imbecile, hysterical, and many of the insane. The time required varies from a few minutes to a few hours. The value of hypnotism in the treatment of disease is still uncertain. It is used by some physicians in treating dipsomania and morphinomania, hysteria, insanity, obstinate insomnia, neuralgia and epilepsy, but the results are often none too good. The danger of the treatment, however, is stated by many authorities to be nothing whatever, though it is alleged by others that the self-control may be weakened and such a condition as dipsomania thus made worse.

HYPOCHONDRIASIS, literally "below the ribs," refers to a state of melancholia, caused by some fancied bodily ailment. The sufferer himself is termed a "hypochondriac." [Refer to *Insanity.*]

HYPODERMIC SYRINGE is used to administer certain drugs under the skin, in order that by entering the circulation more quickly they may act sooner and also to prevent them from upsetting the digestion. Morphia, strychnine, cocaine, and ergotin are the most often given in this way. A slight mistake may give fatal results, hence self-administration or administration by any one but a doctor or hospital nurse acting under his order is to be condemned.

HYSTERIA is a condition in which ideas react on the bodily functions to their detriment. Young girls at puberty are most often attacked, but after a serious accident such as a railway collision it may attack adult men. The Latin races are more susceptible than the Anglo-Saxon. The condition is essentially one in which the emotional part of the mind is allowed to overbalance the will and the judgment. The effect on the body is often most curious; for instance, fits, paralysis, spasms, pain, hiccough, loss of voice, frequent cough, refusal of food, flatulence, scanty urine, symptoms of joint disease, rises of temperature, and very rapid or very slow pulse rate may each be due to hysteria. The affection may be guarded against by bringing up children healthily and properly, giving them abundant fresh air and food, avoiding overwork and teaching them self-control from infancy. The recognition of the above symptoms as hysterical and their proper treatment require medical skill, and so closely are real diseases often simulated that great discrimination is necessary.

ICE is frequently used as a means of applying cold for the relief of pain or the reduction of inflammation or the arrest of hæmorrhage. It may be broken into fragments by means of a needle and a hammer, and it lasts much longer if not allowed to stand in its own water. Ice bags may be extemporised by using mackintosh sponge bags. In applying them care must be taken that they are secured in the position the doctor orders. Ice should be used internally with great moderation or indigestion and depression of the heart result.

IDIOCY is defective development of the mind dating from birth. It varies in extent from an inability to attend even to the calls of nature, to mental deficiency sufficient to prevent speech being acquired. In the majority, prolonged treatment in institutions devoted to the purpose improves the condition. Bodily as well as mental defect is generally present.

IDIOSYNCRASY, literally "a peculiar constitution," denotes the exceptional susceptibility or immunity presented by certain individuals to various drugs, foods, or mental impressions. Thus the presence of a cat in the room induces an attack of asthma in some people, the sight of blood induces fainting, and in some cases even the sight of beetroot has a similar effect. Amongst foods, shell fish invariably cause nettle-rash in some people, and mushrooms completely upset the digestion of others. In administering medicine, the dose has often to be much altered to suit the idiosyncrasy of the patient; thus most children can take large doses of belladonna, but often not even the smallest dose of opium; many adults cannot take quinine without unpleasant symptoms arising, and so on, "One man's meat being another man's poison."

IMITATION or mimicry is a mode of learning, which is unconsciously but extensively employed, especially in early life. Hence the importance of the mother being as far as possible in close touch with her children, and of the nursemaids and others being carefully chosen. Certain epidemics of nervous disorder have arisen from time to time by mimicry and many cases of fits, hysteria, and St. Vitus's Dance are said to date from the sight of a similar case. [See *Epidemics.*]

IMMUNITY from infectious disease is either inherited or acquired. The man, who is in good health, inherits immunity from many but not all of the infectious diseases. From those to which he is susceptible he may acquire immunity by having the disease once, or by having it in a modified form through vaccination, or by the injection of a suitable antitoxin. [Refer to *Fever, Opsonin, Antitoxin, Vaccination.*]

IMPERIAL DRINK. This is an excellent drink in fever and in diseases of the kidney. To make it:—

> Add an ounce of cream of tartar to a quart of boiling water. Flavour with the juice of four and the peel of two lemons from which all the white has been removed. The mixture is then sweetened to taste. Allow to stand till cold and then strain.

INCONTINENCE of Urine. See *Bladder.*

INCUBATION. See *Fever.*

INDIGESTION or **DYSPEPSIA** is readily induced by unsuitable food, irregular or hurried meals, imperfect mastication or mental worry, over-eating or over-drinking. The *symptoms* vary in different cases, and include loss of appetite, nausea, vomiting, a feeling of weight after eating and pain. Pain is felt, in front, in the lower part of the chest; or at the back, in the left shoulder blade; and it is usually increased by food. There is often flatulence and the food "repeats," causing a bitter taste in the mouth, sore throat and cough. The mental effects of chronic dyspepsia are even worse: the mind is gloomy and apt to concentrate attention on the bodily symptoms, thus aggravating the condition. The *treatment* should be mainly preventive. Let the food be simply cooked and well served, varied and palatable; let the meals be eaten slowly and, if possible, amid pleasant companions. After the chief meal of the day, rest amid pleasant surroundings is highly beneficial; breakfast should be a substantial meal and eaten slowly, even though it may be necessary to rise somewhat earlier; luncheon for most busy people should be light. Between meals it is unwise to eat or drink, as the stomach requires rest like every other organ. The teeth must be seen to, regular exercise in the open air taken, worry avoided, the bowels kept regular. No fixed rules can be laid down in regard to the kind of food to be eaten. "One man's meat is another man's poison"; experience is the best guide. The articles most commonly found indigestible are pastry, pork, new potatoes, new bread, sauces made of melted butter, very hot or very cold dishes or drinks, and malted liquors. An occasional attack of indigestion requires a purge, a spare diet for a few days, and comparative rest. A special caution against alcohol must be given. The sinking feeling which dyspepsia often causes is responsible for the condition of many a hopeless drunkard, especially among women. They have seldom plunged into this condition, but have drifted into it, in the course of years, by steadily increasing doses of alcohol at gradually decreasing intervals. [See *Digestion, Flatulence, Constipation, Diarrhœa.*]

INEBRIETY. See *Alcoholism.*

INFANCY. The period which extends over the first two years of life. Upon the wise management of the infant depends its future health and well-being.

1. *The bath.* Before the first bath the infant should be anointed with vaseline and then lathered all over with curd soap, applied with a soft flannel. The vaseline will not be required after the first bath. In placing the child in the bath support it with the left hand and arm and keep the head well out. The bath must be comfortably warm. It is now to be sponged with a soft sponge, beginning with the head. It is next to be thoroughly dried with a warm soft towel; this is to be done by dabbing rather than rubbing. All parts likely to chafe are then dusted with violet powder. The nurse should wear a flannel apron whilst engaged in the above duties. After the first month the best nurse is the mother herself. The above mode of bathing should be repeated every night from the first day onwards without fail.

The navel-string should be dressed directly after the bath, every day until it drops off, which usually occurs from five to fourteen days after birth. A dusting powder is to be used consisting of starch powder 10 parts, boric powder 1½ parts and zinc oxide 1 part. This is better than the Fuller's earth so often used. The navel-string is first dried thoroughly with a soft towel, then dusted with the dusting powder and finally wrapped up in a square of clean muslin or linen rag with a hole in the centre. The navel-string is then turned up towards the child's head and secured there by a flannel binder. Burnt rag is not recommended and lint is to be avoided for this purpose because the nap sticks and causes trouble. If when the navel string comes away, the navel is sore, this requires dressing with zinc ointment spread on clean linen. *Bleeding* from the navel may occur shortly after birth. This requires the navel-string to be re-tied at once, a little nearer the body than the first ligature.

2. *Clothing.* The flannel binder, put on after the first bath, should be used for three months. If after this time a cough occurs or the navel is prominent, the binder must be resumed. The diapers used must be washed at home in the following way. They should be washed in primrose soap and well boiled; next they must be thoroughly rinsed, dried if possible in the open air, and then well mangled but not ironed. If sent to a laundry they run the risk of being soaked in soda, which renders them irritating to a baby's skin. In clothing children the legs and the stomach require well wrapping up, but the head should be clad lightly. The reckless exposure of the legs is one of the fashionable errors of the day. No pins should be used. A child should be "shortened" at two months old in summer and three months in winter.

3. *Feeding.* This should be always carried out on the breast if possible. The whole mental and bodily vigour of the future may be sacrificed by neglect to breast-feed the infant. The only exception to the mother undertaking this duty is when she is physically unfit from consumption or other cause stated by her doctor. When this is so, a wet nurse is much better than a feeding bottle. The infant should be put to the breast about three hours after birth, and two or three times a day until the milk begins to come freely. It is to be fed every two hours and on the breast alone, until it cuts some front teeth. This is to be expected about the sixth month. If the child is thriving it may continue to be mainly breast-fed until the end of the eighth month, after which it should be weaned. This must be done gradually in the course of a month. August and September should be avoided for fear of diarrhœa and the child should be fairly well when the weaning is begun. In the event of the mother not having sufficient milk to suckle the child completely she should supplement her own with cow's milk and barley water. The breasts should be used alternately; and after each feed both the nipple and the mouth of the child are to be carefully wiped. If this is neglected the nipple will crack and the child get thrush.

If brought up by hand, its diet should consist of cow's milk diluted with barley water for the first six months. No patent food, bread, biscuit, or other material whatever is to be allowed. Until the teeth are cut and the saliva appears, the child is incapable of digesting anything but milk. The dilution required varies from one tablespoonful of water to one of milk, to three of water to one of milk. The addition of a teaspoonful of fresh cream to each feed is desirable. The cream sold in brown jugs is unsuited to this purpose. The bottle used should be boat-shaped; those containing india-rubber tubes are to be shunned. It must be thoroughly cleaned between each feed by boiling. If soda water is used in cleaning it, care must be taken that no trace of this remains when the milk is added. The cow's milk used should be boiled or sterilised by heating to 180° F. for twenty minutes. The slightest suspicion of sourness of the milk renders it unfit for a baby's food. In such a case it is well to fall back on condensed milk, using a teaspoonful diluted with six tablespoonfuls of water. Regularity is just as important to the infant as the adult, to feed it every time it cries is to bribe it to cry, and not only that, but to upset its digestion and cause endless trouble. If crying, between the feeds, is persistent, give a little water, as thirst is at times the cause of the fretfulness. The appended table may be found useful.

Age.	Interval between meals by day.	Number of meals.		Average quantity of fluid given.
		By day.	By night.	
1st week	2 hours	6	4	2 tablespoons
2nd week to 2nd month	2 hours	6	2	3 to 4 tablespoons
2nd month to 4th month	2 to 3 hours	4	2	6 to 8 tablespoons
6th month	3 hours	4	2	12 tablespoons

It is a mistake to dilute milk with lime-water in order to make bone, for there is less lime in lime-water than milk. Barley water forms the best diluent as a rule, though lime-water may be used if diarrhœa is present. The food must be given at blood heat, and the child should be encouraged to suck slowly and steadily; it is on no account to be left to suck an empty bottle, as the air thus swallowed will cause indigestion. If the child sucks badly it may be because it has thrush, is tongue-tied or has a cleft palate; but it may arise from the holes in the teat of the bottle not being large enough; this should always receive attention first. After the teeth begin to appear in the sixth or seventh month it is time to add starchy food to the diet, although milk is still the chief food. It is well to begin by adding one of the partially digested starchy foods, marked B in the table below, to the milk, and when this is well borne to pass on to rusks, biscuits, or one of the foods marked C. It is well to add these foods to alternate feeds and in only small quantities at a time. After the tenth month the child may take potatoes and gravy and it is ready for meat when the double teeth are cut about the eighteenth month. In the classified list of patent foods it will be seen that only group A ought to be diluted with water, as both B and C consist of starchy food and therefore must be diluted with milk if the necessary fat and proteid are to be given. Much harm is caused by ignorance in this matter. Many buy some food or other consisting mainly of starch, and by shaking this up with water they obtain a white mixture not unlike milk in appearance, though in reality only water and starch. On this they feed or rather starve their infant, perhaps only a few weeks old, under the impression that the food is desiccated milk.

For the information given below on the chief patent infant foods we are indebted to Dr. R. Hutchison's book on "Food and the Principles of Dietetics." *Condensed* milks are cow's milk boiled down, with the addition, in many brands, of cane sugar as a preservative. In some brands skimmed milk is used. All condensed milk is prepared with water for use, and the resulting mixture is often deficient in cream, especially when skimmed milk has been used, or when much cane sugar has been added, as greater dilution is then required to make it palatable. The cost of condensed milk is double that of fresh, and yet 500,000 cwt. are imported annually. Condensed milk has the advantage of greater digestibility in many cases. *Desiccated Milks* are condensed milks evaporated down still further. They are, as a rule, more deficient in cream, and in some brands starch has been added. The condensed unsweetened whole milk is thus the best form of preserved milk at present obtainable.

INFANTS' FOOD.

A. Preserved Milk (used diluted with water).		**B.** Flour partially digested artificially (used with milk), e.g. Mellin's, Benger's, Savory and Moore's, Allenbury No. 3.
Condensed.	Desiccated.	
1. Whole milk unsweetened, e.g. Ideal, First Swiss, Viking, & Hollandia brands.	1. Without starch and with the excess of casein removed, e.g. Allenbury No. 1.	**C.** Flour not digested though often baked (used with milk), e.g. Ridge's, Neave's, Chapman's Whole Flour, Frame Food.
2. Whole milk sweetened with cane-sugar, e.g., Nestlé, Rose, Milkmaid, Full weight and Anglo-Swiss brands.	2. With the addition of starch or malt, e.g. Allenbury No. 2, Horlick's Malted Milk, Carnrick's Soluble Food, and Nestlé's Milk Food.	
3. Skimmed milk not to be recommended.		

In the case of *invalid infants* humanised milk may be required, that is, milk so altered in composition as to exactly resemble the human composition. This can be obtained direct from the Aylesbury Dairy Company and Welford's. Ass's milk is more like human milk than any other, but it costs six shillings a day to feed an infant on it. A most valuable food is whey and cream. Curds and whey are made with milk and rennet in the ordinary way, and to the whey is added a teaspoonful of fresh cream for every two ounces of whey. Infants thrive on this mixture during the first six months, even when milk and barley water causes vomiting.

4. *Teething* often causes irritation of the gums. This may be reduced by allowing some hard body to be used, such as the india-rubber teething rings or the thumb. The latter is the natural teething ring. If sucking the thumb develops into a habit, this can readily be broken later by painting the thumb with aloes and water. If a gum is spongy and the tooth can be felt it may be wise to relieve tension by lancing the gum at this spot. "Teething Powders" often contain opium and other dangerous drugs, and must never be given without a doctor's orders. The results of careless feeding or dirty bottles cannot be explained away by the magical word "teething." It is probable that the well known red gum rash popularly attributed to teething is due to indigestion and lack of cleanliness.

5. *General Management.* In the management of an infant, a mother cannot attach too much importance to fresh air, exercise, and sleep. After the first few days the child should be taken out when the weather is fine. It is well to place the child on a thick rug on the floor daily and allow it to kick freely. It may also be danced up and down gently with advantage. Care must be taken not to let the child support its whole weight on its legs too soon. Sleep should be encouraged as much as possible, but not allowed while feeding. The *bowels* need special attention. The first few motions are dark olive green, afterwards they should become a bright orange yellow. The presence of a green colour, of curds, of slime, or of blood is a sign of something wrong. After an action of the bowels, the diaper should be changed without delay, oatmeal water,

not soap, being used for cleansing the child. Sore buttocks are best avoided by attention to these details. When present, a mixture of vaseline and Fuller's earth should be applied. Skin eruptions are best avoided by the daily bath. *Gripes* and *wind* require a simple aperient, e.g. castor-oil or fluid magnesia, and a restriction of the diet. A baby weighs from six to eight pounds at birth. For the first three days it loses weight, but regains this by the end of a week. After this it should gain about an ounce a day for the first five months. As a rule it is ready for *vaccination* between the age of four and six weeks. [Refer also to *Thrush, Rupture, Rickets, Night Terrors, Convulsions.*]

INFECTION. See *Bacteria, Disinfection, Fevers.*

INFLAMMATION is the name of a series of changes set up by an irritant acting on living matter. The purpose served by these changes is the removal of the irritant and the repair of the injury. In the lowest and simplest forms of life the irritant is attacked by the whole organism, but in the higher forms certain portions of the organism are specialised for the duty of defence, and these alone take part in the process. The chief agents of defence in the higher animals are the leucocytes, or white blood corpuscles which are present in both blood and lymph. When any irritant attacks any spot of the body, the neighbouring leucocytes are attracted and surround the irritant. They then pour out fluid, which kills the irritant if living, and may even enclose and digest the irritant. In animals without highly organised circulation, the defence falls mainly on the leucocytes in the immediate neighbourhood, but in those with elaborate circulatory organs the blood supply to the irritated spot is at once increased; hence the part becomes hot, red, and swollen, and the leucocytes, thus brought, leave the blood-vessels and attack the irritant. If they succeed in removing the irritant the leucocytes pass away in the lymph, the outpouring of fresh leucocytes ceases, and the blood supply to the part is reduced to the normal. The inflammation is then said to quiet down, the redness, heat, swelling and the pain, which the swelling causes, disappear, and the normal condition is resumed. If, on the other hand, the leucocytes are themselves destroyed by the irritant, more leucocytes are brought to the spot, which add their members to those already present, just in the same way as reserves are ordered up when, during a battle, there is risk of defeat. The dead leucocytes are the pus or matter, which continues to accumulate until the living leucocytes, continually brought to the spot, succeed in destroying the irritant. Inflammation is most likely to be accompanied by the formation of matter when the irritant is a living body capable of rapid multiplication. Such is the case when bacteria or germs are the irritant. The *treatment* is to give the inflamed part rest, and to support the general health by nourishing diet, by attention to the bowels, and by securing sleep. When inflammation is slight and unlikely to end in the formation of matter, the application of cold to the affected spot is good treatment. Cold may be applied by the use of evaporating lotions on a bandage or by an icebag. When the formation of matter threatens, heat is much better than cold, applied as fomentations, poultices, or as Japanese muff-warmers. When matter has formed it should be let out at once by the surgeon's knife, even though it be deeply placed, when an anæsthetic may be required. Chronic inflammation is best treated by rest and a counter irritant over the affected part, applied as a blister or with the cautery. The application of continued slight pressure by strapping suits some cases and massage others.

INFLUENZA is an infectious fever due to a germ—the *bacillus influenzæ*. Infection is conveyed in the air and also by direct contact between the sick and the healthy. The incubation period is two or three days. The *symptoms* begin suddenly with a rise of temperature to 103° or more, prostration, and pain in the back and head. After the onset the symptoms differ in different epidemics. In some the chief symptoms are bronchitis, with running at the eyes and nose, in others vomiting and diarrhœa, and in yet others severe headache, sleeplessness, and delirium. The duration of the attack is short unless complications occur, of which pneumonia is the most serious. Owing to the severe prostration, convalescence takes longer than in most fevers, and other diseases are apt to begin at this time, especially consumption. As to the *treatment* required: The patient should be isolated and put to bed. The diet, which should be nourishing and easily digestible, is best given every two hours by day and every four hours by night. If vomiting is severe, peptonised food may be necessary. Until the temperature is normal the patient should be confined to bed. This point is of more importance than is popularly thought, many of the serious after-effects of influenza being due to neglect of this simple precaution. The medicine used should be a mixture of acetate of ammonia, citrate of potash and similar drugs that promote the gentle action of the skin and kidneys; and after the fever is over a tonic is required. A good seaside holiday before work is resumed is strongly recommended.

INFUSION is made by pouring boiling water over some body and allowing it to stand and then straining. Tea is an infusion. The Pharmacopœia contains twenty-one infusions. They do not keep well.

INGROWING TOE-NAIL is the injury of the flesh by the edges of the nail. It is caused by the pressure of ill-fitting boots and by the habitual cutting of the nails in the wrong way. Nails should be cut square, the sides should not be pared, or the cut edges may sink into the flesh and start ingrowing toe-nail. When this occurs a surgeon should be consulted.

INHALATIONS are remedies administered in the form of vapour. They are chiefly used to act on the air passages. Some relief for a cold in the head, or for laryngitis, may be obtained if half an ounce of Friar's balsam with half a teaspoonful of oil of eucalyptus are added to a quart of boiling water and the steam inhaled for twenty minutes every three hours.

INHERITANCE. See *Heredity.* **INJECTION.** See *Enema.*

INOCULATION is the introduction of contagious matter by applying it to scratches made in the skin. Before the days of vaccination small pox was frequently inoculated in order to induce a mild attack of this disease, and thus provide immunity for the rest of the patient's life. The practice has been prohibited by law because it frequently gave rise to serious epidemics of small pox in the neighbourhood.

INSANITY is connected with sanity by many forms of mind lacking in balance. For practical purposes a man is usually regarded as insane only when the unsoundness of his mind prevents him from managing himself or his affairs, or causes him to be a source of danger to others. The test applied is thus one of conduct, not of beliefs, however much the latter may differ from those usually held. Abnormal conduct, however, may be due to vice or crime and not to insanity. By vice is meant self-indulgence at the cost of harm to self. By crime self-indulgence at the cost of harm to others. According to Mercier, insane conduct differs from vice or crime amongst the sane in the relationship of the self-gratification obtained to the punishment incurred. In insanity, self-indulgence is carried to such an extent that the present is everything, the future, even the morrow, is nothing. Whereas in vice or crime amongst the sane the gratification at the moment bears some proportion to the risk of punishment incurred, and especially to the remoteness or proximity of the punishment. The sane will incur severe punishment, if sufficiently remote, in order to obtain self-gratification for the moment, but a slight punishment, if certain and immediate, has a deterrent effect, which it has not on the insane. Thus theft carefully performed so as to avoid detection points to sanity, but theft immediately under a policeman's eye, with no effort at concealment, points to insanity. Occasional drunkenness is vice without suggesting insanity, but drunkenness to the extent of deliberately drinking to death in a few weeks, points to insanity; for the punishment follows the self-gratification so quickly, and is also so heavy, that there is no rational relation between them.

Different forms of unsoundness of mind are recognised. Defective mental development from birth gives rise to the *idiot*, if speech is not acquired, or to the *imbecile* if it is. Many imbeciles are highly intellectual in one narrow sphere of knowledge and quite lacking in the simplest matters outside these limits. *Lunacy*, or Insanity proper, is unsoundness of mind occurring in one whose mind has fully developed before becoming disordered.

Of the different varieties the chief are :—

1. *Mania*, exaltation with derangement of the reasoning power.
2. *Monomania*, disturbance of the mental balance in one direction only, of which kleptomania, dipsomania, and many other forms are recognised.
3. *Melancholia*, or great despondency, which has two chief subdivisions—despondency due to some fancied trouble in connection with money, love, or religious matters; and despondency due to some fancied bodily ailment (the latter variety is termed "hypochondriasis").
4. *Dementia*, or Progressive loss of mind, which comes on either independently or more often follows (1) or (3). Such a condition when advanced closely resembles that of the idiot or imbecile. The onset is usually with loss of memory, proper names being forgotten before common nouns, nouns before adjectives, verbs and interjections being the last to be retained. Next reasoning power, then ability to comprehend, and lastly the will is affected until finally hunger, cold, and the calls of nature excite but little if any attention.

Not infrequently mania and melancholia alternate. The two conditions are in many ways the exact opposite. The maniac is keenly alive to every passing event, which directs his thoughts this way and that, and renders the train of thought very similar to a series of nightmares. The melancholic is so concentrated on his own misery that he can think of nothing else. He is oblivious to his surroundings, and may sit in one attitude for hours apparently hearing and seeing nothing and refusing food. Such a condition has been mistaken for a trance.

Many lunatics suffer from hallucinations, illusions and delusions. An *hallucination* is a mental image perceived as an object which has no real existence in space. Examples are the hearing of imaginary voices and the seeing of imaginary rats. *Illusions* are erroneous perceptions derived from real objects. An example is seeing a stranger and mistaking him for a near relative. *Delusions* are false beliefs which arise either from reasoning correctly from hallucinations or illusions, or more rarely arise by correct perceptions but false reasoning. A lunatic, for instance, every night hears an imaginary voice telling him that he is commanded to sacrifice his children. For some time he probably resists and doubts if the voice is not the result of fancy; gradually its nightly recurrence, with increasing distinctness, convinces him it is an angel's voice; and a delusion thus arises, which may be the cause of homicide or of suicide to escape the command. Or a melancholic, astonished at his own misery, sets to work to consider why he is so miserable and builds up various theories to explain it, e.g., he is being secretly attacked by enemies undermining his health with wireless telegraphy, mesmerism or some other occult agent, usually the one most spoken of at the time. Or he concludes that his misery is due to religious causes, that perchance he has committed the unpardonable sin. The point we wish to emphasise is that the lunatic has not lost his reason, but on the contrary often uses it to excess, beginning with errors of perception or abnormal feelings, and from them building up delusions, which no argument shakes. As dementia develops, the hallucinations and delusions gradually fade and much anguish is thus relieved.

The *detection* of insanity is much more difficult than is commonly thought, the mono-maniacs being probably the most difficult. In this class the dipsomaniac, who at intervals is afflicted by a morbid craving for alcohol or some drug, but who is otherwise sane, is well known; but the variety known as moral insanity is less familiar. In this condition the intellect and the lower emotions are normal, but the sense of right and wrong is undeveloped, and no education succeeds in developing it. From childhood, lying, theft, and purposeless cruelty are frequently committed, and in adult life murder or other grave crime brings the perpetrator to the dock. It has then to be determined whether the man is a criminal or whether his case is one of moral insanity. The past history is the chief evidence used in determining this point. The murderer of Terriss the actor was diagnosed as a case of moral insanity, and it has to be considered whether many habitual criminals are not, at least in part, cases of moral insanity, that is to say, with moral faculties dwarfed, if not absent. If so, prolonged treatment in the criminal asylum is required instead of repeated short terms of punishment in prison. At present, however, only the most obvious cases of moral insanity are diagnosed as such, those affected by the slighter forms of the malady being treated as sane and wholly responsible for their actions.

Causes of Insanity: Disease of the brain, so far as present-day methods of examination can go, is not always found at the post-mortem examination, though certain forms of lunacy, like "general paralysis of the insane," are always associated with it. It is found that insanity increases as civilisation advances, and such an increase is going on now in England, though probably not to such an alarming extent as the statistics suggest. Heredity of the tendency to become insane is present in about one-third of the cases. Chronic blood-poisoning is responsible for a large number; the chief poisons being alcohol and syphilis. Mental strain from overwork, worry, or sudden loss of fortune, reputation or a near relative, is a potent cause. Injury to the brain by blows on the head, or by repeated epileptic fits, causes a minority of the cases. Insanity is prone to show itself at certain periods of life e.g., puberty, pregnancy, childbirth, change of life, and old age. The prospect of recovery is least hopeful when insanity begins in youth; it is most hopeful when the attack has arisen from childbirth, or the change of life, or as the result of a fever. The treatment is best in the hands of trained attendants such as the asylums provide. The relatives will be wise to remember that a lunatic should never be deceived, for the power to control him will be thereby much weakened.

The *Lunacy Law* permits any person, over twenty-one, having an interest in the case, but preferably a near relative, to sign an order for the admission of a lunatic to an asylum, such person being liable to damages if there prove to have been no sufficient ground for the order. Such an order must be accompanied by one medical certificate, which states that the alleged lunatic is insane and requires immediate removal. This order is known as the "Urgency Order," and must be replaced within seven days by a "Reception Order." The poor will find the relieving officer their best friend in the circumstances, for he will arrange the necessary formalities. When there is no need for immediate removal, a petition from a near relative, accompanied by two medical certificates, has to be sent to a magistrate of the district, who may grant the petition either with or without an interview with the alleged lunatic. The patient is then removed on a "Reception Order," which has to be renewed if detention is still required, after a year and a day. A lunatic under certain conditions can make a valid will. He must be able to recall the nature and extent of his property, and also the persons who have claims on his bounty, and his wishes must not be influenced at the time by any person or by an insane delusion. A doctor should be engaged to examine and certify to his ability to make a will, and the will should be made in the presence of the doctor and some disinterested person.

INSOMNIA. See *Sleeplessness.*

INTEMPERANCE. See *Alcoholism.*

INTER-MARRIAGE tends to perpetuate any peculiarity, whether advantageous or the reverse, that either parent possesses. Hence marriage between cousins is unwise if either of them has inherited a tendency to consumption, insanity, or other disease.

INTERMITTENT FEVER. See *Ague.*

INTESTINE. See *Alimentary Canal.*

INUNCTION is the introduction of drugs or food by rubbing them into the skin. The unbroken skin has

a slight absorptive power. Wasted infants, who cannot keep food down, are at times kept alive by rubbing cod liver oil into the skin thrice daily, and by wrapping them in flannel soaked in oil. Mercury also is sometimes administered by inunction.

IODINE is used externally as a counter-irritant in the form of tincture of iodine, but it is not to be recommended for domestic use. If swallowed, it acts as an irritant poison, and must, therefore, always be kept in a proper poison bottle and under lock and key. Iodine stains the skin brown and stains starch blue. It is thus useful to detect starch when present as an adulteration in bread for diabetics, and other preparations supposed to be free of starch.

IPECACUANHA is a drug much used to loosen a tight cough. Dover's powder is a preparation often used, containing opium as well as ipecacuanha. The dose of this powder for an adult is ten grains, and one dose may be taken at night at the onset of a cold in the head or on the chest, but must never be given to children. Ipecacuanha wine contains no opium, and may be given at any age. The usual dose for an adult is ten drops in a little water every four hours; and for an infant three drops in a teaspoonful of water every three hours. One tablespoonful of the wine for a child and two for an adult is an emetic which acts about twenty minutes after it is taken, and is thus not sufficiently prompt in cases of poisoning, though useful to empty an overloaded stomach after an indigestible meal.

IRIS, the coloured part of the eye. See *Eye*.

IRON is the most valuable drug we possess for the treatment of anæmia, but it requires considerable skill to so administer this drug that the anæmia is cured without the production of dyspepsia, headache, and other unpleasant effects. Iron should, therefore, always be taken under medical supervision. As iron blackens the teeth, fluid preparations of iron are best taken through a quill. Though perchloride of iron stops bleeding when applied to a wound, it is an undesirable application, as it makes the wound slow in healing, and leaves a considerable scar.

IRRITABILITY is a symptom of defective self-control, and may be expected in those convalescent from an acute illness, or the victims of an exhausting chronic one, as well as in those mentally defective or liable to fits. Persons in health, as fatigue develops, find the temper becomes shorter from the same deficiency of control. Pain, lack of sleep, worry, or chronic blood-poisoning arising from lack of exercise, over-eating, constipation, gout, Bright's disease, with other causes besides, are all likely to produce irritability. The treatment is the removal of the cause, if possible, and in any case the reduction of all sources of annoyance.

IRRITANT POISONS. See *Poisons*.

ISINGLASS is gelatine prepared from the air bladders of certain fish. Though more expensive than calves' foot gelatine, it is doubtful if it is of greater nutritive value.

ISOLATION. See *Sick Room, Fevers*.

ISSUE is a sore artificially produced and prevented from healing. Though formerly much in vogue as a means of applying counter-irritation over an inflamed organ, an issue is now very seldom employed.

ITCH, or Scabies, is a contagious disease due to a parasite, a spider or mite, the female of which burrows in the skin and causes great irritation. The female selects the thinnest skin obtainable to burrow in. In the adult, this is between the fingers and toes, at the wrists and round the navel; but in the infant the skin is everywhere sufficiently thin, and the above distribution is not present. Marks due to scratching are usually wide-spread, most of the eruption being due to this cause rather than to the burrowing of the parasite. The treatment consists in the destruction of the parasite both in the skin and the clothing. The clothing requires baking. The patient is treated by scrubbing with soft soap and nail brush so as to open up the burrows and expose the parasite. Sulphur soap is then used freely. Pulling tow to and fro between the closed fingers is also a good method of opening the burrows. After the bath the patient puts on disinfected clothing, and he repeats the treatment every other night for three times. He is then free of the parasites, unless he becomes reinfected from other members of his family, all of whom should be treated at the same time. Instead of sulphur soap, a sulphur bath (see *Baths*) may be given, and sulphur ointment rubbed in afterwards. He should not continue the sulphur treatment too long, or irritation of the skin will be caused, which he is apt to mistake for proof that the parasite is not yet destroyed. Indeed, calamine lotion is often required to soothe the skin after a short course of sulphur treatment. Less irritating, though more expensive than sulphur ointment, is naphthol, a drachm of which should be made up with an ounce of lard and about a drachm of precipitated chalk.

ITCHING is technically called *pruritus*. It may occur on the skin or at the anus. Itching of the anus may result from constipation, piles, or gout. It is best treated by removing the cause and by the local application of zinc ointment or hazeline cream. Confection of pepper by the mouth may be tried also. Itching of the skin results from many causes, such as rough flannel next the skin, sweat, dirt, parasites, eczema and other skin diseases. The cause must be detected and removed. The skin can be soothed by lead lotion and by a drachm of creolin to the pint of water applied as a lotion. Scratching must be avoided as much as possible. Pressure applied to the skin relieves irritation quite as well and does no harm. The nails should be cut short and the hands enclosed in fingerless gloves or socks at night, to prevent scratching during sleep.

IZAL is one of the modern disinfectants. A solution of one in two hundred of water is a powerful and safe preparation.

JALAP is a drastic purgative, too strong for domestic use.

JAUNDICE, or staining of the skin by bile, is a symptom of obstruction in either the main bile duct or its finer branches. The effect of such obstruction is to prevent or hinder the outflow of bile from the liver, and this pent-up bile is then removed by absorption into the circulation. From the blood the bile is discharged in the urine, saliva and sweat, and it is also deposited in the skin and other parts of the body. The whites of the eyes are tinged early in the attack, though the interior of the eye is affected very late, if ever. Putting on one side many rare cases of jaundice, we may say that jaundice is common shortly after birth, and clears up in a few days without treatment; that in youth jaundice is due to indigestion, which causes swelling, and therefore obstruction at the mouth of the bile duct, where it opens into the small intestine; that in middle age, especially in women who suffer from corpulence, jaundice is most often due to gall stones; and that in old age, especially when accompanied by wasting and dropsy, jaundice is usually due to cancer of the pancreas or liver. The effect of bile circulating in the blood is not often very great, though the skin usually itches and the spirits are depressed. The *treatment* of jaundice in youth is a light diet, a course of laxatives, avoidance of chill, and mental rest. The attack usually lasts from a fortnight to six weeks. Jaundice due to gall stones requires similar treatment, but gall-stone colic, so often present in these cases, requires the treatment given under *Colic*. Removal of the stones by operation may be advisable when the jaundice is prolonged for some months or is frequently recurring with attacks of colic. *Itching* of the skin may be relieved by lead lotion, creolin lotion one drachm to the pint, or bicarbonate of soda solution, one drachm to the pint.

JAW, dislocated or fractured. See *First Aid*.

JELLY is often required for sick cookery. Isinglass is a specially pure form, but dried gelatine, e.g. Cox's, or "Calves-foot jelly" may be used if necessary. Milk, egg, lemon and wine jellies are all used. *Grape Jelly* is much appreciated and may be made as follows:—

1¼ lbs. of rather sour but juicy white grapes are pounded in a mortar or mashed with the aid of a wooden

spoon and steel fork, and strained, and the juice boiled in a saucepan; ½ oz. of Cox's or Nelaton's gelatine, previously soaked for two or three hours in enough water to cover it, is then added, and the whole is then strained through muslin previously soaked in hot water, and allowed to stand. In warm weather 1 oz. of gelatine will be required to make it set.

JELLY FISH STINGS may be received while bathing. The application of dilute ammonia is the best treatment.

JEYES' FLUID is a strong disinfectant containing a chemical allied to carbolic acid.

JIGGER WORM is a burrowing flea found in the West Indies and South America. It most often attacks the feet, and the natives acquire skill in extracting it with a needle, The best preventive is anointing the feet with eucalyptus oil and keeping them covered.

JOINTS are the junctions of two or more bones. In some the junction is effected by the one bone fitting immovably into the other, as in the skull. In others a layer of gristle intervenes, as in the joint between one vertebra and the next. In yet others free movement is permitted, the bones being only united by ligaments and muscles. The ball and socket joint like the shoulder, the hinge joint like the knee, and the pivot joint like that of the atlas on the axis, are examples of joints permitting free movement in one or more directions. The friction such movement causes is reduced by the secretion within the joint of a special lubricating fluid known as the synovial fluid, and also by the ends of the bones being covered with smooth gristle or cartilage; whilst in certain places special extra pads of gristle are so placed as to form buffers between the bones and thus lessen concussion. These pads at times may become detached, and being then loose in the joint they become nipped between the bones. Such an accident causes great pain with defective movement of the joint. It is most common in the knee-joint, and forms the most common accident on the football field.

The chief diseases from which joints suffer are inflammation caused by injury, gout, rheumatism, rheumatoid arthritis, dysentery, gonorrhœa and tuberculosis. Inflammation is accompanied by swelling due largely to an excess of synovial fluid, but after a wound the swelling may be due to matter.

The chronic inflammation of the joint caused by tuberculosis produces "white swelling," owing to the disorganisation of the interior of the joint by the growth of new tissue. Later, this tissue, which is deficient in blood-vessels, breaks down into dead liquid material like matter.

The *treatment* of joint disease varies with the cause. An acute injury or inflammation requires absolute rest, but gentle movement must not be delayed too long or stiffness results. Chronic joint trouble may require prolonged rest, as in tuberculosis, but more often hot bath treatment, followed by massage, such as Bath, Buxton, Droitwich and many of the Continental Spas provide, are the most suitable. The local application of heat may also be effected by bags of sand or salt heated in the oven, and of recent years the "Dowsing System" has come to the front. In this mode of treatment the joint is enclosed in a metal case containing a large number of electric lamps, the heat and light from which act on the joint. Stiffness of the joints, owing to the formation of adhesions within them, is a common result of chronic inflammation. If movement cannot be regained by hot baths and massage, it may be necessary forcibly to bend the joint under an anæsthetic, and to apply movement and massage subsequently. In tuberculosis arrest of the disease, with a stiff joint, is often the best result that can be hoped for; hence the indiscriminate bending of all stiff joints is fraught with danger. The "bone-setter" is in the habit of stating that all joints shown to him are "out," and he then treats them by forcible and sudden bending. Adhesions are thus broken down and movement re-established. By breaking the crutches he insures the movement being continued. In certain cases he thus achieves a great reputation, at the cost of infinite harm to those in whom such violent treatment is the exact opposite of that which is required.

JUGULAR VEIN. There are two veins, the internal or deep and important vein, and the external or small vein just beneath the skin. Hence, when it is stated that in an attempted suicide the jugular vein was severed, often only the external jugular was in reality wounded. Both veins return blood from the head to the great veins at the root of the neck.

JUNIPER contains an ingredient which has a powerful diuretic action. Gin, which is prepared with juniper berries, contains this ingredient. Either spirits of juniper or gin are frequently taken by the public when they imagine their renal organs are deranged. If renal mischief is really present, however, juniper and gin make matters worse.

JUNKET. See *Milk*.

KETTLE. A steam kettle is provided with a long spout so as to discharge the steam well into the room. In cases of bronchitis or cold on the chest, a steam kettle will be found valuable in the sick room. If the kettle be placed near the bed and heated by a spirit lamp it acts with greater effect, but care is of course required to prevent scalding, especially in the case of children, who are often restless when suffering from bronchitis, and are apt to sit up suddenly.

KIDNEYS, THE. Each kidney is placed in the loin close to the back-bone. Above, it is in contact with the diaphragm; on the outer side, it is crossed by the two lowest ribs which protect it; and its lower border is just above the navel. Behind, it is separated from the skin by the muscles of the back, and it is further protected by lying in a mass of fat and a fibrous capsule. To the inner border the ureter, the renal artery, renal vein and nerves are attached. The ureter, a kind of pipe, drains off the urine, which the kidney produces, and pours it into the bladder. The kidney serves a double purpose:—(1) to remove waste matter from the blood and discharge this in the form of urine, and (2) to pour into the blood a secretion, which regulates nutrition, and in default of which rapid wasting occurs. The latter function has been discovered recently by Rose Bradford. At times the two kidneys are fused into one *horse-shoe* shaped kidney, and at times only one kidney is present from birth.

Normally the kidney is so fixed that only a slight ascent and descent occurs with each breath; but often the fibrous capsule, enclosing both the kidney and the fat round it and anchoring the kidney to the back-bone, becomes slack, and then the kidney falls by its own weight until checked at the cost of severe pain, by the blood-vessels and nerves connected with it. Such a condition is termed *movable kidney* and may be brought on by tight lacing or child-birth. The symptoms caused are in slight cases unobserved, but in more severe cases they are pain in the loin with dyspepsia; and at times, when the ureter becomes kinked, pain, vomiting, fever and collapse occur. The flow of water is then checked until the attack ends by the passage of an unusual amount due to the ureter becoming unkinked. A suitable belt should be worn, and if this fails, an attempt to sew the kidney to the abdominal wall is the treatment usually adopted. The disease is not uncommon in women.

Inflammation of the kidney is treated under "Bright's disease." *Stone* may form in the substance of the kidney, uric acid or oxalate being the most common form. If the stone does not move it may cause no symptoms, but movement causes severe pain in the back, usually on the same side, and blood in the urine. If the stone enters the ureter, unless very small, it will only pass with difficulty, and its passage will be accompanied by renal colic. *Renal colic* is sudden in its onset, usually lasts some hours, and ends as suddenly as it began. The symptoms are paroxysmal pain shooting down into the groin and thigh, frequent passage of a few drops of blood-stained urine, vomiting, sweating, coldness of the extremities and shivering. The treatment of renal colic should be warm drinks and a hot bath, and if ordered by the doctor, a hypodermic injection of morphia.

Kidney *tumours* may be due to obstruction of the ureter and the consequent retention of the urine in the

kidney. Such a tumour is termed a hydronephrosis. Inflammation of the pelvic organs after childbirth is a common cause of this malady. Tumours may also be due to tuberculosis or to cancer. *Rupture* of the kidney occurs in railway-buffer accidents, but seldom in other accidents. Complete rest till medical aid is obtained is the only treatment. Disease of both kidneys, whatever its nature, if sufficient to prevent the waste products in the blood from being removed, produces a form of blood-poisoning known as *uræmia*. The patient passes into a drowsy state in which often occurs some delirium with cramps or convulsions. The face is sallow, the pupils contracted; vomiting and headache are common; the tongue is dry and brown, the breathing is often irregular and attended with hissing. The drowsiness deepens and death as a rule supervenes. The treatment is to promote the removal of the poisons by the skin and the bowels. Copious draughts of warm drinks, hot baths and hot packs, and free purging are recommended. [See *Baths*]. [Refer also to *Bright's, Colic, Gravel, Urine.*]

KING'S EVIL is an old name for Scrofula, a form of tuberculosis, which it was supposed a king could cure with a touch.

KNEE, a hinge joint, permitting flexion and extension with very slight rotation. Dislocation is very rare, but displacement of the internal semilunar fibro-cartilage is a common accident on the foot-ball field. The cartilage is a pad of gristle placed at the margin of the joint to lessen concussion. When torn from its attachments it lies loose in the joint, and then is apt to be nipped between the bones, thus limiting movement and giving rise to severe sudden pain. The knee is fixed in a bent position. It should be bent up still more and then suddenly straightened, whilst the patient either holds the limb as loosely as possible or has his attention diverted. In the act of straightening, the cartilage is forced back into its normal position. The joint may subsequently swell, a condition termed synovitis or water on the knee being set up, and will in any case require rest. A special knee splint is sold that permits the normal flexion and extension, but prevents any rotation and thus guards against a recurrence of the accident. The knee may be attacked by rheumatism, rheumatoid arthritis or gout, and in childhood is liable to tuberculosis, a chronic disease characterised by pain, limitation of movement, and swelling without redness of the skin. Hence the condition is known as "white swelling." Medical aid should be sought early. [Refer to *House-maid's Knee.*]

KNEE-CAP or *Patella*, is the disc of bone placed in front of the knee-joint. Above it is attached to the muscles of the front of the thigh, and below by a tendon to the upper end of the shin-bone. Normally it moves over the joint whenever the muscles of the thigh by pulling on it move the shin-bone and so straighten the leg. Abnormally it may snap across owing to the muscular pull from above, and to the leg being so fixed that it cannot straighten. Such a condition is termed *fractured patella*, and is one of the accidents popularly called "putting the knee out." It is very rare for the knee-cap to be broken by blows applied directly to it. The fracture is readily recognised, for the upper fragment is drawn up and a gap left between it and the lower one. The joint is rapidly distended with blood. A piece of board should be fixed to the back of the limb by handkerchiefs, placed at the ankle, just above and just below the knee and near the top of the thigh. The two lower limbs should then be fastened together, and the patient taken home, a bag of ice, if possible, being placed over the swollen knee. A doctor of course should be immediately sent for.

KOUMISS is fermented milk. It was first made in Tartary from mare's milk. It is now supplied, made from cow's milk, by the "Aylesbury Dairy Company," "Welford's Dairy Company," and others. It is at times better borne by the stomach than any other form of milk-food and is therefore of value in the treatment of obstinate vomiting.

LABURNUM. The seeds are poisonous to children. Treatment is that for Belladonna. [Refer to *Poisons.*]

LACTIC ACID is a colourless liquid of acid properties. It is produced when milk turns sour, and also when the food ferments in the stomach, in cases of flatulent dyspepsia, giving rise by its irritating properties to heart-burn. Hence the value of a dose of bicarbonate of soda in heart-burn, for it neutralises the lactic acid.

LAMELLA is a small disc composed of gelatine and glycerine, and containing a dose of some drug, which it is intended to insert between the lower eyelid and the eye. The Cocaine lamellæ of the British Pharmacopœia are valuable for relieving pain when splinters of emery or steel have become embedded in the eyeball. Such an accident is only too common in many factories, and it is a good plan to insert one of the lamellæ, together with a drop of castor oil, into the eye before sending the sufferer to a doctor.

LANGUOR. See *Debility.*

LANOLINE is composed of pure wool fat and water. It is one of the best ointments that can be used for softening rough dry skin, such as that of chapped hands.

LARYNGITIS is inflammation of the larynx. The chief causes are catarrh due to cold, diphtheria, tuberculosis and syphilis. The *symptoms* are huskiness or loss of voice, dry cough and some difficulty in breathing, which may at intervals be very great. The *treatment* is to give the inflamed organ rest by avoiding speaking above a whisper. The air breathed should be moist and warm, and hot flannels should be applied to the throat. When the laryngitis is part of a general disease, e.g. diphtheria, the treatment will be directed mainly to the latter.

LARYNGOSCOPE is the apparatus used for looking at the larynx. A light is placed by the patient's ear, a mirror is fixed to the doctor's forehead, and the light is reflected into the patient's mouth, whence a small mirror on a long handle directs it to the larynx, which is situated behind and below the tongue.

LARYNX is the upper end of the wind-pipe, specially adapted to act as a guard to the entrance and also to produce the voice. On each side is a fold like a watch pocket, in the free border of which is an elastic cord termed the vocal cord. The two vocal cords can be brought in contact so as to close the wind-pipe, or can be widely separated so as to admit air freely. With each breath the cords are separated, and they are allowed to come together partially between each breath. In speaking or singing the cords are brought close together and made to vibrate by the stream of air forced on to them from below. In coughing the cords are brought firmly together and the wind-pipe closed until the pressure within the chest has been sufficiently raised to overcome the resistance that the cords offer. The cords are then forced apart, and the air in escaping produces the noise of coughing. The walls of the larynx are composed of two rings of gristle, similar to those of the windpipe, but much larger. Whilst the lower of the two is complete, all the other rings of the wind-pipe are open at the back. A lid or epiglottis guards the entrance to the larynx from above.

LAUDANUM is Tincture of Opium; Dose for an adult is 5–15 minims for repeated administration and 15–30 minims for a single dose. [Refer to *Opium.*]

LAUGHING GAS is nitrous oxide, a valuable anæsthetic for minor operations of short duration. The name is due to the hysterical symptoms formerly often produced by its administration. When given properly, however, such symptoms are rare.

LAXATIVE. See *Constipation.*

LEAD POISONING is of frequent occurrence amongst workers in white or red lead and also in metallic lead [see *Dangerous Trades*]. Lead has been known to contaminate drinking water, aerated waters, food wrapped in tin foil, and cider or beer that has been allowed to stand in lead pipes. Lead salts have caused poisons by their presence in drinking water (owing to red lead used in jointing the pipes), as also in hair dye, confectionery (lead chromate being used instead of saffron), dripping preserved in lead-glazed vessels, and even in lead-glazed lining in hats. The treatment of acute lead-poisoning is given under

Poisons, and of chronic lead-poisoning under *Dangerous Trades.*

LEECHES are often used as an alternative to bleeding from a vein. A leech withdraws from one to two drachms of blood only, but by fomenting the wound after the leech has dropped off, nearly an ounce of blood is usually withdrawn before bleeding ceases. The application of six to eight leeches in heart disease and congested liver is often most useful. Care should be taken that they are applied over some bone if possible, in order that pressure can be readily applied to the bite it necessary. Loose tissue like that round the eye should be avoided and the nearest bony point, which in this case is the temple, chosen instead. Nor should a leech ever be placed over a vein. Leeches are best applied in a test tube, which is pressed on the spot chosen, or they are apt to wander from the spot and bite elsewhere. To get them to bite is often a matter of time. The patient's skin should be quite clean, and scented soaps avoided in cleansing it; if the leech still refuses to bite, the application of a little milk should be tried. To remove a leech a pinch of salt should be applied to it. If they are pulled off their teeth will be left in the wound and cause trouble. To stop bleeding from a leech bite a few strands of cotton-wool should be applied, and then a pad of wool and a bandage so as to secure some pressure. If necessary, the bites may be touched with hamamelis (sold also under the name of hazeline), and if this fails, recourse should be had to lunar caustic.

LEG, SWOLLEN. When both legs are swollen the cause may be tight garters, anæmia, pregnancy, or dropsy in the abdomen, or heart disease. When only one is swollen the cause may be varicose veins, clotting in the chief veins of the leg, or pressure on them from some swelling in the groin. After childbirth, if slight inflammation occurs in the womb, it is not uncommon for the veins of the womb to clot, and for the clot to spread to the great veins of the thigh. First one leg, and a few days later the other leg swells, usually a fortnight or so after childbirth. This condition is termed *white leg.* The treatment for swollen leg is the removal of its cause, and meanwhile the feet should be kept off the ground. In the more severe cases they should be wrapped in wool or fomentations of belladonna and glycerine applied. A case of "white leg" usually takes from six to twelve weeks to recover.

LEMONADE. To make this useful drink for the sick-room:—

> Two lemons, an ounce of loaf sugar, and a pint of boiling water are required. The top and bottom of the lemons, as well as the white and the pips, (all of which are bitter), should first be removed. The lemons are then squeezed in a lemon squeezer, the peel cut fine, the sugar added, and lastly the boiling water. The whole is allowed to stand till cold.

LEMON JUICE, in the form of lemonade, is a useful summer drink, though if taken too freely it may cause dyspepsia. Lemon juice is a valuable remedy for scurvy. There is little doubt that lemonade made from lemons is far better than that prepared from citric acid. Lemon juice and water in equal parts is used as a lotion in the treatment of freckles, though seldom with much effect.

LEMON, SALTS OF, is potassium oxalate, a dangerous poison.

LENS. See *Eye.*

LEPROSY is a chronic disease caused by a bacillus or germ, and characterised by the presence of nodular swellings in the skin and mucous membranes, or in the nerves. The disease is at present chiefly one of the hot countries, though in the Middle Ages it prevailed in Europe, including England, as many of our churches testify; for they present the "squint holes" through which lepers were permitted to see the mass without being permitted to enter the church. At the present day leprosy is rare in Europe, except in Norway and some parts of Russia. That the disease dates from remote antiquity is clear from the Old Testament. The cause is a special bacillus conveyed from the diseased to the healthy by contact. It is not highly contagious; thus Professor Osler says, "Not one of the Sisters of Charity who have for more than forty years so faithfully nursed the lepers at Tracadie has contracted the disease." Mr. Jonathan Hutchinson has of late strongly urged his "fish theory" as the cause of the disease. According to this theory, the infection is either conveyed in rotten fish, or else only succeeds in establishing itself in those who frequently eat it. Except in South Africa, the distribution of leprosy and of the habit of eating fish imperfectly cured, or avowedly high, roughly correspond. On the other hand, it is not yet by any means certain that this is the only way in which leprosy can be caught. Nevertheless, the evidence is sufficient to make it desirable to withdraw the Indian tax on salt in order to promote the more thorough curing of fish.

LESION is a morbid change in any organ produced by injury or disease.

LETHARGY. See *Debility.*

LEUCOCYTE is the technical name of the white corpuscle found in the blood in large numbers. Its function is to attack and destroy all disease germs which gain entrance to the blood. The germs, in turn, secrete poisons to destroy the leucocytes. Matter, or pus, is composed mainly of dead leucocytes, killed in their fight with the germs.

LICE lay eggs or nits, that are attached to the hairs by a ring of cement, which makes them very difficult to remove. The affection is by no means confined to the children of the poor. The best treatment, short of removal of the hair, is the application of some lotion, which dissolves the cement, followed by the thorough use of a fine-toothed comb. In many hospitals, a lotion of vinegar and methylated spirit in equal parts is used. The hair is thoroughly soaked in this lotion and then rags steeped in it are placed on the hair, and the whole is enclosed in a mackintosh bathing-cap for the night. Carbolic lotion (of a strength of 1 in 20) is also used in the same way, but though efficacious, it has the drawback that the absorption of some of the carbolic causes the urine to be green next morning. This, however, is not serious, for once or twice, in a child otherwise healthy. Care should be taken to keep the lotion out of the eyes. "Izal," which is non-poisonous, is a good substitute for carbolic. If the odour can be tolerated, thoroughly soaking the hair in petroleum will destroy the lice and loosen the nits. Sores in the scalp should be treated with white precipitate ointment. In bad cases with numerous crusts, after cutting off the hair, a linseed poultice smeared with olive oil should be applied. This will remove the crusts, and white precipitate ointment may be then applied.

LIFE. See *Death-Rate.*

LIFTING is the cause of many accidents when improperly performed. The trick termed "seeing London," in which the child's head is grasped by the hands placed on each side of the head and the child then lifted, has caused death by dislocation of the spine. Again, the common mistake of pulling a child by one arm or even lifting it thus, often produces a dislocation of one of the bones of the fore-arm. No growing limb should ever be forcibly pulled. It should be remembered that a bone develops in three pieces—a shaft and a cap at each end. The latter is readily detached by a sharp pull, an accident which usually results in that limb being shorter than its fellow for life. For lifting helpless patients, see *Sick Room.*

LIGHT is of great value to health. It kills germs, stimulates growth, and promotes a cheery frame of mind. To keep the blinds always down in order to protect the carpet from fading is not the best policy in the long run. Light is used in the treatment of certain diseases. Finsen, of Copenhagen, demonstrated that sun-light passed through green screens, to remove most of its heat, and focussed on skin affected with lupus had a curative effect. The treatment is now widely practised, its introduction into this country being largely due to Queen Alexandra. Instead of sunlight electric light is utilised. Sun-baths are also used for many conditions. They consist of basking in the sun whilst lightly clad. It is doubtful if the sun bath merits all that is claimed for it. [Refer to *Lupus.*]

LIGHTNING may kill by burning or by shock. Not infrequently, though the horse is killed, the rider is stunned.

In one case a man's watch-chain was fused and burnt deeply into the flesh, yet the man himself was not burnt, and after many weeks of unconsciousness made a perfect recovery. His horse was killed and the saddle torn to ribbons. Recovery is often only partial, paralysis of some kind being permanent. The *treatment* is warmth, stimulants, and artificial respiration, if necessary.

LIME in the eye. See *Eye*.

LIME-WATER is often useful in diarrhœa. It contains less lime than milk does. By using the saccharated lime-water a much more concentrated solution is obtained. Lime solutions do not keep.

LINIMENTS are fluids to be rubbed or painted on the skin. The Pharmacopœia contains fifteen. They are used either to soften the skin and act as a lubricant in massage, e.g., soap liniment; to soothe the sensory nerves, e.g., aconite and belladonna liniment; or most often to act as a counter-irritant, e.g., compound camphor liniment, turpentine liniment, or iodine liniment.

LINSEED TEA is good for sore-throat. To make it:—

> An ounce of linseed to the pint of boiling water is allowed to stand in a covered vessel in a warm place for four hours; it is then strained and may be flavoured to taste with lemon juice.

LINT is a dressing for wounds prepared from flax. It presents a rough and a smooth side, the latter being the one to place next the wound. As a dressing should contain some antiseptic, boracic lint forms a better dressing than plain lint.

LIP. Sores or warts on the lips, especially after middle age, should receive prompt attention, as they may, if neglected, become cancer. Cigarettes and broken clay pipes are common causes of such sores. *Cracked Lips* should be treated with cold cream every night. If they do not heal, flexile collodion should be painted on night and morning. *Herpes or Shingles* on the lip consist of a patch of small blisters on an inflamed base. They cause much burning and pricking. The application of zinc ointment is the best treatment. They do not last many days. [Refer to *Hare-lip*.]

LIQUORICE is useful in the form of a solid extract, sold in sticks, for sore throat. Liquorice Powder owes its aperient action chiefly to the sulphur and senna it contains.

LISP. See *Speech*.

LITHÆMIA, literally "stone in the blood," denotes the gouty state, a condition in which the blood is laden with salts of uric acid ready to crystallise out in the form of chalk stones in the joints, ears, and elsewhere. [See *Gout*.]

LIVER is the largest gland in the body situated under cover of the ribs, on the right side, but extending almost across to the ribs of the opposite side. Its average weight is fifty ounces. The blood supply is remarkable, as all the blood from the stomach, intestines, and spleen has to pass through the liver to reach the heart. The liver has many functions, the chief of which are these: (1) the secretion of bile; (2) the storage of the sugar derived from digestion, until the muscles require it; (3) the production of a body easily removed by the kidneys, named urea, from the waste products in the blood; (4) the separation of any poison from the blood and the discharge of this in the bile. Failure in function (1) causes dyspepsia and constipation; failure in (2) causes one form of diabetes; failure in (3) causes gout; and failure in (4) exposes the body to many poisons produced in the intestines by indigestion or to poisons accidentally swallowed. The liver thus acts as a sentinel guarding the entrance from the stomach and intestines into the general circulation.

Sluggish Liver is a common ailment in those engaged in sedentary occupations. The bile is produced at a much lower pressure than is the secretion from most glands, and in order to reach the intestine it has to pass through a complex network of ducts, the friction caused by which is considerable. With each breath the diaphragm descends and kneads the liver between the bowels below and the diaphragm above. It is in this way that the bile is mainly expelled. Hence all exercise promotes the flow of bile, especially horse exercise. The symptoms of sluggish liver are irregularity of the bowels, the motions being one day dark and scanty and the next pale and copious; a sallow complexion, slight jaundice in the white of the eye; a feeling of weight after meals and lowness of spirits. The treatment is suitable exercise, a course of mild aperients, avoidance of alcohol and rich food, and a tonic composed of hydrochloric acid and gentian.

Cirrhosis of the liver is a disease due to the repeated presence in the blood supplying the liver of some poison, the most usual being alcohol. The liver, at first, irritated by the poisoned blood, becomes congested, and, later, the fibrous framework of the liver grows at the expense of the more important and more delicate portions. Hence the liver changes to a fibrous mass containing but little of the original liver substance. Two results follow: (1) the functions of the liver must be most inadequately performed, (2) the fibrous tissue contracts as it grows and hinders the circulation through the liver, and congestion of the stomach, spleen, and intestines is thus caused. Such patients suffer from morning sickness, loss of appetite, piles and finally dropsy as the result of the congestion, and from wasting and feeble health as the result of a lethargic liver. The disease is also known as "gin drinker's liver," or "hob-nailed liver," although there are other poisons besides alcohol capable of producing it. The treatment is the relief of congestion by blue pill and Epsom salts, the removal of dropsy when necessary by tapping, and if there is much wasting, the use of peptonised foods.

Abscess of the Liver is rare except as a complication of dysentery. It causes pain, swelling of the liver and fever, and is treated by a surgical operation. *Cancer* is of frequent occurrence, generally secondary to cancer of the bowel. It is most frequent between the ages of 40 and 60. The symptoms are pain and enlargement of the liver (the weight may rise from 50 ounces to 20 pounds) with dropsy, great wasting and often jaundice. Death is to be expected within two years. *Hydatid Cyst*, due to a parasitic worm, more often occurs in the liver than in any other organ.

Drugs acting on the liver include mineral acids, podophyllin, rhubarb, euonymus, and salts of soda, e.g., those in Vichy and Carlsbad water. These drugs stimulate the flow of bile. Calomel and blue pill promote the expulsion of bile that has entered the intestine, before it has time to be re-absorbed, and thus indirectly stimulate the formation of fresh bile. It is a serious mistake to substitute pills for the regular exercise that is the natural way of promoting bile flow. [Refer to *Gall Stones, Hydatid, Jaundice, Constipation, Exercise, Food*.]

LOCK-JAW, or *Tetanus*, is an infectious disease in which spasm of certain muscles is the chief symptom and which is caused by a bacillus or germ, that lives in garden mould and manure, and gains entrance as a rule through a scratch in the skin. The old belief that a cut on the thumb causes lock-jaw is simply an expression of the fact that wounds of the hands, from their exposed position, are apt to become infected with dirt. Gardeners, stable-hands, and the bare-footed children of the poor are more often attacked than others. The poison produced by the tetanus germ has been isolated and shown to be about one hundred and fifty times as poisonous as strychnine. The incubation period is less than a week in the worst cases, but longer than this in the milder ones. The *symptoms* are at first difficulty in biting, with stiffness of the neck, and later the abdominal wall becomes hard and board like. Any irritation, e.g. a sudden noise, brings on a most painful spasm of the whole body, in which the breathing may be arrested. The temperature rises in the worst cases. The *treatment* consists in cauterizing the wound, putting the patient to bed in a quiet, dimly-lighted room, injecting tetanus antitoxin, or failing this giving chloral and bromide, of each ten grains, every three hours, and feeding the patient through the nose, or by the bowel, if it cannot be done through the mouth. The Greeks taught that such cases as survived four days recovered, and Professor Osler holds this to be true at the present time. The longer the incuba-

tion period the greater the chance of recovery, and the earlier antitoxin is given the more effectual it will prove.

LOCOMOTOR ATAXY, or *Tabes Dorsalis*, is a chronic and incurable disease of the spinal cord, usually caused by syphilis contracted many years before. That part of the cord is attacked which carries the sensory impulses from the limbs to the brain. Hence there is no lack of power, but as the position of the limbs is unknown unless they are seen, the normal control over them is absent, and the legs have to be looked at whenever the patient walks. If it is dark or the eyes shut the legs can no longer be guided correctly. As the disease progresses more and more careful nursing is required. No known treatment cures the disease, though temporary improvements are common. The patients often live twenty or thirty years.

LOGWOOD contains hæmatoxylin, an astringent body of nauseous taste, used to check diarrhœa. The chief preparation is the decoction, a dose being two to four tablespoonfuls for an adult every three hours till the diarrhœa is checked. It may be combined with chalk (which see). It colours the urine dark red, and stains any clothing on which it is spilt.

LOSS OF BLOOD. See *First Aid.*

LOTION is a solution of some drug used for bathing the skin, eye or other part. A liniment differs from a lotion in being rubbed in.

Antiseptic Lotions for bathing wounds, include boracic lotion (saturated solution), carbolic lotion (1 in 40); for bathing an eye, boracic lotion (a drachm to the pint, used at blood heat).

Cooling Lotions include methylated spirit and *liquor ammonii acetatis* of each two ounces, and water to the pint, and vinegar lotion (water and vinegar in equal parts).

Soothing Lotions include calamine lotion (calamine an ounce, zinc oxide an ounce, glycerine an ounce, made up to the pint with water); lead lotion (lead acetate twenty grains, glycerine an ounce, made up to the pint with water).

Astringent Lotions, red lotion (sulphate of zinc a drachm, glycerine three ounces, lavender water to the pint); alum lotion (two drachms of alum to the pint).

LOZENGES are widely used as a convenient method of carrying and administering medicine. The Pharmacopœia contains seventeen. Messrs. Burroughs and Wellcome have utilised the lozenge extensively in preparing medicine for the tropics and Colonies, and have invented a special mode of preparation which produces what they term a "tabloid." Medicine in tabloid form, each of known dose, is by far the most suitable for the domestic use of the colonist and others distant from home. For treating the throat, lozenges slowly sucked are often used, as most frequently gargles do not reach the back of the throat. Lozenges are termed trochischi in the Pharmacopœia, thus:—

Troch. acidi tannici or troch. krameriæ et cocainæ are useful for relaxed throat; troch. ipecac. et morphinæ for a hacking cough; troch. pot. chlor. for sore throat or tonsillitis; and troch. bismuthi co. is a cheap and convenient way of taking bismuth, which is difficult to prepare satisfactorily as a mixture.

LUMBAGO is an affection characterised by severe pain in the muscles of the loins. The pain is of sudden onset, and sufficiently severe as a rule to confine the sufferer to bed. It is recognised by an increase of pain on stooping. The cause is usually chill. It is uncertain whether it is of rheumatic origin or not. Labouring men suffer most from it. The treatment is rest, combined with poultices to the loins, and compound camphor liniment well rubbed in four times daily.

LUNACY. See *Insanity.*

LUNAR CAUSTIC is silver nitrate. It is used for destroying "proud flesh." If it comes in contact with the skin it will leave a dark brown stain unless iodide of potassium is applied promptly.

LUNGS. Early in fœtal life an outgrowth appears from the top of the gullet, which grows down in front of the gullet and bifurcates into two. The main stalk becomes the wind-pipe, the root of each of the two divisions a bronchus, and each division a lung. The wind-pipe remains in front of and in contact with the gullet throughout life. The lungs are elastic, so that they tend to empty themselves when they are inflated. They are richly supplied with blood, which is brought into contact with the air lying in spaces between the blood-vessels. By this means the blood is enabled to take in oxygen, and give out water-vapour and carbon-dioxide. The air passages are lined with cilia, or fine hairs, that keep up an incessant movement directing dust towards the mouth. Sufficient dust, however, is absorbed in a lifetime to change the colour from pink to grey, and if the air breathed be specially dusty, disease is caused (see *Dangerous Trades*). The air passages are moistened by the secretion of slime or mucus.

If the bronchi become inflamed—a condition termed "bronchitis"—the mucus is produced in excess, and is coughed up as phlegm. Inflammation of the lung substance is "pneumonia." Loss of elasticity is apt to occur with advancing age, which makes it difficult to expel the air from the lungs—a condition termed "emphysema." Sudden spasm of the air passages combined with swelling of their lining membrane greatly impedes the passage of air and gives rise to "asthma." Tuberculosis of the lung is "consumption." Cancer of the lung is very rare. [For an account of the diseases mentioned, see under their respective headings; see also *Breathing* and *Chest.*]

LUPUS VULGARIS is tuberculosis of the skin. The same germ which causes consumption when it attacks the lung produces lupus when it invades the skin. The disease nearly always begins before the age of twenty. The disease at first resembles a wart deep in the skin of the lip or cheek. The skin around becomes red and ulceration with spreading alternates with scarring and attempts at repair for a great number of years. Until recently scraping, burning and caustic ointments were in vogue; but Finsen, of Copenhagen, showed that concentrated sunlight, filtered through green glass to remove some of its heat, has a curative effect by killing the tubercle bacilli, which are sufficiently near the surface in this disease to be reached by the rays. The treatment is painless, but tedious, repeated sittings being indispensable. The treatment is now wide-spread, electric light being used instead of sunlight. Queen Alexandra was one of the first to introduce the treatment in London. The X rays are also used for the same purpose. Good results have been obtained recently, by Wright and others, by the injection of suitable doses of tubercular vaccine.

LYMPH, though quite as important as blood, is but little known to the public, probably because it is colourless. The fluid part of the blood, containing much nourishment, leaks through the walls of the finer blood-vessels and bathes the surrounding tissues, which it nourishes. This escaped fluid is "lymph." The excess of lymph is collected into lymphatic vessels, which ramify everywhere, and converge on larger vessels that finally unite to form the right or left thoracic duct. The thoracic ducts open into the subclavian vein, of their own side, at the root of the neck. The escape of blood from the vein backwards into the lymphatics is prevented by valves. Filters are situated at frequent intervals along the course of the lymphatic vessels in order to purify the lymph from germs, etc. The filters are termed "lymphatic glands." Obstruction to the circulation causes swelling due to the accumulation of lymph, and due to the same cause is dropsy in the abdomen or chest. The fluid contained in a blister is lymph. Hence lymph, in the public mind, means material for vaccination, because the contents of a vaccination blister are used for the purpose.

LYSOL is a disinfectant often used for scrubbing macintosh sheets and the like. The best strength is four teaspoonfuls to the pint of water.

MADNESS. See *Insanity.*

MAGNESIA. The *oxide* is insoluble and so less pleasant to take than either the carbonate, in the form of fluid magnesia, or the citrate, which effervesces when mixed with water. The *citrate* in doses of one to four teaspoonfuls, according to age, is useful for dyspepsia and constipation with dryness of the mouth. It is, however, too mild an aperient for most people. The taste is im-

proved by the addition of lemon-juice. The *fluid magnesia* in doses of one to two fluid ounces is a good aperient for children. The *oxide* in ten grain doses is used to correct acidity, though bicarbonate of soda is perhaps better for this purpose. As an antidote to poisoning by a mineral acid, oxide of magnesia is the best we have. It should then be given in large doses in a little milk or egg and water. *Sulphate* of magnesia is the same as Epsom salts, a valuable purgative. [Refer to *Constipation.*]

MALARIA. See *Ague.*

MALT EXTRACT is a treacle-like substance prepared from malt which has considerable nutritive value. Extract of malt, combined with cod-liver oil (dose, two teaspoonfuls after each meal for a child), is useful in the treatment of wasted, tuberculous, or debilitated children.

MANIA is a form of insanity, characterised by excitement, the lunatic himself being then a maniac. See also *Monomania.*

MANNA exudes from cuts made in the bark of certain trees and crystallizes into irregular masses of sweetish taste and laxative action. It is readily soluble in milk. A piece the size of a lump of sugar may be added to the baby's bottle when a mild laxative is desired.

MARASMUS, literally "wasting," is a condition common in infancy, and due to many causes. See *Wasting.*

MARRIAGE. See *Heredity.*

MASSAGE is skilled rubbing. The purpose to be served is to promote the circulation in the part massaged. It is of great service in sprains that are slow in improving, in chronic joint troubles, in the later stages of the treatment of fractures, and for its effect on the nervous system. A more general massage is used in the treatment of insomnia, nervous exhaustion, and constipation. The movements used in massage are divisible into stroking, kneading, rubbing and striking. *Stroking* should be always up a limb, bony joints being avoided, and the friction is usually lessened by the use of boric powder or soap liniment. *Kneading* requires more skill. The hand of the operator with the skin of the patient should move together over the muscles beneath, to which the kneading is applied. *Rubbing* is performed in small circles, the finger tips and the ball of the thumb and the little finger being alone used. *Striking* is performed chiefly with the edge of the hand. Those unskilled in massage should confine themselves to stroking and rubbing.

MATERIA MEDICA, that branch of the science of Medicine which treats of drugs and curative agents, their properties, uses, and effects upon the human system.

MEASLES, *English,* is an infectious fever due to a germ which has not been discovered up to the present. Infection is conveyed by direct contact of the sick with the healthy, especially during the early part of the illness before the rash appears. More rarely, the infection is carried in infected clothing or toys. The season at which the affection is most prevalent is the spring and autumn. The age most liable to attack is childhood. Although one attack protects from subsequent ones in most cases, second and even third attacks may occur. [For incubation and quarantine periods see *Fevers.*]

The *symptoms* are gradual in their onset. They consist at first in running at the eyes and nose, sneezing, coughing, and pain on exposure to bright light. A faint rash may be visible behind the ears or at the margin of the hair during the first three days, but the real rash comes out on the fourth day. This rash is recognised by the presence of dull, red, slightly raised blotches and pimples which appear first on the face, especially around the mouth, and next day on the trunk and limbs. The blotches enlarge and unite with neighbouring ones, so that crescent-shaped patches are formed. In a week the rash fades, leaving staining in the skin for another week. The temperature rises at the onset of the cold in the head to 102° or 103° F. On the second day the temperature may fall and the child is thought to be getting over its cold. On the third day, however, the temperature rises again and remains high until the rash is fully out, which occurs on the fifth day. Within thirty-six hours the temperature then falls to normal and the patient feels very much better. If the temperature is not normal by the eighth day, some complication is present and a doctor is necessary.

The *complications* include, broncho-pneumonia, diarrhœa and convulsions, and in badly nourished children discharge from the eyes or ears is common. During convalescence tuberculosis of the lungs or the glands of the neck may occur. Broncho-pneumonia arises from the inflammation which in an attack of measles is always present in the mouth and nose extending to the bronchi and lungs. It should be suspected when the margins of the nostrils dilate with each breath, and the breathing is hurried and the voice weak. The condition is serious and a doctor urgently needed.

The *treatment* of an uncomplicated attack of measles is to isolate the patient in a room in which the atmosphere is warm but not stuffy. Much harm may be done by overheating, a mistake often made. The child should be confined to bed while the temperature is high and for two days afterwards. The clothing used should be flannel combinations, as nearly all children kick off the bed-clothes during sleep, and a chill in measles may start a fatal attack of broncho-pneumonia. The diet should consist of milk, barley-water, farinaceous food, and raw eggs beaten up. Owing to the tendency to diarrhœa, fruit, lemonade and beef tea should be used only moderately. For the same reason aperient medicine should be given with great caution. The medicine required is a cough mixture, e.g., carbonate of ammonia a drachm and a half, ipecacuanha wine one ounce, glycerine four ounces, water to twelve ounces: the dose for a child under two years is one teaspoonful, over two years two to three teaspoonfuls, given every four hours. The child should be guarded from strong light. The room should be darkened and care should be taken not to bring a candle near the child's eyes at night. A warm bath may be given if the fever is high. During convalescence, which begins when the temperature is normal, the child should have plenty of sunlight and fresh air, and a sea-side holiday, if possible, before returning to school. Some cod liver oil and malt, hypophosphites, or other tonic is commonly given. [Refer to *German Measles.*]

MEASLY MEAT is meat infested by the tape-worm in an immature stage, which covers it with small bladders about the size of a currant. If such meat is imperfectly cooked, the bladder wall is digested by the stomach, and the young worm being then set free attaches itself to the intestinal wall and grows into the adult form. Both pork and beef are liable to be thus attacked.

MEASURE GLASSES should always be used in the sick room. Two sizes should be obtained—a minim glass and an ounce measure. It must be borne in mind that 60 minims or "drops" make a fluid drachm, 8 drachms a fluid ounce, and 20 fluid ounces one pint. A drop, then, in medical work means the sixtieth part of a drachm and should always be measured. The minim glass is graduated for 120 minims. The ounce measure is graduated in drachms, and often at the four-drachm mark the word tablespoonful is inserted. Error may hence arise, for one ounce is two tablespoonfuls. Roughly speaking, one fluid drachm is a teaspoonful. For measuring urine, porringers can be obtained with the half pint and pint levels marked on the inner surface.

MEAT AND MEAT EXTRACT. See *Food.*

MEDICINE, *Administration of.* Accuracy in the dose and time of administration is important. The vessel in which the medicine is given should be scrupulously clean and thin-lipped, a medicine or wine glass being preferable to a thick china spoon. If any sediment is present, the bottle should be well shaken. Food should seldom be used to administer medicine in, for unpleasant associations are thus induced. Pills should be taken with the head upright or a little forward, and a little water should be used to aid in swallowing them. Powders are best placed on the back of the tongue, and a little water then taken. It is the rule in prescribing to order a drug at such a time that it may aid nature as much as possible;

thus aperients are so ordered that they would act after breakfast, sleeping draughts so that they will induce sleep at the natural time. Hence such aperients as castor oil or calomel, which take some time to act, should be given at bed-time, and those, like seidlitz powders and Epsom salts, which act quickly, are best given before breakfast. Most of the sleeping draughts should be given about two hours before the usual hour of sleep, though trional dissolved in hot brandy acts in an hour. Drugs that irritate the stomach are given freely diluted after a full meal; and those that damage the teeth, e.g., iron and acids, are best given in pill form or taken through a quill, or the teeth should be cleaned directly afterwards. Nauseous medicines are best taken in capsules or with the nostrils firmly pinched, and a little salt may be placed on the tongue first. A raisin is one of the best things to eat afterwards, especially after an oily medicine. When it is important that a drug should act as soon as possible, it is injected under the skin with a hypodermic syringe. When a patient is unable to swallow, medicine may be given by the bowel, injected with a small glass syringe, or by a Higginson's or a douche can.

MEDICINE CHEST. A small store of drugs and medical appliances are highly desirable in any home, and indispensable when medical aid is not easily procurable. The remedies to be kept handy, which we think desirable in any case, are given first, and afterwards a list of more powerful remedies to which recourse should be had only when no doctor is obtainable within twenty-four hours. In all cases, it is wise to have two medicine chests or cupboards —one for outward applications, and the other for remedies to be taken by the mouth.

APERIENTS.—Castor oil, Epsom salts or a natural water containing it, e.g. Hunyadi Janos, cascara in pill form, effervescing citrate of magnesia in a well-stoppered bottle, and other aperients, if desired, provided they are of a mild nature (see *Constipation*).

ANTISEPTICS.—Boric acid powder, and a stronger disinfectant, e.g. Jeyes' fluid, Izal, etc. (see *Disinfection*).

DRESSINGS.—See *Wounds*.

INVALID FOODS.—A tin of condensed milk, a tin of partially digested starchy food, e.g. Benger's, and a tin of meat extract, e.g. Liebig or Bovril.

MATERIALS FOR POULTICES.—Linseed meal, bran, flannel, and olive oil.

APPARATUS.—(1) Measure glasses, two in number, one for minims, and one for fluid ounces. (2) An ear-syringe. (3) Thermometer for taking the invalid's temperature.

OINTMENTS.—Vaseline, cold cream, zinc ointment.

USEFUL ADDITIONS:—Sal volatile, cognac brandy, smelling salts, bicarbonate of soda, citric acid, essence of peppermint, dill water, glycerine, chlorate of potash lozenges, sticks of liquorice, phenacetin in five grain tablets; and for outward application only, the dilute solution of ammonia, lead lotion, camphorated oil; and for inhalation at the onset of a cold, eucalyptus oil.

In addition to the above, for homes far from medical aid, some more potent drugs are requisite:—

Opium in the form of laudanum, Dover's powder, and the tincture of chloroform and morphia; bromide of potassium, quinine in powder or tablets, ipecacuanha wine, syrup of squills, salicylate of soda, calomel, colocynth and hyoscyanus pills; and for outward application, belladonna glycerine, Friar's balsam, tincture of hamamelis or hazeline, and a little pure carbolic acid for application to the cavity of an aching tooth. [Refer also to *Wounds*].

In the case of solid drugs, the more potent should be in the form of tablets of known weight each, so that no error can arise as to the dose taken; and for the same reason, the dose as well as the name of the preparation should be plainly stated on the label in all cases.

Travellers find the drugs provided in tabloid form by Messrs. Burroughs, Wellcome, and Co. of great service on account of their portability and their resistance to the high temperature of the tropics.

MEGRIM or **MIGRAINE.** See *Bilious Attack*.

MELANCHOLIA. A form of insanity characterised by severe mental depression. [See *Insanity*.]

MEMORY is liable to curious variations. It is diminished by fatigue and by a low state of the general health. It varies at different times of life, thus memory for disconnected facts, especially in the form of rhymes, is greater in childhood than at any other time. In old age recent events are remembered badly and past events are recalled with unusual clearness, hence the form of dotage aptly described as "anec-dotage." In infancy the memory is very rudimentary, the second birthday being with most people the earliest event that can be recalled, and it is only after this date that the power of learning the mother-tongue becomes active. Memory depends mainly on the impression made on the mind at the time of the occurrence; it is thus an advantage in learning to call into play two or more sense-organs concurrently, and if practicable some muscular movement besides. Hence note-taking helps to impress a lecture, and a skilled movement, e.g., cycling, once acquired is rarely forgotten. After an injury to the brain, a fever, or prolonged bout of intemperance, loss of memory is common. Abnormal acuteness of memory occurs in the course of drowning, &c., and in certain stages of intoxication with alcohol, opium, cocaine and other drugs.

It is from this fact that many a genius has become the helpless victim of a drug habit. Remarkable power of memory for a certain class of facts to the exclusion of all others is met with in certain idiots; thus, one inmate of a large idiot home knew the exact number of articles sent to the wash each week for years past, with perfect accuracy, but knew nothing else. The chief perversion of memory is that in which an event unconnected with oneself is remembered as if one was closely concerned with it. Such a condition is most often met with in insanity of alcoholic origin, and is often the starting-point of elaborate delusions.

MENIERE'S DISEASE is characterised by giddiness with deafness, and is due to disease of part of the internal ear. [See *Ear*.]

MENINGITIS is inflammation of the membranes that surround the brain. It is the commonest form of *Brain Fever*, a vague term in wide popular use. The condition is usually due to tuberculosis or to inflammation that spreads from disease of the ear. The chief *symptoms* at the onset are headache, vomiting, fever, constipation, convulsions and a shrill cry in which the child puts its hand to its head as though in pain. The child lies curled up in a drowsy state, but is sufficiently conscious to resent the bed-clothes being drawn down. The head is often drawn back. The outlook is always grave, and the case should be in medical hands from the outset. [Refer to *Brain*.]

MENSTRUATION. The time of onset is from thirteen to seventeen years of age in temperate climates, and before this in the tropics, especially amongst the natives. The duration of each period is about five days, though it varies from one to ten days in women apparently healthy. The period recurs every twenty-eight days with occasional exceptions, for about thirty years from its onset, though near the commencement and conclusion of this time irregularities are common. Menstruation is accompanied by certain effects on the general health, e.g. headache, backache, and languor. Abnormally it may be sufficiently painful to necessitate retiring to rest. Painful menstruation is best treated by hip baths, avoidance of chill, and rest. Alcohol, morphia, and other drugs, in an affection of this kind apt to recur, should not be employed, for a drug habit is formed much more quickly than the beginner imagines. Absence of menstruation occurs in anæmia, wasting diseases and nervous diseases. It will right itself as soon as the disease is cured. Irregular menstruation, should be promptly reported to the family doctor.

MENTHOL is a crystalline material, allied to camphor with the odour and taste of peppermint, insoluble in water, but readily soluble in olive oil. It should be kept in air-tight tins. Solid menthol, when applied to the skin, causes numbness, and is thus useful in relieving neuralgia or headache. It may also be applied in the form of menthol plaster.

MERCURY is the active ingredient in blue pill and grey powder. The compounds of mercury include calomel, dose 1–5 grains, a valuable purgative; perchloride of

mercury, a valuable antiseptic; yellow oxide of mercury from which a stimulating ointment is prepared. [Refer to *Dangerous Trades, Poisons.*]

MESMERISM. See *Hypnotism.*

MICROBE is a disease germ—a parasitic plant belonging to the class of fungi. [Refer to *Bacteria.*]

MIDRIFF. See *Diaphragm.*

MILK consists of water, proteid, carbohydrate, fat and salts. It thus contains the five essentials to make a complete food. It is, however, not sufficiently digestible to the adult to constitute a sole diet during active work, though two to three pints a day will often satisfy an invalid at rest in bed. The stomach of the infant is specially adapted for its digestion, and it should constitute the only diet of the infant for the first six months of life. The composition of milk varies slightly in different animals; that of the ass most resembles the human product. The proteid in milk is in the form of albumin and of caseinogen; the carbohydrate is a tasteless sugar—named lactose or milk sugar—and the fat is the cream, which is evenly distributed through the milk in microscopic drops, so as to constitute a natural emulsion. The salts include all the material necessary for the mineral part of bone, and as there is more lime in milk than in lime water, there is no need to attempt to improve on nature by adding lime water in order to "prevent rickets."

When swallowed, the rennet of the stomach juice changes the soluble caseinogen into insoluble shreds of casein, which form a sponge-like meshwork that entangles the cream in its meshes. The resulting mass is the curd. Rennet prepared from the stomach of the pig or calf is used to make curds and whey—a process exactly the same as the first stage of the digestion of milk. The curd is slowly dissolved by the stomach juice subsequently. It is owing to this fact that human milk is so much more digestible than cows' milk. Cows' milk contains a great deal more casein than human milk, and the result is the infant is usually unequal to the task of dissolving the masses of curd that form in its stomach after a meal of pure cow's milk. Such undigested curds turn sour, if not vomited, and poison the child. For infant feeding, cow's milk should be diluted with two or three times its bulk of barley-water, for a lighter and smaller curd is thus obtained [see *Infancy*]. For invalid diet, similarly, milk should be diluted, but soda water in that case is the best diluent. It should, moreover, be regarded as food and given at regular intervals only, thirst being relieved between whiles by water, lemonade, etc., but not by milk. When dilution does not render the milk sufficiently digestible, it may be peptonised, or the curd may be removed *in toto*, by making curds and whey, and using, instead of milk, whey with the addition of cream; we then give all the ingredients of milk without the casein. Appended are the recipes for the above methods:—

To peptonise milk. Take a pint of milk, add a quarter of a pint of water, and boil half of it; add this to the cold milk. The resulting mixture is roughly at blood heat. Add 20 grains of bicarbonate of soda (a saltspoonful), and two teaspoonfuls of liquor pancreaticus, and put aside in a warm place for twenty minutes. Then arrest the peptonisation by boiling or by standing on ice, otherwise the milk becomes too bitter. It should be kept in a cool place and made fresh every twelve hours. Pancreatising powders are also used instead of liquor pancreaticus. Fairchild and Benger are two reliable makers. If skimmed milk be used and cream added after peptonisation the peptonised milk is rather more palatable.

To make whey. Take half a pint of milk, boil half, and mix the hot and cold portions together. Add two teaspoonfuls of rennet, e.g., Benger's, and allow to stand in a warm place. The curd forms, and after some time it contracts and squeezes out the whey. Decant. One teaspoonful of cream to four tablespoonfuls of whey is the right proportion for infant feeding.

To Humanise Milk. Make whey as above: boil it, and stir in 110 grains of milk sugar for each third of a pint of whey. Allow to cool, and add twice as much new milk. For each pint of this mixture of whey and milk add two teaspoonfuls of cream and stir. The cream should be fresh as preserved cream usually contains boric acid or other preservative that is harmful. The food should be made fresh every twelve hours, kept standing in a cool place, preferably on ice, and warmed as required. If this fails to agree with the infant, equal parts of whey and milk should be tried, and finally whey and cream only.

To Pasteurise Milk. This is to sterilise milk without boiling it. The milk is placed in a double boiler and steamed for twenty minutes. It is then free of all the common disease germs liable to contaminate it and at the same time retains the taste and properties of raw milk. Instead of a double boiler, a bottle of milk may be stood on a drainer in a large saucepan, water added below the level of the drainer, the saucepan lid put on, and the whole placed on the fire so that the milk is steamed.

MINERAL WATERS in common use are those which contain carbon dioxide gas dissolved under pressure, e.g., soda or seltzer water. The term also includes the medicinal waters of the Spas. [Refer to *Health Resorts.*]

MISCARRIAGE, or *Abortion.* Whenever a woman has reason to believe that she is threatened by abortion, she should at once go to bed and remain there quietly until all symptoms have disappeared. If the hæmorrhagic discharge be profuse, everything given by the mouth should be cold, the patient not too warmly covered, and all movement avoided. Should the hæmorrhage continue to be severe, medical assistance should be at once secured. Abortion is not the trivial trouble so often imagined by women. It is always a possibly serious condition, and if home treatment fails to arrest it, no time should be lost in obtaining skilled help. Loss of blood may be rapidly fatal, or if not fatal, it may lay the foundation of a subsequent condition of weakness, local and general, which may require years to set right. If the home treatment is successful, the woman must be careful to rest in bed for some few days after all hæmorrhage and pain have ceased. The food must be light and easy of digestion, and great cleanliness observed. Getting about too soon after an abortion is the cause of many of the ailments from which women so frequently suffer. The loss of blood must be made good by nourishing food and fresh air.

As means of prevention, all sudden exertion of the body, such as jumping, lifting heavy weights, riding on horseback or in a jolting carriage, or agitation of the mind must be avoided; strong purgatives should not be taken, and endeavour should be made to live an unexciting and quiet healthful life, which should include a moderate amount of exercise in the open air. After one abortion, great care must be observed, as a "habit" of aborting may very easily be set up.

MOLE on the skin is a patch of skin coloured brown and often hairy that dates from birth. The best treatment, if any is adopted, is destruction by the electric cautery. The hairy brown patch is then replaced by a scar, which is less conspicuous.

The term is also used to denote any semi-solid body discharged from the body, e.g. a blood clot, etc.

MONKSHOOD or **ACONITE,** known also as blue rocket and wolfsbane, is a common poisonous plant. [Refer to *Poisonous Plants.*]

MONOMANIA—madness on one point only. [See *Insanity.*]

MORPHIA—the alkaloid which is the chief ingredient of opium. [See *Opium.*]

MORPHINE is the active ingredient in opium.

MORPHINOMANIA. See *Opium-eating.*

MORTIFICATION—local death. [See *Gangrene.*]

MOTIONS—the *fæces,* or discharge from the bowel. The following variations occur. The quantity is increased by a vegetable diet, by previous constipation, by deficient digestion, as in jaundice, and in many forms of diarrhœa. The colour is lighter on a milk diet, browner on a meat one; iron and bismuth blacken the motions, and rhubarb and senna stain them yellow. Green "stools" point to fermentation in the intestine; very light drab stools to deficiency of bile, very dark brown stools to excessive discharge of bile, and tar-like stools to the admixture of blood at some distance from the anus, whilst bright red blood on the motions points to some source of bleeding near the anus. A slightly sour odour is normal in an infant on the breast, but any odour strikingly offensive points

to indigestion. In typhoid fever and in diseases of the rectum the stools are offensive. Liquid stools occur in the various forms of diarrhœa. In the worst forms, e.g. that of cholera or arsenical poisoning, the motions are like water. In typhoid fever they have the consistency of pea-soup. Very hard and dry motions point to constipation, even though liquid motions alternate with them, as the latter are then probably caused by the irritation due to the former. The passage of motions, as narrow as a pipe-stem, may be caused by stricture of the rectum. Abnormal ingredients include undigested curds, slime, matter, blood, worms. [Refer to *Worms.*]

MUCOUS MEMBRANE is the lining of all internal passages that communicate with the exterior, e.g. stomach, windpipe, or bladder.

MUMPS is an infectious disease due to a germ which has not been discovered at present. Infection occurs by direct contact of the sick with the healthy, but not by means of infected clothing. For the age most liable to attack, the incubation and quarantine periods, refer to the Table under *Fever.* The *symptoms* begin with fever, followed in a short time by inflammatory swelling of the salivary gland, known as the "parotid" which is situated in front of the ear and just behind the jaw. As a rule only one side is attacked. In opening the mouth pain is caused by the pressure of the jaw on the inflamed gland. The attack lasts about a week and recovery occurs without exception. The only complication of importance is inflammation of the testicle in boys and, of the breast in girls. This complication is rare but demands attention if it occurs. The *treatment* is isolation from all under twenty years of age, with confinement to bed while the temperature is raised. The swollen face should be wrapped in cotton-wool or flannel. A chlorate of potash gargle should be used every few hours, but no other medicine is needed. The diet is necessarily a spoon one, owing to the pain of mastication. The complication above mentioned should be watched for, and when present at once reported to the doctor.

MUSCLES are of two kinds. Those under control of the will, or voluntary muscles, and those not under the control of the will, or involuntary. Muscles possess the power of "contracting," that is of shortening and at the same time widening. They contract in response to a stimulus, which normally is a nerve impulse transmitted along the nerves from the brain and spinal cord. The force with which a muscle contracts varies with its bulk in cross section but not with its length. It also varies with training and state of health, and is widely different in different people and in different animals. Thus insect muscle, bulk for bulk, is much stronger than that of most animals. Muscles may be attached to bone at each end. When they contract the two bones are drawn together. Usually one bone only moves, the other being fixed; for instance, the biceps bends the elbow joint by raising the forearm to the upper arm. Those muscles which are not thus attached to bone are usually circular, and by contracting narrow the organ they encircle. Thus the chambers of the heart are surrounded by muscle, which by their contraction empty the chambers of blood at each beat; again, the intestines are surrounded by muscular walls which propel the food along them. [Refer to *Training.*]

MUSHROOMS are dark brown on the under side, the upper side peels, and the odour is pleasant. Poisonous fungi are often mistaken for them.

MUSSELS are very indigestible, and if not quite fresh are poisonous.

MUSTARD is a useful counter-irritant when applied externally, though care is required in the case of children, as their skins blister easily. A mustard poultice or mustard leaf, when applied over the seat of pain in pleurisy, neuralgia, rheumatism, and so on, often gives relief. A mustard leaf should be dipped in tepid water and applied with a layer of muslin between it and the skin. Such a leaf applied to the pit of the stomach, to the left of the midline, often checks vomiting. A mustard poultice should be made in the way described under *Poultice.* A mustard bath (twelve ounces of mustard to sixteen gallons of water) may be used in the treatment of common colds, either the feet only or the whole body being immersed for ten minutes if it can be borne, and the patient then dried rapidly, wrapped in flannel, and put to bed. Taken internally, mustard is a useful emetic, the best dose for this purpose being a tablespoonful of mustard in a tumbler of tepid water.

MUTTON BROTH, often useful as an alternative to beef tea, is made as follows:—

> Ingredients required—one pound scrag end of mutton, one quart of water, one dessert-spoonful of pearl barley or sago, one teaspoonful of chopped parsley, salt to taste. Cut up the meat and remove the fat, put in a saucepan with the water and warm up slowly till it boils. Then skim and add the barley or sago and allow to simmer for three hours, again skim, and add the parsley. For invalid purposes the skimming must be thorough. The addition of carrots, turnips, celery and other vegetables to the meat is often desirable.

MYOPIA is short sight. See *Sight.*

MYXŒDEMA. See *Cretin.*

NÆVUS is a birth-mark, which see.

NAILS are formed from the horny layer of the skin. At the root of the nail the skin is folded back on itself so that two layers are facing each other with the nail between them. At this point the nail grows by the addition of horny matter from above, below, and behind, and it continues to receive additions on its under surface until the nail projects beyond the finger. The nails should be cleansed by the nail brush and soap only. Toe-nails should be cut square, finger-nails with the corners slightly rounded. If the nails be cut to any extent down the sides, ingrowing toe-nail results. The nails are curved in consumption and heart disease. They are fissured throughout their length in gout, furrowed across after fever, and dry, lustreless, discoloured, and fissured when attacked by ring-worm. [Refer to *Ingrowing Toe-nail.*]

NARCOTICS are drugs which depress the nervous system as a whole. Hypnotics, on the other hand, produce sleep without affecting the nervous mechanism of respiration, circulation and digestion, and are consequently less dangerous. Chloral, opium, hyoscine are examples of narcotics. They are used, under medical advice only, to secure sleep, when the hypnotics, e.g. bromide, fail. [Refer to *Poisons.*]

NASAL-DOUCHE is a mode of washing out the nose. A stream of fluid is injected into one nostril, whilst the mouth is held open, and the fluid returns, after a little practice, through the opposite nostril. The fluid may be injected by a syringe or from a douche can held about the level of the patient's eyes. Much force should be avoided. The fluid must be at blood heat. The best douche to use as a rule is made by adding a teaspoonful of salt to the pint of water, or by using the following powder:—

> Bicarbonate of soda, borax, and salt, of each one drachm, white sugar two drachms. One teaspoonful in half a tumbler of warm water. If an antiseptic is required boric lotion should alone be used.

NAUSEA is the feeling which precedes vomiting, which see.

NECK. See *Stiff Neck, Wry Neck.*

NECROSIS. Death of bone. [See *Bone Disease.*]

NEPHRITIS, the general term for various forms of inflammation of the kidney.

NERVOUS DISEASE includes many diseases which fall into two main groups: (1) those due to alteration in the structure of the nervous system; (2) those due to alteration in the mode of action of the nervous system without any change in structure. The prospect of recovery in the first group is necessarily bad, though often the functions of the diseased part can ultimately be undertaken, partially at least, by other parts of the nervous system. The prospect of recovery in the second group is much better. Group (1) includes general paralysis of the insane, many forms of idiocy, strokes, locomotor ataxy, infantile paralysis, progressive muscular atrophy, tumours of the brain, etc. Group (2) includes St. Vitus's Dance, habit spasm, hysteria, writer's cramp, many forms of tremor, many forms of

insanity and epilepsy. Nervous disease is always increased by civilisation. Roughly speaking, we may say that the chief cause of group (1) is intemperance, using that term in its broadest possible sense; and of group (2) is heredity. [Refer to *Brain*, *Insanity*, and the *separate headings*.]

NERVOUS EXHAUSTION, or *Neurasthenia*, is debility in which lack of vigour in the nervous system is the cause. Nervousness is one of the chief symptoms. [Refer to *Debility*.]

NERVOUS SYSTEM consists of a brain and spinal cord from which branches or nerves are given off that supply all parts of the body. The brain and spinal cord form the central nervous system, and the nerves the peripheral nervous system. The central nervous system is protected by a bony sheath, the skull and backbone, and further within this by a fibrous sheath and a water bed. The peripheral nervous system is only protected by the fibrous sheath, though the larger nerves are so situated as to be as little exposed to injury as possible. The nerves are composed of nerve fibres, which either transmit motor impulses from the brain and spinal cord to the muscles, and thus effect movement, or they transmit sensory impulses from the skin and organs towards the brain and spinal cord and give rise to sensation. Thus nerves are distinguished as motor nerves and sensory nerves. Most nerves contain both kinds of fibre, and are thus "mixed nerves." [Refer to *Brain*.]

NERVOUSNESS is a symptom of weakness. In this condition external stimuli produce more effect on the emotional side of the mind than is normal. The causes are numerous. A highly strung nervous temperament is often inherited and, so long as the general health is well maintained, is an advantage, for such people are usually clever. Over work, excitement, lack of sleep, indulgence, especially in "the three domestic poisons"—tea, tobacco, and alcohol; want of fresh air and constipation are all causes of nervousness. The treatment is the detection and removal of the cause. Tonics may be required, arsenic being often beneficial, but alcohol should be avoided.

NETTLE RASH, or Urticaria—from *urtica*, a nettle—is an eruption consisting of weals that come and go, accompanied by itching and burning and often swelling; in appearance it resembles the rash caused by the stinging-nettle. The *cause* is a disturbance of the nervous control of the blood-vessels in the skin. Many people inherit a tendency to the condition on the slightest irritation. The irritation of flannel garments, sweat, or of a flea-bite may produce a wide-spread eruption. More often an attack is induced by irritation in the stomach and intestines, brought on by constipation, and the consumption of certain articles of diet, e.g., shell-fish and strawberries.

In childhood papular urticaria is common. The weals in such cases are scanty and easily overlooked, and the rash consists mainly of red, hard pimples. The disease, however, is really the same. The *treatment* is to detect and remove the chief cause of irritation. Mental worry, stomach trouble, and clothing should receive special attention. Instead of flannel being worn next the skin, it should be worn over silk or cotton. A daily bath also will prove beneficial.

Grey powder for a child, and some mild aperient for an older person, should be taken and dietetic indiscretions avoided. The itching caused by the rash should be relieved by lead lotion, or by creolin (a teaspoonful to the pint of water). The use of a flesh brush will also be useful, scratching should be avoided, and pressure with the finger-tips substituted for it.

NEURALGIA, literally pain in a nerve, is a symptom of some disturbance, at present unknown, to which sensory nerves are liable. The nerves most commonly attacked are those of the face, the ribs, the loins, and the back of the thigh. The pain is of a most intense character; it comes and goes, often without apparent cause, affecting only one side at a time, and is not accompanied by any rise of temperature.

The *cause* may be disease of the bone through which a nerve passes; the pain in such a case is not felt at the bone, but at the extremities of the branches of the nerve. Disease of the back-bone should thus be borne in mind as a possible cause. In facial neuralgia, the ear, the eye-sight, the teeth, and, especially the wisdom tooth, require careful examination, though many cases have occurred in which tooth after tooth has been removed by a dentist without relief having been obtained. It is therefore wise to consult a doctor before submitting to the removal of sound teeth. Exposure to cold and damp often determine an attack. Neuralgia is also common in the course of certain diseases, e.g., malaria, Bright's and diabetes.

The *treatment* should be the improvement of the general health. Regular habits and a course of tonics, e.g., iron, arsenic, quinine and the hypophosphites all do good in certain cases. A country holiday is still better; the seaside, however, is not recommended. Remedies for the relief of the pain itself include gelsemium, butyl chloral hydrate, antipyrin, phenacetin, valerian, ether. Morphia and alcohol are dangerous. A liniment may be rubbed or painted on the painful area, e.g., the liniment of aconite, belladonna and chloroform in equal parts often termed the a, b, c liniment; menthol and cocaine, menthol and chloral, chloral and camphor are also used as liniments. Fomentations sprinkled with laudanum or belladonna glycerine may be tried, or a ginger poultice or blister may be applied. Galvanism has a temporary soothing effect. Finally, removal of the roots of the nerve attacked may be submitted to under anæsthetic, or hypnotism may be resorted to if the above methods have failed.

NEURASTHENIA, or Nervous Exhaustion. See *Debility*.

NEURITIS is inflammation of a nerve or nerves. It may be due to one of many causes, e.g. chill, injury, poisons, or germs. The diagnosis and treatment make a doctor essential.

NEUROSIS is a nervous disorder due to a disturbance in the normal working of the nervous system, but not to any morbid change of its structure, so far as present methods of research can discover. Neuralgia, hysteria, and some forms of insanity are examples.

NICOTINE is the most powerful ingredient in tobacco. In its pure form nicotine is a poison. [Refer to *Smoking* and *Poisons*.]

NIGHT-DRESS. It is best made of a mixture of wool and cotton. It is important to clothe young children, most of whom kick off the bed-clothes at night, in "combination sleeping suits."

NIGHT-MARE and **NIGHT-TERRORS.** See *Dreams*.

NIGHT-SHADE. The common shrub of the hedge-row is not the deadly night-shade, but the woody night-shade, and the berries, though poisonous, are much less so than are those of the rarer species. [See under *Poisons, Belladonna*.]

NIPPLE-SHIELDS may be used when the flatness of the nipple prevents the child from grasping it. They must be kept scrupulously clean.

NITROUS OXIDE. See *Anæsthetics*.

NODE is a small tumour due to inflammation of the periosteum or membrane that lines a bone. The shin is the common position. Syphilis or tuberculosis are the chief causes. The treatment should be in medical hands.

NOMA. Gangrene of the cheek or privates, seen in the starved children of the slums after measles.

NOSE is a cavity bounded below by the palate, above by the base of the skull, in front by the nasal bones and cartilages, whilst behind it opens into the upper part of the pharynx or throat. The cavity is lined by a mucous membrane, which secretes mucus and thus keeps the membrane moist. The nose is divided into a right and a left half by a partition, the "nasal septum." Each half is occupied by the three turbinal bones, which run horizontally from front to back, each being rolled up like a scroll. Below each bone is a space, which gives passage to the air. The purpose served by the turbinal bones is to increase the surface of mucous membrane to which the air is exposed in

order that it may be filtered, moistened, and warmed before reaching the lungs. The two upper turbinals are supplied with the nerve of smell, hence in order to smell, a slight sniff is given to draw the air into the upper portion of the nose. When the lining membrane is swollen during "a cold," the sense of smell is impaired, because the air does not then readily gain entrance to the upper part of the nose. The lachrymal duct carries the tears from the eye to the nose, and certain air-spaces in the skull and upper jaw, termed the accessory sinuses, also open into it. Hence a "cold" may spread to these and cause watering of the eye, pain over the brow or in the upper jaw.

In the case of any foreign body in the nose, as so commonly happens with children, the *treatment* is as follows:—Blow the nose with the nostril on the unaffected side firmly closed. If this fails, sneezing may be induced by the application of snuff to the nostril of the unaffected side. If these simple methods fail it is advisable to consult the doctor. If none is obtainable, warm water containing a teaspoonful of salt to the pint, should be snuffed up the nose, or it may be injected from a syringe into the nostril of the unaffected side, whilst the mouth is held open. Finally, a hairpin with the round end foremost may be passed into the nose beyond the body, and the two may then be withdrawn together. In unskilled hands, however, this manœuvre usually results in pushing the body further in or in making the nose bleed and thus obstructing the field of view. The patient should be seated, facing a good light, with the head well back, resting on the back of the chair, and preferably kept in position by an assistant. It must be borne in mind that the direction of the air passages in the nose is towards the ear, and not upwards, as commonly thought. If neglected, a foreign body may cause a fetid discharge from one of the nostrils. *Broken Nose* is not a rare accident in boxing or Rugby football. The symptoms are change in the shape of the nose and nose bleeding. The treatment is best in medical hands. The deformity may be corrected in part by the introduction of a pen-holder, padded with part of a clean handkerchief, and the elevation of the depressed bone by this instrument, aided by the fingers used externally.

Diseases of the nose include overgrowth of the turbinal bones, the growth of spurs from the septum, ulceration due to syphilis or lupus, the formation of polypi or stalked tumours in the nose, and atrophy of the lining membrane, a condition termed atrophic rhinitis. Spurs in the septum and enlarged turbinals block the air passage and promote mouth breathing. These defects can be remedied by surgical means. [Refer to *Colds*, *Hay Fever*, *Nasal Douche* and to *Nose-Bleeding* under *First Aid*.]

NURSE. A *hospital-trained nurse* is often invaluable, as there are many details of sick room management which require a practised hand. The reluctance of the public to call in a trained nurse is remarkable, but once the prejudice has been overcome, there will be but little hesitation in the matter in future illnesses. The *monthly nurse* should be a certificated midwife, preferably one who is a "Licentiate of the Obstetrical Society," indicated by the letters L.O.S. A *wet nurse* should always be chosen by the doctor, as it is essential that the nurse should be in sound health with breasts suited to suckling. The woman chosen should have a healthy child a little older than the baby she is to nurse. She should rise early, have a walk daily, and do some housework. Her diet should be plain and ample, and contain plenty of milk, whilst the taking of stimulants should be discouraged. There is a wide-spread belief in stout, which has but little, if any, foundation in fact. The bowels should be kept regular, without resort to strong aperients, which are apt to affect the milk. The temper should be kept as quiet as possible, as fits of passion affect the milk seriously. [Refer to *Sick Room*, *Child-Birth*, *Infancy*.]

NURSING. See *Sick Room*.

NURSING INSTITUTIONS. A list is given in the "Medical Directory."

NUTMEG contains a volatile oil that stimulates digestion. It is used in cooking. Spirits of nutmeg, the dose of which is from a half to one teaspoonful, is used to treat flatulence. In large doses nutmeg is poisonous.

NUTS contain either starch or vegetable oil. They are nourishing if they can be digested.

NUX VOMICA is the bean from which the alkaloid strychnine is obtained. [See *Poisons*.]

OATMEAL is to many people indigestible, though very nourishing if it can be digested.

OATMEAL WATER is made by placing a handful of oatmeal in a muslin bag and allowing it to soak in a gallon of water for an hour and then boiling for twenty minutes. The upper portion is then poured off gently. Oatmeal water is useful for cleansing the skin in eczema or infancy.

OBESITY, literally "on account of eating"—is the term used to denote an undue accumulation of fat in the body. The causes of obesity vary: heredity is responsible in some cases, but unsuitable diet in most cases. Thus the rickety child fed on a tinned food instead of on the breast is often very fat, and often wins the prize at a baby's show, as Dr. Cheadle has pointed out. The anæmic shop-girl, whose mid-day meal is tea and buns instead of meat, is often fat. The heavy beer drinker is usually fat. Many other examples of the relation of unsuitable diet to obesity will occur to the reader. Mental inactivity promotes it, as is seen in many idiots. On the other hand, great mental activity, as in acute mania, or even in business worries, is attended by loss of flesh.

To those approaching middle age who incline to be stout, our advice is take it in time, and, without resorting to any violent treatment for reducing weight, so alter the daily habits that gain in weight is kept well in check. However good Shakespeare's advice may be to have men about one that are fat, it is well to be oneself lean, for "obesity is not only a disease in itself but the harbinger of others," as Hippocrates taught long ago. The action of the heart and lungs become embarrassed, and the difficulty of taking the exercise necessary to health is great, if with advancing years, as the muscular power declines, the weight steadily increases. The golden rules are:—

> (1) Drink little; forego alcohol, especially beer and port, and avoid cocoa. Take a little hot water half-an-hour before meals, and but little fluid at meals. (2) Eat less, avoiding especially the starches and sugars which are more fattening than fat itself. Such articles of diet as peas, potatoes, pastry, new bread, puddings, and marmalade should be given up; and greens, toast, rusks, biscuits, and fruit substituted. Fish, flesh, and fowl, and butter in moderate quantities may be taken, but not duck, goose, herring, sardines, or thick soups. (3) Improve the general health by fresh air, more exercise, cold baths with brisk friction afterwards, and attention to the bowels. Turkish baths, though useful in some cases, should be taken by medical advice only. (4) Avoid all drugs, vinegar included.

Severe measures, such as banting, the Salisbury treatment, and other modes of reducing fat are only safe under medical supervision, and are best carried out at a Spa, e.g., Carlsbad, Marienbad, or Homburg, at which regular courses of treatment are given, often with much benefit.

ŒDEMA is the technical name for dropsy beneath the skin.

ŒSOPHAGUS is the gullet, which see.

OIL presents many varieties with very different effects on the body. They are divided into the fixed or non-volatile oils, and the volatile or essential oils. The *fixed oils* include animal, vegetable and mineral oils, of which the two former, with few exceptions, act as food, being stored in the body as fat and used up when required to produce heat; whilst the last or mineral oil, e.g., petroleum, has no such action. Cod-liver and olive oils are examples of the former class. As a rule the animal oils are digested more easily than the vegetable oils. In the course of digestion they are broken up into minute droplets, that is, they are emulsified. Hence artificially emulsified cod-liver oil is more suitable to those of feeble digestion than the natural oil. Several oils contain additional ingredients, which possess actions of their own. Thus castor oil and croton oil contain purgative agents. Castor oil is one of the best

aperients we have; croton oil, on the other hand, is the most violent and is only used on rare occasions by medical orders.

The *volatile oils* include a large number which give rise to the characteristic odours of flowers, spices, pinewoods, etc. They do not act as food, but are readily absorbed into the circulation and are as readily expelled by the kidneys and the lungs. Hence they may be used either for their action on the digestive organs, or for their action, after absorption, upon the lungs or kidneys. Those used for their action on digestion include oil of peppermint, cloves, cinnamon and cajuput. The pure oil would burn the tongue, so that they are either used dissolved in spirit or are taken on sugar. Their chief use is to aid digestion and to dispel flatulence. The volatile oils employed to disinfect the urine include oil of sandal wood and cubebs, and those that increase the blood supply to the kidney and promote the formation of urine are juniper, turpentine, and cantharides. Unfortunately these oils irritate the kidneys, and are thus not a wise remedy in kidney disease. Juniper in the form of gin is widely used and does much harm. The oils used to disinfect and diminish the amount of phlegm produced in the lungs and air passages include turpentine, terebene and oleum pini. Certain oils are sufficiently irritating to produce redness and blistering of the skin, and are used as counter-irritants to be applied over deeply-seated inflammation; for example, turpentine, mustard, and cantharides.

The volatile oils readily oxidise to form a resin. The solution of a resin in a volatile oil is an oleo-resin. The oils are frequently prepared from oleo-resins by distillation, when the oil distils over, and a residue consisting mainly of resin is left. Thus crude turpentine is the oleo-resin from which oil of turpentine and common resin are prepared by distillation.

OINTMENT is a mixture of an active substance with a fatty basis. It is important that the fat should not turn rancid, as it is then irritating and offensive. Some antiseptic, especially benzoic acid, is combined with the fat for this reason. Thus benzoated lard is very commonly used. Vaseline, which keeps fresh without a preservative, is also widely used. Lanoline, a purified fat obtained from wool, is another useful one, though irritating to some skins, whilst recently a cocoa-nut fat sold under the name *albene* has been introduced. Spermaceti, a fat derived from the whale, is not so much used as formerly, though a combination of beeswax, spermaceti, almond oil and rosewater forms the well-known "cold cream."

Ointment is bad for healthy skins, as it hinders perspiration, and it should, on this account, be applied strictly to the affected region only. The purpose served by the fat is that it softens and penetrates into the skin, carrying in also the ingredients that are mixed with it. Ointment may be applied by rubbing it in or by spreading it on cloth or lint, and binding this on. It may be used when:—

(1) The skin is too dry, as in chaps	Boracic ointment rubbed in.
(2) The skin is abraded or raw	Zinc ointment or vaseline on lint.
(3) A chronic ulcer is present	Yellow oxide of mercury ointment.
(4) The skin is inflamed	Cold cream (without any bandage or lint).
(5) Mattery heads are present	White precipitate ointment.
(6) There are parasites in the skin, e.g., itch or ringworm	Sulphur ointment.
(7) There is a scaly rash	Tar ointment.
(8) There is itching of the skin	Carbolic ointment or lead ointment diluted with zinc ointment in equal parts.

In acutely inflamed conditions of the skin, lotions as a rule act better than ointments. Cold cream is then better borne than most ointments. When the eruption is accompanied by much "weeping" of the skin, a paste is better than a pure ointment. Pastes are made by adding to the ointment flour, starch, or other powder that can absorb moisture. Thus a *paste* is made of zinc oxide, starch, lanoline and vaseline in equal parts. In the treatment of clean cuts, clean linen rag is better than ointment.

OLIVE OIL, known also as salad or sweet oil, forms a useful lubricant in massage. It is used to smear the surface of a linseed poultice to prevent it sticking, also to apply to burns to keep out the air, and to drop into the ear to soften hardened wax. It is not much given by the mouth, but forms a valuable enema in cases of fæcal impaction.

OPHTHALMIA. Inflammation of the inner surface of the eyelids. [See *Eye.*]

OPHTHALMOSCOPE is an optical instrument used to inspect the interior of the eye.

OPIUM is the dried juice of the white poppy. It contains morphine, codeine, resin, and other bodies. The drug is contained in a great number of preparations, such as:—

PREPARATION.	DOSE FOR AN ADULT WITH NORMAL LIVER AND KIDNEYS.
Powdered Opium	½–2 grains.
Laudanum or Tincture of Opium	5–15 minims.
Battley's Solution or Liquor Opii Sedativus.	5–10 minims.
Dover's Powder	5–15 grains.
Paregoric	½–1 drachm.
Nepenthe	5–15 minims.
Lead and Opium Pill	2–4 grains.
Compound Soap Pill	2–4 grains.

Morphine or morphia, which is the body to which the value of opium is mainly due, is isolated from the other ingredients and used in the following well-known preparations:—

PREPARATION.	DOSE FOR AN ADULT WITH NORMAL LIVER AND KIDNEYS.
Compound Tincture of Chloroform and Morphia	2–15 minims.
Chlorodyne	2–15 minims.
Liquor Morphinæ	10–60 minims.
Injectio Morphinæ Hypodermica	2–5 minims.
Morphia and Ipecacuanha Lozenges	1 lozenge.
Morphia Suppository	1 suppository.

From opium *codeine* is isolated and, in doses of ½–2 grains, is used in the treatment of diabetes. *Heroin* has been prepared recently and is of some service in checking a dry cough. In addition to the above well-known preparations of opium, most of the syrups for "soothing" infants contain a certain amount of opium, and should therefore be guarded against. It cannot be too clearly understood that no preparation of opium should be given to a child except by medical orders. Infants are readily poisoned by minute doses of this drug. It is much to be regretted that many of the preparations of opium are sold without the nature of their contents being plainly stated on the label. Such preparations are largely used by people of the working class to keep the baby quiet whilst the mother goes out to work. "There is no doubt that great numbers of infants perish every year in this country through the improper use of quack remedies containing opium," says the writer in Quain's Dictionary of Medicine. And again, "More than half the deaths by poison which occur in England and Wales are due to opium and its preparations . . . which are much given to infants and young children," write Guy and Ferrier in "Principles of Forensic Medicine."

The *action of opium.* It relieves pain slightly when applied to the skin. On entering the stomach it relieves pain there, but afterwards promotes nausea and vomiting. In the intestine it relieves colic and diarrhœa, but if there be no tendency to diarrhœa it causes constipation. Hence the effect of opium on the normal digestion is to disturb it, and it is for this reason that morphia is so often adminis-

tered by hypodermic injection. Some of the preparations of opium and morphine, e.g., nepenthe, have a less disturbing effect on the digestion than most of them. After absorption into the circulation, opium produces a marked effect on the nervous system. It is at first a soother of pain and a stimulant, causing a feeling of well being and a brilliancy of imagination, which is the cause of the vice of opium eating. The stimulant effect soon passes off and is succeeded by sleep, which may deepen if the dose is sufficient, into a condition of stupor. In stupor, the patient cannot be aroused, the breathing is slow, the extremities cold, and the pupils very small. Death may result from failure of respiration. The sleep produced by opium is rarely a natural one, and on waking unpleasant after effects, e.g., nausea and headache, are frequent. However, when lack of sleep is caused by pain, opium, in medical hands, is of great service. By soothing the nervous system, opium is also useful in checking a dry, hacking cough. It should not be used when the cough is loose, or the cough will be checked, and the phlegm accumulate in the air passages to a dangerous extent; but for a dry cough it is invaluable. Opium also acts on the skin, promoting perspiration, and is thus useful in the form of Dover's Powder at the onset of a cold. The action of opium is due mainly to the morphia it contains. Codeine relieves cough and pain to a less extent than morphia, but it checks the excessive formation of sugar that occurs in diabetes, and is used for this purpose. Morphia is often given combined with atropine, as the latter combats many of the ill effects of the former without reducing its power to relieve pain.

N.B.—Old people stand opium well, but the victims of liver or kidney disease are easily poisoned by small doses, and, like young children, should never be given opium or morphia without medical orders [Refer to *Poisons*].

OPIUM EATING and morphinomania is a vice more prevalent than is generally known. The craving for this drug, though it is often indulged for some time before the health is seriously affected, sooner or later ends in mental, moral, and physical degeneration. The amount of the drug taken is steadily increased till as much as a pint of laudanum has been known to be taken daily. At present the hypodermic injection of morphia is a common way of taking the drug. The danger of acquiring a craving for the drug must be borne in mind by all who resort to it for the relief of pain or sleeplessness, and if a doctor can possibly be obtained, it should never be taken except by medical orders. Victims of the habit can be cured if they will put themselves under medical care in a suitable nursing home, but they can seldom be treated successfully in their own home.

OPSONIN is a new term introduced by Dr. Wright, who has demonstrated that certain chemicals are formed by the blood which so enfeeble any microbes present that they fall an easy prey to the subsequent attack of the white blood corpuscles. These chemicals he has named *Opsonins*, literally "that which cooks or prepares a feast" for the white corpuscles. It is now possible to measure the amount of opsonin that the blood is producing at any given time, and thus one can say when there is the least possible risk of an operation being followed by blood-poisoning. Some surgeons already have turned this fact to account in their practice. When the opsonins are not present in the normal amount, they can be increased by doses of suitable vaccines. This method is now being given an extensive trial in the treatment of tuberculosis, and many other diseases.

OTORRHÆA is a mattery discharge from the ear, a condition which it is dangerous to neglect.

OXYMEL is composed of clarified honey eight parts, acetic acid and water of each one part. The dose is one to two teaspoonfuls. It is used to relieve soreness of the throat.

PACK. See *Baths*.

PAIN is essential to life. When the sensation of pain is cut off from any part of the body, by division of the nerves coming from it, sores are apt to form on the skin in that region. This is due to the fact that the skin, thus rendered free from pain, is no longer guarded from injury due to pressure, friction and the like, and ulceration results. In the same way ulcers form on the eye, if this is incapable of appreciating the presence of dust, and blindness is the result. Again, in inflammation, the first essential to recovery is rest of the inflamed part. There could hardly be a more certain method of securing rest than the process by which movement of an inflamed organ causes pain. The chief symptom that draws the sufferer's attention to the fact that something is wrong and which compels him to seek treatment is, as a rule, pain. As so often happens in nature, however, the great benefit the majority of the race receives is coupled with disastrous consequences to a minority. Pain that is ceaseless, that prevents sleep, destroys appetite and renders life a continuous burden, is in itself a distinct menace to life, and calls for energetic measures to suppress it, when its cause cannot be removed. As a rule, on the other hand, the cause of the pain should be removed, and not the pain suppressed whilst the cause is ignored. The treatment for pain then varies widely with the cause, and no universal panacea can be here recommended. The drugs used for suppressing pain are termed anodynes, of these morphia is the most potent, and is invaluable in the treatment of those dying of a painful and incurable disease, but it is obviously not a drug for domestic use. [Refer to *Anodynes, Colic, Headache, Lumbago, Neuralgia, Teeth*, etc.]

PAINTER'S COLIC. See *Colic*.

PALATE, CLEFT. See *Harelip*.

PALPITATION of the heart is present when the beating of the heart makes itself felt. The chief *causes* are sudden emotion and indigestion, especially acidity with flatulence. The *symptoms* are either attacks of frequent and irregular action of the heart with a feeling of fluttering in the chest, or a more forcible action in which the whole chest may feel shaken. These symptoms are accompanied by giddiness, anxiety, pain in the chest, and other symptoms. They are apt to come on at night and awake the sufferer from his first sleep. The *treatment* during an attack should be a dose of bicarbonate of soda, one to two saltspoonfuls taken in some hot peppermint water, or a teaspoonful of sal volatile in half a tumbler of water. Between the attacks the causes of indigestion should be avoided, especially heavy and late suppers, tea, tobacco, rich and sweet food, constipation, etc. There is no ground for fearing the heart is diseased, it is the stomach that is out of order.

PALSY. See *Paralysis*.

PANCREAS, or Sweetbread, is a digestive gland, situated behind the stomach, which pours its secretion, or pancreatic juice, into the small intestine. The juice acts on meat, fat, and farinaceous food, and is a most important digestive agent. The active ingredient has been extracted and administered in those cases of indigestion in which bread and farinaceous foods disagree. For this purpose the pancreatin must be protected from the stomach juices by administration in capsules coated with keratin. The keratin does not dissolve until the small intestine is reached. In the opinion of most authorities, however, it is better in such cases to predigest the food by the use of liquor pancreaticus. Liquor pancreaticus is a liquid containing the active ingredients of the fresh pancreas of the pig, and a small quantity mixed with milk, gruel or soup and kept at blood heat renders the food much more easily digested. This method is termed peptonisation or pancreatisation [For details see *Peptonised Food*]. But little is yet known of the symptoms of pancreatic disease, though knowledge is being gained daily. The pancreas may be the site of cancer and of the formation of tumours that are known as pancreatic cysts. In addition to the formation of pancreatic juice, the pancreas pours into the blood a fluid that regulates the consumption of sugar by the muscles. If the pancreas fail in this duty, one form of diabetes is the result.

PARALYSIS may attack the power of motion or sensation, or both. The causes include hysteria, certain poisons (e.g., alcohol, lead, and the poisons of certain fevers), and disease or injury of the brain, the spinal cord, or the nerves, and more rarely the muscles. Of these, the first two causes

are the most likely to cause only temporary paralysis. The treatment adopted is to prevent the paralysed muscles from wasting as much as possible, whilst the injured part of the nervous system is recovering. The methods in vogue for effecting this purpose are electricity and massage. A paralysed limb must be kept warm and scrupulously clean. Care is necessary that it is not injured by the pressure of a boot or other article of clothing, and that it is not burnt by a hot bottle, as any sore that is produced will heal slowly, if at all. [Refer to the separate headings of the *Nerve Diseases.*]

PAREGORIC. See *Opium.*

PATELLA. The knee cap. See this *Heading.*

PATENT MEDICINE has to pay duty to the Government, and bears the Government stamp to show that the duty has been paid. The public often mistake this stamp for a guarantee from the Government that the virtues claimed by the Patent medicine are genuine. In reality it has no reference whatever to the nature of the medicine. Many of the Patent medicines applied in suitable cases are good remedies, others are pure frauds. A valuable pamphlet by Dr. R. Hutchison, on "Patent Medicines and Patent Foods," has been recently published, giving the composition of all the better known patent remedies, and we heartily recommend it to any one interested in this subject.

PATHOLOGY is the science that treats of the changes which occur within the body as the result of disease. In other words it is the Physiology of morbid processes. It is the rational basis for scientific treatment.

PEPPER. Powdered black pepper may be used to relieve flatulence and the itching caused by piles. For this purpose the dose is five to twenty grains. It may also be taken in the form of confection of pepper (dose, one to two teaspoonfuls). The confection is prepared from powdered pepper two parts, caraway three parts, clarified honey sixteen parts, the three ingredients being rubbed up together. Cayenne pepper is also used to relieve flatulence, being most conveniently taken in the form of tincture of capsicum (dose, three drops).

PEPPERMINT is largely used to disguise the taste of other drugs and to relieve flatulent dyspepsia. There are several preparations of this drug:—oil of peppermint, dose, one to four drops on sugar; peppermint water, dose, two to four tablespoonfuls; essence of peppermint, dose ten to twenty drops in water; and spirits of peppermint, dose, one quarter to half a teaspoonful in water.

PEPSIN is the active ingredient of the stomach juice, which digests meat. It is obtained from the stomach of the recently killed pig or calf as a glycerine extract. This extract is administered as an aid to digestion in many forms of indigestion, especially those associated with dilatation of the stomach. The dose used is one to two teaspoonfuls of the glycerine extract. Pepsin lozenges are also used.

PEPTONE is the body produced by the digestion of meat and other proteids.

PEPTONISED FOODS are those which have been partially changed to peptone by artificial means before they are eaten. This change renders them more easily and quickly digested, and is of great service in many forms of indigestion; it is also of great use in the preparation of nutrient enemata, as the lower bowel has a very feeble digestive power of its own. The active ingredient of the digestive juice of the stomach —or pepsin—is rarely used for this purpose, as it only acts on acid food, and most food is alkaline. The active ingredient of the pancreas—*pancreatin* or *liquor pancreaticus*—acts only on alkaline food, and is thus the one used, especially as this acts on all kinds of food stuffs. To peptonise food:—

> The food must be rather above blood heat. In the case of milk, by boiling half and then adding the cold half the desired temperature may be obtained. To peptonise cornflour or beef tea, after they are cooked allow them to cool till they can just be tolerated in the mouth; a salt spoonful of bicarbonate of soda and two teaspoonfuls of Benger's Liquor Pancreaticus is added to each pint of food. The whole is then well stirred, covered with a tea-cosy, and put aside in a warm place for twenty minutes. At the end of this time it is boiled, and is then ready for use. It should be kept in a cool place, preferably on ice, as it goes sour readily, and must be made fresh every few hours. Instead of Liquor Pancreaticus and bicarbonate of soda, pancreatising powders, e.g., Fairchild's, may be used; one powder is required for each pint of food.

PERICARDITIS is inflammation of the pericardium or membrane round the heart. The chief causes are rheumatic fever and Bright's disease. The diagnosis and treatment require a doctor.

PERISTALSIS is the alternate contraction and relaxation of the walls of the alimentary canal by which the food is kept moving onwards.

PERITONITIS is inflammation of the peritoneum, a membrane lining the abdominal cavity. Chill was formerly thought to be the chief cause of this grave disorder, but it is now well known that chronic peritonitis is mainly due to tuberculosis or cancer, and acute peritonitis to perforation of one of the abdominal viscera, e.g. the vermiform appendix, the stomach, or the duodenum. Hence the treatment of acute peritonitis is operation without a moment's unnecessary delay. By adopting this line of treatment the mortality has been greatly reduced. Formerly it was the custom to give opium and hope for the best, and only to operate as a last resort, that is to say, when it was too late to save the patient's life. The mortality was then exceedingly high. Peritonitis, like many less serious affections, usually begins with vomiting and severe abdominal pains. Hence such symptoms, though probably only due to some trifling cause, should be at once reported to the family doctor, for if due to peritonitis delay may prove fatal.

PERMANGANATE OF POTASH is less useful as a disinfectant than is popularly thought, unless a very strong solution is used, the more recently introduced disinfectants, e.g., Izal, chinosol, and others being better. [See *Disinfectants.*]

PERSPIRATION. See *Sweat.* **PHTHISIS.** See *Consumption.*

PHARMACOLOGY. See *Therapeutics.*

PHARMACOPŒIA is an official list of the drugs and their preparations and doses. The chemist is legally bound to dispense prescriptions in accordance with the Pharmacopœia. Each civilised country publishes its own Pharmacopœia. The British Pharmacopœia first appeared in 1618, and many editions have since appeared in order to keep it up to date. At first most of the formulæ were of Greek or Arabian invention, and many worthless remedies were included; the formulæ were remarkably complex, thus one contained 131 ingredients, and 30 to 50 ingredients were common. The tendency has been in the editions after 1788 to greatly reduce the number of drugs and to simplify the preparations made from them. Digitalis first appears in 1677, ipecacuanha in 1721, quassia in 1780, but morphia, quinine and strychnine do not appear till after 1820.

PHENACETIN is an insoluble crystalline powder. It is most useful in relieving headache, and to a less extent neuralgia. Five grains may be taken in the form of powder or tablet every hour for four doses, if necessary, but not more frequently. Thirty grains in any one day should be regarded as a maximum.

PHLEBITIS is inflammation of a vein. The blood in the vein clots and the limb swells. Rest is essential and a doctor requisite.

PHOSPHORUS exists in two forms, the red variety and the yellow; the latter is highly poisonous, the former inert. By the use of red phosphorus instead of yellow in lucifer match making, the necrosis of the jaw, which formerly attacked the workmen, has now been practically abolished. In the form of phosphate of soda, iron, or calcium, phosphorus is largely used as a tonic. Of these drugs, syrup of phosphate of iron is one of the best: the dose is a half to one teaspoonful in a little water three times a day after food. Children take it readily in full doses. Recently the glycerophosphates have been introduced, and are proving useful. They are taken as a syrup in the same dose as the above. In the form of hypophosphite,

also, phosphorus acts as a tonic, though it is of less value than the phosphates.

PHTHISIS. See *Consumption*.

PICKLES are at times coloured with copper compounds. These, which are poisonous, may be detected by inserting a bright steel knitting needle into the pickle jar fluid. If copper is present it will be deposited upon the needle.

PILES OR HÆMORRHOIDS are varicose veins at the lower end of the lower bowel. They form small tumours projecting into the bowel, and may gradually pass through the anus and appear on the exterior. The *cause* is chronic obstruction to the circulation in this region. The more important causes of this are constipation, congestion of the liver, and pregnancy. Another cause of importance is the abuse of aperient medicines, especially such as contain aloes, which many of the patent pills do. The *symptoms* to which piles give rise may be very slight. On the other hand, they may cause troublesome itching; they may bleed freely; or they may become inflamed. Inflammation of piles is popularly known as "an attack of the piles." This causes much pain and irritation, and lays the sufferer up for some days. The *treatment* should be preventive. This consists in properly treating a tendency to chronic constipation. When present, constipation and the reckless use of strong aperients is to be avoided; all straining at stool must be avoided, especially after the motion has been passed; there is risk of this, because the piles act like a foreign body and excite an effort to expel them. If piles are extruded, they must be washed and replaced by steady pressure applied with the aid of a clean rag smeared with vaseline on one side. When inflammation occurs, bed, spare diet, and a course of Epsom salts are indicated; fomentations, spread with belladonna and glycerine, should be applied locally three hourly. If piles bleed, this can be checked by astringent injections or by hazeline ointment applied well inside. It is unwise to check this without medical advice. For itching, confection of pepper is recommended by the mouth daily. If piles are large and troublesome, a surgeon can remove them.

PILLS are made of some drug which is combined with a suitable basis. The basis most often used is either syrup of glucose, soap, confection of roses, or extract of liquorice. The whole is thoroughly mixed and then divided into equal portions, each of which is rolled into a pill and coated. Pill-making is now almost entirely in the hands of the manufacturing chemist, who uses special machinery for the purpose. The Pharmacopœia contains nineteen different pills. Of the *aperient pills* the Plummer's pill containing calomel, blue pill, colocynth and hyoscyamus pill, and compound rhubarb pill, the two latter containing aloes, are most often used [Refer to *Constipation*, however]. In *diarrhœa* the lead and opium pill is often useful, whilst the compound soap pill also, be it noted, contains opium. In *anæmia* the Blaud's pill and the aloes and iron pill, both containing iron sulphate, are largely used. Out of the very large number of pills offered for sale by different makers, the above have, at any rate, stood the test of time. To *swallow a pill* do not throw the head too far back. A little water should be taken before and afterwards.

PIMPLES are most often due to *acne*, though at times due to other causes, e.g. measles or typhoid fever. [Refer to *Acne* and *Skin*.]

PINS are often swallowed owing to the foolish habit of holding them in the mouth. A bowl of gruel should be taken, and an emetic avoided. In the vast majority of cases no harm results.

PLAGUE is an infectious fever caused by a germ—the plague bacillus—which was discovered by Kitasato, a Japanese, in 1894. Infection is spread by contact of the sick with the healthy, by infected articles, e.g., clothing, and by rats. Bad sanitary conditions and insufficient food facilitate the spread of the disease. The white races are less susceptible than the black and yellow. The disease is the same as the black-death of the Middle Ages, but it has gradually disappeared from Europe since then. The symptoms are fever, headache, pain in the back, delirium; buboes or enlarged glands appear in the groins and armpits two or three days later; hæmorrhages under the skin, common in the severe epidemics, have given the name of black-death. In severe cases death may occur in a few hours. In the mildest cases, slight swelling of the glands in the groin, preceded by malaise, are the only symptoms, and such cases, occurring amongst dock labourers and the like, have often been mistaken for venereal disease, and an epidemic has thus taken origin.

PLASMON is an albuminous food extracted from milk. See *Food*.

PLASTER is a preparation that adheres when applied to the skin. Plasters are made of an active ingredient combined with a suitable basis, e.g., lead soap, oil or resin, which is spread on linen or other material. Of the twelve which the Pharmacopœia contains, diachylon or lead plaster, belladonna plaster and soap plaster are the most often used. Sticking plaster is prepared from lead, resin and soap. It is much better not to put sticking plaster directly over a cut, but to first put on some simple dressing, e.g., clean linen or boric lint, which may then be secured in position by a strip or two of sticking plaster. This is because plaster is irritating and impedes the healing process, its only value being to keep out the dirt and to draw the edges of the wound together. Moreover, if the cut should be in the least dirty, the plaster shuts it in and mischief will result. Corn plasters are prepared with salicylic acid. Blistering plasters are composed of cantharides. [Refer to *Blisters*.]

PLETHORA is a condition in which the blood-vessels are over-full. The term is from the Greek "to fill." Subjects of plethora are usually middle aged, bull necked, florid, heavy, strong, active, and free livers. They are liable to apoplexy and to kidney trouble. They should moderate their diet, avoid constipation, alcohol, and sudden muscular strains.

PLEURA is the membrane that lines the surface of the lung, and also the inner surface of the chest-wall. The layer covering the lung is in contact with that covering the chest-wall. [See *Chest*.]

PLEURISY is inflammation of the pleura. There are two forms, the dry and the moist. In the latter form fluid is poured out by the inflamed pleura, and accumulates between the chest wall and the lungs, the latter being compressed. The fluid may be either a clear serous fluid or matter. In the latter case an "empyema" is said to be present. The cause of empyema is usually pneumonia or some fever. The cause of the other forms of pleurisy is chill or tuberculosis or rheumatic fever. It must be remembered that a large proportion of cases of pleurisy are due to tuberculosis, and are often the first symptom of a consumptive tendency, which, taken in time, is generally curable (in at least two-thirds, according to Osler). The *symptoms* of pleurisy are of sudden onset; acute pain in the side with each breath, a rise of temperature, and a cough. If fluid accumulates in the chest, the inflamed surfaces of pleura are separated by it and the pain thus relieved, but the lung being compressed shortness of breath is increased. The fluid, if not matter, will be reabsorbed, usually within a fortnight, though if sufficient in amount to displace the heart it may have to be drawn off by the doctor before this. If matter forms it must be let out by a small operation as it is rarely absorbed spontaneously, and if neglected it causes blood-poisoning. The *treatment* should be rest in bed, a spoon diet, a slight purge, and the application of either heat or cold to the painful part. Heat is best applied with a bran or linseed poultice, cold is applied with an ice-bag. The former is the most usual, though many authorities advocate the latter. Mustard, turpentine, and blisters are not recommended except by medical orders. A belladonna plaster or belladonna fomentations may be applied. All sudden movement is dangerous if much fluid be present, and until medical advice is obtained it is wise to act as though such fluid was present. Cases of sudden death due to getting out of bed to pass water have been recorded by Cheadle and others.

PNEUMONIA is a disease caused by a germ—the pneumococcus—which attacks the lungs of those whose resist-

ance is lowered by a chill, alcohol, typhoid fever, or other cause. An acute inflammation of the lungs is set up, having for its purpose the imprisonment of the germ in the lung in order to prevent infection being carried in the blood to other parts of the body. In certain cases such infection does occur, and inflammation of the pleura, membranes of the brain, joints, etc., then follows. In many of the lower animals, the lungs invariably fail to stop the entrance of the germs, with the result that a fatal blood-poisoning occurs instead of the inflammation of the lungs, that we are familiar with in man. The *symptoms* begin abruptly with an attack of shivering followed by a rapid rise of temperature, and a troublesome dry cough. The face is flushed, the breathing hurried. The pulse, though quickened, is not so much increased in rate as the breathing. The patient remains in this condition for five, seven, or nine days, when the fever terminates by a sudden fall or crisis, accompanied by sweating; the difficult breathing is relieved shortly afterwards. The chief danger is death from exhaustion on the day preceding what would normally be the crisis. In the later part of the attack expectoration of a typical rusty colour occurs. Lack of sleep is common, and delirium is of frequent occurrence. The *treatment* is to put the patient to bed; give a spoon diet at regular intervals of two hours; allow the thirst to be quenched between whiles by water or lemonade; have the room well ventilated; apply neither poultice nor ice-bag to the chest unless pain be severe, as any extra weight of this kind hampers the breathing, which is already much embarrassed, and also because no attempt to "draw out the inflammation" by such means will succeed. As the pulse shows signs of failing (by its rapidity or irregularity) brandy will be required in half-ounce doses given every one, two, or three hours, as the case demands. Besides alcohol, drugs that stimulate the heart are also used. The case should, of course, be in medical hands, if possible, from the outset. The chance of recovery is very good in those under thirty, and becomes progressively less as age advances. The risk of relapse, once the crisis is over, is practically absent. Pneumonia does not protect, like most fevers do, against a subsequent attack. [Refer to *Sick Room*.]

PODAGRA is a name for gout.

POISONS are divisible into two main groups:—(1) those in which an emetic is on no account to be given; (2) those in which an emetic should be given as soon as possible. Group (1) includes the *corrosive poisons*, which from their caustic action eat into the stomach wall and may perforate it. The corrosive poisons are the strong mineral acids, and the caustic alkalies, e.g., caustic soda, ammonia, and quick-lime. Although so different in most of their chemical reactions, mineral acids and alkalies, unless freely diluted, produce the same corrosive effect on living tissue. If vomiting is induced in such cases, the stomach is apt to burst at one or more of the weak spots that the poison has produced. Such an accident is almost invariably fatal. In all other cases of poisoning, in which the poison has been swallowed, an emetic should be given, unless the patient is unconscious.

HOW TO ACT IN A CASE OF POISONING.

(1) Send at once for a doctor. (2) Preserve any poison bottle, medicine, food or vomit just as it is till the doctor arrives, otherwise the most essential evidence will be destroyed. Look quickly for a label on any poison bottle found, and note the odour of the contents; prussic acid, carbolic, a fuming mineral acid, ammonia, etc., may often be thus recognised. (3) If the nature of the poison is known, it is possible to apply treatment specially adapted to it, as shown in the table below. (4) If there is no clue to the nature of the poison, follow these directions:—

(*a*) Note if the lips or clothing are burnt. If they are, the poison is a corrosive one, and an emetic must not be given.

(*b*) If the patient is unconscious, an emetic must not be given. The patient should be aroused either by speaking to him, shaking him, or flicking him with a wet towel, but not by holding smelling salts to his nose, as these may do harm to the air passages before the patient is aroused by them. If he is unconscious and the breathing is weak, artificial respiration, as described under ***First Aid***, should be resorted to at once.

(*c*) Unless a corrosive poison has been taken, or the patient is unconscious, an emetic should be administered promptly, even though the exact nature of the poison is unknown. The best emetic is a tablespoonful of mustard in a tumbler of tepid water, though copious draughts of tepid water or salt and water may be used if necessary. The action of the emetic should be aided by the introduction of the fingers or a feather well down into the throat.

(*d*) In all cases of poisoning, if the patient can swallow, it is good treatment to give milk, or beaten up eggs, or strong tea or coffee, or salad oil. This may be done both before and after an emetic has acted. These remedies act as antidotes to many common poisons, and some of them also salve the irritated lining of the stomach.

(*e*) Lastly, treat the shock, which many poisons cause, with warmth and stimulants, and do not let the patient go to sleep until the doctor has arrived.

For convenience of reference, these rules are best expressed in tabular form:—

CORROSIVE POISONS.

Never give an emetic.

POISON.	TREATMENT.
Vitriol or Sulphuric Acid. Aqua Fortis or Nitric Acid. Spirits of Salt or Hydrochloric Acid. Burnett's Fluid.	Magnesia, Washing Soda, Chalk, or Whiting to be given in milk, in small quantities, frequently repeated. Afterwards salad oil and a little ice.
Carbolic Acid.	Lime water; then milk or salad oil; later on Glauber or Carlsbad salts.
Salts of Sorrel or Oxalic Acid. (This is the only crystalline powder that is a corrosive poison).	Chalk or Whiting in milk or water. (The plaster behind the wall-paper will do, if crushed and given in water). Afterwards give brandy and warmth. Prompt action is essential.
Ammonia or Spirits of Hartshorn. Caustic Soda or Potash. Quick-lime. Soap Lees.	Lemonade or vinegar in large doses in plenty of water. Afterwards ice to suck and salad oil.

NON-CORROSIVE POISONS.

(This group includes any not mentioned above).

Always give an emetic, unless the patient is unconscious.

If breathing is failing, resort to artificial respiration. After the emetic administer the antidotes given below.

POISON.	ANTIDOTE.
Aconite.	Brandy; Warmth; Castor Oil.
Alcohol.	Hot coffee; Epsom salts.
Antimony contained in tartar emetic and James' powder.	Tea or coffee or red wine.
Belladonna, Deadly Nightshade berries, Eye lotions that dilate the pupil, Liniments of a treacle-like appearance.	Brandy; Hot coffee; Lemons to suck. (Delirium may occur).
Conium or Hemlock.	Brandy, castor oil. Keep patient awake.
METALLIC POISONS, e.g., arsenic, copper, lead, mercury, zinc, etc., and their compounds, red or white precipitate, corrosive sublimate, emerald green, blue vitriol, Scheele's green, chrome yellow, Simpson's rat paste, etc.	Egg and Milk; Brandy. Warmth to the abdomen.
Silver Salts.	Salt and Water, followed by warmth to the abdomen.

POISON.	ANTIDOTE.
NICOTINE. (In children due at times to using an old pipe to blow soap bubbles with.)	Stimulants.
OPIUM or MORPHIA.—This is contained in:—Battley's Solution, Black Drop, Children's Quietness, Chlorodyne, Dalby's Carminative, Dover's Powder, Godfrey's Cordial, Laudanum, Nepenthe, Paregoric, Powell's Balsam of Aniseed, Syrup of Poppies, Winslow's Soothing Syrup.	Half-a-pint of water made bright red with Condy's Fluid *or* Permanganate of Potash; Hot Coffee. Keep patient awake, and to do this successfully it may be necessary to squirt cold water in the face, or to flick with a wet towel, etc.
PHOSPHORUS: contained in most rat pastes.	Condy's Fluid in water, sufficient to make a bright pink mixture; *or* Sanitas, a tablespoonful in water; then, Egg and Milk.
Prussic Acid and Cyanide of Potassium.	Apply Smelling Salts; Artificial Respiration.
STRYCHNINE; contained in Nux Vomica, Easton's Syrup, and many Vermin killers, e.g., Battle's, Butler's and Gibson's.	Keep patient very quiet in a darkened room. Any sudden noise or light may induce a painful cramp.
Toadstools and other fungi.	Brandy; Warmth; Castor oil.

POISONOUS PLANTS. The number of poisonous plants growing in Great Britain is small. At the same time it is wise to guard children from eating any fungus and any wayside berry except the blackberry, raspberry, and bilberry. The berries of the yew, bryony and cuckoo-pint or arum, and the seeds of the laburnum are poisonous, so also are the berries of the deadly, and the woody, nightshade. The treatment in these cases should be that for Belladonna [see *Poisons*]. The common nightshade of the hedge row is not the deadly nightshade, as is usually thought, but the woody nightshade, *Solanum dulcamara*, the berries of which, though poisonous, are far less deadly. As the name "dulcamara" indicates, the taste of the berry is a sweet-bitter, and this is sufficiently nauseous to children to prevent a poisonous quantity of the berries being taken. The deadly nightshade, *Atropa belladonna*, on the other hand, has luscious sweet black berries as large as cherries, which children eat greedily. Fortunately the deadly nightshade is a rare plant. The treatment required, if any of the above berries have been eaten, is that given under *Belladonna* in the article on *Poisons*. The hemlock tribe includes a great number of harmless plants, e.g., wild carrot, fool's parsley, etc., the leaves of which are at times eaten by children in mistake for true parsley. Parents are often much alarmed as they fear hemlock, *Conium maculatum*, which is highly poisonous, has been eaten. The distinguishing features of this comparatively rare plant are given below. For treatment see *Conium* in the article on *Poisons*. The root of monkshood, *Aconitum napellus*, is at times eaten by mistake for horse-radish. Both plants are commonly grown in cottage gardens. As the monkshood contains a deadly poison, the distinguishing points given below are worthy of attention. Monkshood is a pretty blue flower not unlike larkspur; it is known also as wolfsbane and blue rocket. For treatment see *Aconite* in the article on *Poisons*. The sap of a few other plants is poisonous, e.g., that of henbane, the leaves and flowers of the potato, the thorn apple, foxglove, meadow rue and savin. These plants, however, present no part likely to be eaten by mistake. A hot-house plant, the *Primula obconica*, produces a rash on the hands and face of those who handle it. The fungi that somewhat resemble mushrooms are the plants that most commonly cause serious mistakes. The distinguishing features are given below. The treatment should be an emetic, followed by warmth and stimulants.

	Deadly Nightshade.	Woody Nightshade.
Berries	Large; arranged singly; taste-sweet.	Small; arranged in clusters; taste sweet at first then bitter.
Flowers	Arranged singly; bell-shaped; purple at the border.	Arranged in clusters; star-shaped; violet with yellow centre.

	Hemlock.	Harmless Plants allied to Hemlock.
Stem	Smooth and spotted with red, on the larger stems.	Rough and not spotted.
Flower-head	Without bracts (bracts are little leaves like a calyx) at the base of the flower-head.	With bracts.

	Monkshood.	Horse-radish.
Root	Short, tapers to a point; with many little roots branching from it.	Long, tapers but little and ends abruptly; with few little roots branching from it.
When scraped	Soon turns pink.	Remains white.
Taste	Pungent at first, then numbing.	Pungent only.

	Poisonous Fungi.	Mushroom.
Odour	Often unpleasant.	Pleasant.
Taste	Often acrid.	Pleasant.
Surface	Often moist and rarely peels easily.	Always dry and the upper surface peels readily.
Colour	Often bright or intense white.	Whitish above, deep brown below in the larger specimens, and a lighter brown in the smaller ones.
Where growing	Usually in damp places, on or under trees.	On dry open pastures.

N.B.—Nine-tenths of the cases of fungus poisoning are due to the Death Cup, *Agaricus phalloides*. This fungus grows in woods; it is of a pale yellow colour on the upper side and white on the under side; its stem presents a loose white collar near the top, and a loose cup-like sheath at the base.

POLYPUS is a growth, shaped like a cherry, springing from a mucous membrane. It is most common in the interior of the nose. The diagnosis and treatment require a doctor.

POMATUM is not recommended. When used, some material which does not turn rancid is required, e.g., vaseline or castor oil scented. [Refer to *Hair*.]

PORK See *Food*.

PORT WINE, though largely used at the present day for invalid purposes, is not recommended, unless selected with special care, as so much that is on the market is port only in name. Cognac brandy is the best alcoholic stimulant for the sick room. As a tonic the use of wine, except under medical supervision, is very unwise and as a rule quite uncalled for.

POST MORTEM examinations can be made without leaving any traces. They are invaluable to medicine as a whole, and also to each individual doctor who makes them. Permission to perform one should always be granted. There is nothing which makes the opinion of the consultant worth more than that of the general practitioner so much as the fact that he has frequent opportunity in his hospital work of verifying his diagnosis *post mortem*, whereas the family doctor rarely has. It is not a question merely of seeing if the patient died of such and such a disease, say consump-

tion, of that there is often no doubt whatever, the question is, does the mental picture of the state of the lungs formed during life correspond with that actually found at the post-mortem? It is by a series of such lessons over many years that the really accurate physician is made. Again, in public institutions, e.g., asylums and workhouse infirmaries, where the number of patients is very large in proportion to the number of doctors, there is nothing which keeps each member of the staff up to the mark so much as the fact that his diagnosis is liable to be verified or the reverse, in the presence of his colleagues in the post-mortem room. In the silent reproach of that cold corpse when a condition comes to light which a prompt resort to surgery might have relieved, there is a force that no human criticism can ever hope to attain. The Board of an Institution by doing all it can to encourage a post-mortem being performed on every case of death, especially if apparently of no interest, will do more to promote efficiency than by almost any other measure. Such post-mortems are, of course, private. We mention this because we find relatives confuse a post-mortem with an inquest, and they often decline permission at first solely on this account.

POTASH is used in many forms. Caustic potash, in the form of solid sticks, is used as a caustic. Citrate of potash, dose, twenty to sixty grains, is largely used in gout to clear the blood of the uric acid salts with which it is laden; bicarbonate of potash is used to form an effervescing draught when mixed with citric acid; twenty grains of the former, dissolved in water, neutralises fourteen grains of the latter dissolved in water, forming citrate of potash, and ... ing free carbonic acid gas, which escapes, producing effervescence. Potash water is very like soda water, and is composed of water containing a small amount of potash and a large amount of carbonic acid in solution. Bitartrate of potash, or cream of tartar, in doses of twenty to sixty grains in water, is a cooling summer drink, but in doses of a quarter to one ounce it is an aperient, which acts soon after it is taken.

POULTICE is an application which is both soft and moist. It is at the present day nearly always used hot, though an ice poultice is occasionally used for applying cold. An ice-bag is, however, much more convenient. Poultices are not nowadays applied to wounds or boils, fomentations being used instead, as they are antiseptic. But to apply heat to the unbroken skin the poultice is the better, as it retains its heat longer than the fomentation does. The linseed poultice is the one we recommend, as the bread poultice soon turns sour.

TO MAKE A LINSEED POULTICE.—Get ready two basins, two metal plates or old soup plates, a large wooden spoon, a clean cloth, some linseed, preferably the crushed variety, olive or salad oil, and a kettle of boiling water. Put the two metal plates in the oven. Heat the bowl by standing boiling water in it, and warm the spoon and linseed by the fire. When all is warmed put fresh boiling water in the bowl, using less than the beginner is inclined to, and stir the linseed in a little at a time until the mixture is sufficiently stiff to enable the spoon to stand upright when thrust into it. Now spread an even layer on the cloth; smear the surface with olive oil, then place the poultice between the two hot plates and carry it to the bedside.

The linseed poultice is useful for a whitlow before it comes to a head, and for pleurisy, pneumonia, stomach-ache and many conditions of deep-seated inflammation, though in pneumonia it is becoming obsolete. Poultices are also used as counter-irritants in bronchitis, lumbago, etc. For this purpose the mustard poultice or the mustard leaf is the best.

TO MAKE A MUSTARD POULTICE.—Make the same preparations requisite for preparing a linseed poultice, with the mustard in addition. The poultice is then prepared in the same way, except that equal parts of mustard and linseed are used. When required for children one part of mustard to three of linseed meal should be used.

The mustard poultice should only be left on the skin for a sufficient length of time to produce redness. As a rule, this is only so long as the patient can bear it, but with those accustomed to its application and with school-boys it is often borne long enough to produce blisters or even serious damage to the skin. Hence its effects should be watched. The mustard leaf dipped in hot water and applied is more convenient and quite as efficacious as the mustard poultice. Of the many other poultices formerly in vogue, we recommend none; especially worthy of condemnation is the charcoal poultice, formerly supposed to have a healing effect on poisoned wounds.

POWDERS are useful for children before they are old enough to take a pill. The most useful is *grey powder*, a mixture of mercury and chalk, the dose of which is a half to one grain for a child. For indigestion, wind, or disturbed bowels, it is of great value in the treatment of infants, and is recommended in preference to the "teething powders" that are sold, many of which contain opium and other unsuitable ingredients. *Gregory's powder* is a nauseous preparation of rhubarb which should never be given now that so many less disagreeable aperients are obtainable. A mixture of grey powder one grain, with carbonate of soda two grains, and powdered ginger three grains, makes a good stomachic mixture for occasional use for an infant. For adults liquorice powder, compound jalap powder, and seidlitz powders are familiar aperients; Dover's powder in ten grain doses contains one grain of opium and is useful at the onset of a cold. Antimony powders, a substitute for the James' powder, once much in vogue, is now seldom employed.

PREGNANCY, MANAGEMENT OF. The ordinary daily duties should be carried on as usual. Some exercise in the open air should be taken daily, as good muscular tone greatly aids childbirth. All strains and jolting should be avoided, as they promote miscarriage. The skin should be kept active by a daily bath and the bowels regulated by mild aperients. Internal douches are, as a rule, unwise. The mind should be kept pleasantly occupied, and all anxiety and fright avoided as much as possible. The dress should be such as to avoid pressure, garters and tight stays being unsuitable, though an abdominal belt may be useful if the abdomen is lax and prominent. The nipples must be guarded from pressure, and should be hardened towards the end of pregnancy by bathing in weak spirit. Maternal impressions have no effect on the infant, the sight of a negro or a cripple, for instance, need cause no alarm.

(1) Vomiting requires rest in bed daily until the usual time for its occurrence is passed; care in the diet and attention to the bowels.

(2) Severe itching requires the application of a solution of borax, three drachms to the pint, or lead lotion, and cold cream should be applied afterwards.

(3) Swelling of the feet and of varicose veins should be met by resting with the feet up as much as possible.

(4) Swelling of the face should be reported promptly to the family doctor.

(5) Cramps in the calves are best relieved by friction with the hands.

(6) Piles may be troublesome, and should be treated as directed under that heading.

(7) Melancholia is not rare during the earlier part of the pregnancy. It will cease as the pregnancy advances.

(8) Threatened abortion, stoppage of the water, or convulsions require prompt medical aid.

PRESBYOPIA, the long sight of advanced life. [See *Sight.*]

PRICKLY HEAT. A condition of the skin caused by the formation of sweat faster than it can escape from the pores. It is best treated by creolin, one teaspoonful dissolved in a pint of water, the lotion, thus formed, to be dabbed on frequently. Lead lotion, or a lotion made of one part of pure carbolic acid, dissolved in eighty parts of water, may also be used. Light clothing, a daily bath and a free action of the bowels should also be secured.

PROLAPSE is the descent of an internal part so that it appears externally. The two organs liable to this malposition are the uterus and the lower bowel. The latter is most often affected in this way in childhood. The cause is prolonged straining at stool from constipation, or other source of bowel irritation, or from straining to pass water due to a need for circumcision or from stone in the bladder. Hence a careful medical examination is indicated to detect and remove the cause. The prolapsed bowel should be at once washed and then gently squeezed back by grasping

it with an oiled rag. This is best attempted with the patient lying on the side and with the buttocks raised. After the replacement of the bowel has been accomplished, a diaper should be folded and passed between the legs; this should then be secured in front and behind to a waist belt. In future the child should pass its motions lying down, all strong aperients must be avoided, and any prolapse corrected directly after the motion.

PROPHYLACTICS, literally "guarding beforehand," are measures taken to prevent illness. Thus a dentist by stopping carious teeth prevents toothache; a youth with consumption in his family may guard himself from being a victim by an open air life and temperate habits; the spread of epidemics may be checked by disinfection and the prompt isolation of patients suffering from the complaint, and so on.

PROSTATE is a gland which surrounds the neck of the bladder in males just at the spot that the bladder opens into the urethra. In later middle age it often enlarges, and then may cause difficulty in passing water, and from time to time attacks of acute congestion, commonly known as "an attack of the prostate," may occur. In such an attack there is retention of the urine, with local discomfort and often slight fever. Such cases require prompt medical aid. These attacks may be guarded against by avoiding chill and alcohol, especially the more acid wines. It is often while waiting for a hansom on a cold night, in evening dress, that the chill to the bladder and prostate is caught.

PROUD FLESH is the popular name for the feebly growing new tissue that forms on the surface of a wound that is not healing properly. It should be touched with lunar caustic. [Refer to *Wounds.*]

PRUSSIC ACID. See *Poisons.*

PSORIASIS is a common skin disease, apt to recur in the spring and autumn for years. It is recognised by the patches of silvery scales present usually on the elbows and knees and the backs of the forearms. The scales are dry; there is nothing greasy about them. If removed, the skin beneath is seen to be red. Some scaliness is often present on the head also. Itching is often troublesome. Solution of coal-tar half a drachm, white precipitate ten grains, oil of cade a drachm, worked up with an ounce of vaseline is an efficient remedy if applied night and morning. Hot baths with soft soap and pumice stone should be used frequently till the scales are off. If the skin becomes inflamed, zinc or calamine ointment should be applied for a few days and the above ointment then resumed. Medicines do little good. If the head is scaly it should be treated as for baldness [which see].

PUBERTY is the transition stage from childhood to manhood or womanhood. Associated with the development of the sexual organs and instincts are certain physical changes, such as the breaking of the voice, the appearance of hair on the face in the boy, and the development of the breasts and the establishment of menstruation in the girl. At no time in later life has the body to undergo such marked changes. The strain on the constitution is considerable. It is a time of life which, in the delicate especially, requires care, plenty of fresh air and good food, and absence of worry. The mind is often unstable and is more emotional than before. Unfortunately it is a time of life in which school examinations frequently occur, and when the entrance examination for the future professional career has often to be prepared for. It is not surprising, therefore, that nervous breakdown is common at this time, especially in those with inherited tendency to it. Such cases require special care. All, at this time, are the better for a few words of advice from their guardians.

PUBLIC HEALTH, or Preventive Medicine, is concerned with the prevention of disease, wherever possible. Wise laws, honestly carried out, can do far more in this matter than is popularly supposed. This involves, however, interference with the liberty of the subject, and an increase of the local rates; and hence the present administration of the laws relating to public health admits of much improvement. In the interest of public health the State is bound to take under its jurisdiction:—Rivers, to prevent their pollution by factory refuse or sewage; buildings, their site and construction, sewage and scavenging; water supply; food, its purity and the sanitary condition of the buildings in which the food is prepared, e.g., dairies, bake-houses, and slaughter-houses, factories and workshops, especially in relation to light and ventilation; the regulation of the liquor traffic; the disposal of the dead; the control of infectious disease by vaccination, isolation hospitals, disinfection and compulsory notification.

These matters, since 1875, when the Public Health Act was first passed, have been under the control of one central authority, the Local Government Board. Acting under this central authority are Boards for each district, the Local Sanitary Authorities, who are aided by permanent officials, the Medical Officers of Health and their assistants. The matters of pressing public importance at present include the housing problem, river pollution, the smoke nuisance, the disposal of the dead before burial where several people occupy the same room, the prevention of consumption, and the more efficient supervision of the preparation and storage of food, especially sausage and ice cream making, and lastly the greatest problem perhaps of all, the *drink question.* The reduction in the number of licensed houses, and the establishment of thoroughly well-ventilated and cleanly buildings, in which the sale of food and of temperance drinks is encouraged, whilst the alcoholic liquor sold is pure and good of its kind, would in the opinion of many constitute a most valuable reform. But the whole question is too complex to be dealt with here. It is worthy of remark, however, that the boarded floor covered in sawdust, so commonly to be found in the public house of the day, is a potent means of spreading consumption, as the sawdust encourages promiscuous expectoration, and a large proportion of bar-loafers are consumptive. [Refer to *Air, Dead, Disposal of, Drains, Fevers, House Sewage, Ventilation, Water.*]

PUERPERAL FEVER is the entirely preventable fever due to bad hygiene, or lack of antiseptic precautions, in the management of child-birth. The most deadly form usually sets in within three days of child-birth, and begins with an attack of shivering, drying up of the milk, high fever, and often delirium. A less severe form more commonly begins about the tenth day. The treatment must be in medical hands. [Refer to *Child-birth.*]

PUERPERAL INSANITY is a form of insanity, usually temporary, that occurs at times after child-birth. The onset is often sudden, the patient becomes wild and restless, and may do injury to herself or her child unless she is carefully watched.

PULSE is a throbbing in a blood-vessel, limited as a rule to the arteries and caused by the injection of some four ounces of blood at each heart-beat into a system of blood-vessels already distended with blood. This sudden addition to the contents of an arterial system, already full, gives rise to a pressure wave, which passes rapidly from the main artery at the outlet from the heart to the arteries in all parts of the body. The rate at which the wave travels is about 30 ft. per second. Hence with one hand on the heart and the other feeling the pulse at the wrist, the heart-beat and the pulse appear to be simultaneous. That this is not so we know by accurate measurement with apparatus devised for the purpose, which shows the minute interval of time really present between them. It is a popular error to think the pulse is only to be felt at the wrist. It may be felt in any superficial artery, e.g., at the temple, in the neck, front of the thigh or behind the ankle on the inner side. The wrist is the most convenient. The spot to feel is just above the ball of the thumb, on the outer side of a tendon that is readily felt there. The pulse-rate in the new-born is 130 to 140 per minute, in childhood about 100, in the adult 70 to 75, in old age 80. The rate is slightly higher in the female than the male. In health it is increased by exertion; there should be five beats difference per minute between lying and sitting, and five more between sitting and standing, whilst a short run upstairs raises it to 120. After an acute illness, the pulse becomes rapid in response to any exertion, that in health has but

little effect. Hence it is unwise to be in too much hurry to sit up during convalescence, a difference only of ten beats per minute in the pulse rate means about 10,000 beats per week, and the rest to the heart given by another week in bed is thus apparent. In illhealth the pulse rate is increased with few exceptions. In fever it rises ten beats for each degree the temperature is above normal, except in scarlet fever, in which the rise of pulse-rate is still greater. In exhaustion and after severe loss of blood the pulse-rate is increased even though the temperature has fallen to below normal. Nervousness and many emotional states raise the pulse-rate remarkably, and may give rise to an erroneous belief that something is wrong. Except during the convalescence from fevers the pulse-rate is seldom diminished, though in some people it is always low, thus Napoleon had a pulse-rate of forty. More important than the rate is the regularity of the pulse. An irregular pulse may indicate serious heart mischief, but may be merely due to dyspepsia or excessive consumption of tobacco. It should be borne in mind that the pulse is often irregular in early life, especially during sleep, without anything being amiss. Another point from which the doctor gains much information is the "feel" of the pulse. From this he learns whether the pressure within the blood-vessels is high or low, whether they are full or empty between the beats, and whether the wall of the artery is normal or not. From these facts inferences can be drawn concerning the state of the circulation, the kidneys and other important organs. It is thus clear that the prominent place given to the pulse in a medical examination is justified by its importance. It is also, we trust, equally clear that amateur attempts to examine a pulse and draw inferences from it are sure to be futile. To count a pulse accurately is soon learnt, but to *feel* it requires an expert.

PURGATIVES. See *Constipation.*

PURPURA, known also as the "Purples," is the name of a rash caused by the rupture of small blood-vessels and the escape of blood beneath the skin. Purple patches are thus caused which do not disappear on the application of pressure, and which vary in size from that of a flea-bite to that of a half-crown or more. The cause is either (1) some change in the blood, which makes the walls of the smaller vessels no longer capable of withstanding the pressure within them, or (2) rupture of vessels from strain, e.g., whooping cough or from absorption of the fat which normally supports them, as in the hands of old people, or (3) is due to strong nervous disturbance, as in the stigmata of the martyrs, some cases of hysteria, neuralgia, etc. Group (1) includes many grave conditions, e.g., the worst forms of the infectious fevers. Group (2) is not serious. In all cases, however, send for the doctor.

PUS is "matter." See *Inflammation.*

PUSTULE is a pimple that has come to a head. A saturated solution of boric acid may be used as a lotion applied frequently. Malignant Pustule is the first symptom of a malignant fever termed "Anthrax" or Woolsorter's Disease (which see).

PUTREFACTION. See *Bacteria, Dead, Fermentation.*

PYÆMIA, literally pus in the blood. See *Blood-poisoning.*

PYREXIA is a condition in which the temperature is above normal. [See *Fevers.*]

PYROSIS, literally to burn, is the technical name for Water Brash (which see).

QUACK is one who lays claim to powers or knowledge that he does not possess. The tendency to believe what one is told is sufficient to enable quacks to make a thriving living. Many claim to be qualified doctors, who have been struck off the rolls, because they have refused to divulge the nature of some "wonderful remedy" that they have discovered. Others claim to have been born with a healing power, which required no medical training to develop. Quacks are not absent from the ranks of the medical profession. The surgeon who operates without cause, and the doctor who gives an opinion which is not based on careful examination of the patient and his history, are really, if not legally, quacks.

QUARANTINE is the time during which those exposed to infection on a given date must wait without further exposure to infection, before it is known whether they have taken the disease or not. The time varies with each infectious disease [Refer to *Fevers.*]

QUARTAN FEVER is one form of ague.

QUININE, the active principle of Peruvian Bark or Cinchona, is invaluable in the treatment of malaria or ague, as it possesses the power of destroying the parasite of malaria, which lives in the blood. Large doses are used for this purpose, e.g., 5 to 20 grains four times a day. People in malarious districts often do harm by overdosing themselves. Given during the height of the attack it often increases the headache and does harm. In smaller doses, e.g., 1 to 2 grains, quinine is largely used as a tonic. It is often combined with perchloride of iron, as the acid perchloride dissolves the quinine. Quinine may also be taken in pills or tablets so as to avoid its bitter taste. It should not be taken if the stomach is out of order, or if there is a tendency to deafness. Repeated doses are prone to upset the digestion, to cause ringing in the ears, and to produce a dull headache. It is used in the treatment of neuralgia, blood-poisoning, rheumatism, and to reduce high temperature. Owing to its intense bitterness, children do not take it well. [Refer to *Drugs.*]

QUINSY, strictly speaking is an abscess in one tonsil, but other forms of sore-throat are often included in the term when used popularly. [Refer to *Sore-throat.*]

RABIES, literally madness, is the disease in dogs which, when transmitted to man by the bite of a mad dog, causes hydrophobia. The disease has been stamped out in England by the Muzzling Act. [See *Hydrophobia.*]

RAILWAY SPINE is a condition that often follows a railway accident. Some time after the accident, symptoms of spinal complaint develop, e.g., weakness or stiffness of the legs, tenderness over the spine, etc. Some of these cases are due to concussion, others to hysteria. The prospect of recovery varies greatly in different cases.

RASH is a breaking out on the skin, usually comparatively sudden in origin. Nettle rash and the rashes of the infectious fevers are examples. Each fever has a rash characteristic of itself, though in certain cases they simulate one another closely, thus German measles rash may be almost indistinguishable from that of scarlet fever. [Refer to *Fevers* and to the separate article on each.]

RAW MEAT JUICE is the best form of concentrated meat food. It should be prepared fresh every twelve hours, according to the following recipe:—

> Remove all skin and fat from raw shin of beef; mince the lean and place it in a bowl. Add a pinch of salt and just enough water to cover it. Allow to stand for some hours in a cool place, preferably on ice. Then strain through muslin and forcibly squeeze the residue in a lemon squeezer until the last drop of juice has been expelled. The object aimed at is to rupture the fibres of the meat and obtain the juice that they contain within them. The first straining, together with the juice obtained from the lemon squeezer, together constitute raw meat juice.

It is far more nourishing than beef tea, and most easily digested, provided it is not heated. An infant can take a quarter of a pint in the course of the day. The juice is not very appetising, however, and children, curiously enough, often take it much better if a dash of port wine is added, though to the adult palate this addition is not an improvement. It may also be disguised by giving a little malt extract with it. In order to dissolve the cement which binds the meat fibres together, the addition of a few drops of hydrochloric acid or spirits of salt is often made to the salt and water with which the mince-meat is covered. Raw-meat-juice is used in practically all hospitals for giving nourishment in cases of severe prostration, from whatever cause, and it is also valuable in the treatment of rickets. Although a little more troublesome, we strongly recommend it in preference to the tinned meat-juices, excellent though some of these are. The home-made article is fresh, the tinned can never be.

RAYNAUD'S DISEASE is a disorder affecting the circulation in the fingers and toes, which in popular

language "go dead," or become white and numbed owing to the temporary lack of circulation in them. The white stage is at times followed by a blue stage, in which the finger is swollen with stagnant blood. The disease is not dangerous, nor need heart disease, paralysis, or other grave condition be feared, as Raynaud's disease is not a sign of any of these. During an attack, warmth and friction should be applied. Between the attacks, loose warm gloves and socks should be worn, and contact with cold objects, as far as possible, avoided, whilst the general health should receive attention.

RECTUM is the last eight inches of the intestinal canal. Diseases of the rectum include (1) absence of any opening from birth, (2) fistula, (3) cancer, (4) piles, (5) prolapse, (6) stricture. [Refer to these headings.]

RED-GUM RASH, technically known as papular urticaria, is a common skin disease of childhood. The rash is a form of nettle-rash, and consists in red itching spots scattered over the body, which come and go often for years. The disease appears during the first few months of life, and is often wrongly attributed to vaccination, owing to this being performed at a time of life at which the disease usually begins. It has also been attributed to irritation of the gums from the onset of teething. The *treatment* should be attention to all sources of irritation, both within and without; errors of diet, indigestion, constipation, worms, and lack of cleanliness, rough or dyed flannel next the skin, a flea or a badly placed pin, are all prone to determine an outbreak of the rash in those born with sensitive skins. The attacks are apt to recur again and again; each time, often enough, a new doctor is consulted, but the nature of the complaint is such that nothing is to be gained thereby. Soothing lotions such as lead lotion should be dabbed on, and weak creolin baths may be tried, in which only sufficient creolin is added to make the bath water slightly milky. Scratching should be checked as much as possible, as it aggravates the complaint. At night a sock may be slipped over each hand and secured round the wrist to prevent scratching during sleep.

RED LOTION is a useful application to chapped hands. It consists of sulphate of zinc two grains, tincture of lavender ten drops, and water one ounce.

REFLEX ACTION is movement produced in response to a stimulus, without the aid of the will. By a stimulus is meant anything capable of stirring a sensory nerve to action, e.g., a prick, pinch or burn, or a dash of cold water on the skin, or a sudden noise, or flash of light, or snuff in the nostril. The impression thus made in the nerve endings is conveyed by the nerve to the spinal cord, or certain parts of the brain, whence a nerve impulse is sent or reflected to the muscles, and "reflex movement" is the result. A sneeze, a cough, or the involuntary passage of water are familiar examples. The power of restraining a reflex act is usually present to some degree, a sneeze, for instance, or a cry of pain. This power is less in childhood, in sleep, in fatigue, in old age, in exhausting illnesses, and especially in many nervous disorders. The comparatively slight control of the will over the bladder in childhood should be borne in mind. Disease of one organ will often disturb another by *reflex irritation*. Thus pain may disturb the heart sufficiently to cause fainting; teething may cause convulsions, pregnancy vomiting, etc.

REFRIGERANTS are remedies for reducing fever. Cold water applied both externally and internally, and acid drinks, are examples. [Refer to *Baths, Cookery, Fever.*]

RELAXED THROAT. The treatment is the same as for elongated uvula, which is described under *Sore Throat.*

REMITTENT FEVER is one name for *ague.*

RENAL DISEASE. See *Kidney.*

RENNET is the active ingredient of the digestive juice concerned in curdling milk. Rennet is extracted from the stomach wall of the pig or calf, and used for making curds and whey. Portions of the stomach itself can be preserved and are used, but a glycerine extract is preferable. Schacht's rennet is a reliable brand. [Refer to *Milk.*]

RESPIRATION is the act of breathing. By its means oxygen is taken in and is subsequently given out again in the form of carbon dioxide, a gas formerly termed carbonic acid. This exchange of gases or breathing is going on wherever living tissue is to be found, both in animal and plant life, with the possible exception of certain bacteria. In some animals (e.g., insects), the air passages ramify all over the body, thus carrying air to every part. But in the higher animals the air passages do not extend beyond the lungs. Exchange of gases in these cases occurs between the air and the blood in the lungs. The blood then carries the oxygen to all parts of the body, and serves out oxygen to any tissue requiring it, receiving carbon dioxide in exchange. Hence breathing, in the popular mind, has come to mean the movements of the chest by which air is sucked in and forced out of the lungs. These movements are effected by a nerve centre in the base of the brain just at its junction with the spinal cord, and though they can be altered at will, they are in the main carried out unconsciously. Respiration must be thorough if health is to be maintained. Everything should be done to aid it; tight clothing, faulty attitudes, e.g., stooping over a desk or a bicycle, a mumbling voice, enlarged tonsils and nasal obstruction should all receive prompt attention. Healthy sports compel deep breathing; singing, drill and gymnastics encourage it. Special breathing exercises may also be practised daily. Habitual breathing through the mouth should never be allowed; when this is present in children, obstruction in the nose and throat is usually present, and the family doctor should be consulted. In cases of suspended respiration, *artificial respiration* must be resorted to at once. This is described under *First Aid.* [Refer to *Ventilation.*]

RESPIRATORS are now obsolete.

RETENTION OF URINE. See *Bladder.*

RHEUMATIC GOUT. See *Rheumatoid Arthritis.*

RHEUMATISM presents two chief forms, the acute and the chronic. ACUTE RHEUMATISM, or rheumatic fever, most often attacks young adults and children over ten years. The *cause* is probably a germ—the diplococcus of rheumatic fever—but this is not accepted by all authorities. Cold, damp and inherited tendency are factors in the production of the disease. The disease is not infectious. The *symptoms* are fever, profuse sweats, sore throat, inflammation of several joints, and in those under twenty years of age the heart is very commonly attacked. Indeed rheumatic fever is the principal cause of heart disease in the young. St. Vitus's Dance is common in rheumatic subjects, and is regarded as a symptom of rheumatism by most of the authorities of the day. The *treatment* is above all to secure rest, in fact, quite contrary to popular ideas, to regard rheumatic fever as first and foremost an inflammation of the heart, and to spare no effort to rest the heart until all inflammation has completely subsided. The pain is relieved by the use of salicylate of soda (20 grain doses every three hours) or of aspirin (dose rather less), and by anodynes and warmth applied to the affected joints. The treatment has to be continued for some time after symptoms have subsided, or relapses, which are very common, will occur. The diet should be at first a spoon one, and later on fish and farinaceous food. The clothing should be flannel, and the sheets are best removed from the bed, as the profuse sweating is apt otherwise to cause chill. [Refer to *Anodynes, Fomentations, Poultices, Sick Room.*]

CHRONIC RHEUMATISM may follow rheumatic fever, but more often comes on gradually in middle-aged people of previous good health. The *symptoms* are stiffness and pain without redness in many joints, especially the knees and shoulders. The general health is often impaired. The chance of recovery is bad, but the risk to life is very small. The *treatment* should be chiefly applied directly to the affected joints. The salicylates, so useful in rheumatic fever, is of but little service in chronic rheumatism. The treatment of the joints themselves consists in the application of counter irritants, e.g., iodine and blisters, or of anodynes, e.g., laudanum or belladonna; in warmth applied by poultices, fomentations, wrapping the joint in

wool, or by hot bags of dry salt or sand; in the combination of hot water and massage used at many of the Spas, e.g., Bath, Buxton, Droitwich, etc. [See *Health Resorts*]; and perhaps, best of all, by the Dowsing System of treatment.

The DOWSING SYSTEM is of comparatively recent introduction. The affected joint is enclosed in a metal case, which is lined by electric lamps. The skin is protected by a piece of lint rendered fire-proof by previous immersion in tungstate of soda. The lamps are then made to glow by turning on the current, which raises the temperature inside the case to 400° F. The enclosed joint is thus exposed to a high temperature for as long as it is thought advisable. The treatment is repeated daily. The whole body, with the exception of the head, is often treated instead of each joint separately. The effect of this treatment is to reduce the stiffness in the joint and to relieve pain. The treatment is suitable for stiff joints from other causes. It is to-day easily obtained in almost any town, and thus saves the need for a journey to a Spa.

RHEUMATOID ARTHRITIS, or Arthritis deformans, is a chronic disease of the joints distinct from both rheumatism and gout, though formerly termed rheumatic gout. Under the name "rheumatic gout" the public include any chronic joint disease, the majority of the cases being rheumatoid arthritis, and the remainder chiefly chronic gout or rheumatism. In rheumatoid arthritis the gristle, covering the ends of the bones, wears away and new bone is formed at the margins of the joints. The joints are thus fixed and distorted. The skin over them is not red or inflamed. No chalk stones develop, as they are peculiar to gout. There are three chief forms of the disease:—

(1) One large joint, like the hip, is alone attacked; (2) a great number of joints are attacked so that the patient is a hopeless cripple, limbs, back, and jaws being all involved; (3) the fingers are alone attacked.

The disease is most frequent at the change of life, but it may begin in young women who are suckling. A rare form also attacks children. The cause is unknown. The disease is incurable. The treatment is the same as for chronic rheumatism. Fortunately the pain, which is often severe at first, usually ceases, and the effect on the general health is little or nothing. [Refer to *Rheumatism.*]

RHUBARB is not prepared from garden rhubarb, but from the root of an allied plant, a native of Tartary. The powdered root in doses of 1–5 grains is used for indigestion, and in doses of 10–20 grains it is an aperient The aperient action is succeeded by a costive action. The compound rhubarb pill of the Pharmacopœia is a useful aperient in cases of indigestion with diarrhœa due to some error of diet. Gregory's powder is a nauseous mixture of rhubarb and magnesia, which is going out of fashion. For infants, a mixture of powdered rhubarb, one grain, bicarbonate of soda two grains, and powdered ginger three grains is a better preparation. For older children two to four times this dose should be given. Or it may be given as a mixture thus:—bicarbonate of soda two grains, tincture of rhubarb five minims, syrup of ginger twenty minims, peppermint water one teaspoonful. To be given thrice daily in cases of indigestion, in infancy, until a free action of the bowels has been produced. For older children, double or treble the dose. Rhubarb stains the urine and motions yellow. Rhubarb taken during suckling is apt to alter the milk and upset the infant.

RHUBARB, GARDEN, is a useful article of diet, except to those liable to gout or gravel.

RIBS, BROKEN, This injury may result from a direct blow, or a crush. The symptoms caused are shallow breathing, with pain on drawing a deep breath. Rarely the broken rib punctures the lung; bright red frothy blood is then coughed up. The treatment should be to tighten the clothing so as to give the ribs support. This may be effected in a man by pinning up the back of the waistcoat. The arm of the affected side should then be placed in a sling, and the patient sent to the doctor. If he is coughing up blood, the treatment must be different, pressure will then aggravate the injury. The patient should then lie down till the doctor comes, or if necessary be carried to him in a stretcher or coster's barrow.

RICE WATER is a form of broth that may be used in invalid dietary.

Take an ounce of rice, an ounce of sugar, and a pint of cold water. Having washed the rice put it in the saucepan with the sugar and allow it to boil gently for one hour, then strain and serve cold.

RICKETS is a disease due to unsuitable food. It is with few exceptions a disease of infancy. The name is derived from the Anglo-Saxon, *wrikken,* to twist awry, and refers to the deformities rickets cause. Although only recognised in the 17th century, when it was regarded as a new disease, rickety skeletons dating from the stone age have been found of late. All young animals are liable to rickets if they are improperly fed, and especially if they are also badly housed. The disease in its more severe forms is most prevalent in the slums, but slighter forms of rickets are only too prevalent in the nurseries of the well-to-do. "The fact that it is abundantly found amongst children of the well-to-do is a grave reflection upon those responsible for their nurture," writes a great authority, Dr. Cheadle. In short, rickets is wholly preventable. Two main causes produce it at the present day. (1) The rich do not bring up their babies on the breast. Patent foods, supposed to be superior to Nature, are substituted. (2) The poor, under the mistaken notion that suckling prevents pregnancy, keep their infants at the breast for months after they should be weaned. The milk in such cases is watery and the need for other food is great, especially when, as often happens, the mother is pregnant whilst suckling. The poor, also, have adopted the patent food craze to some extent. They buy tinned farinaceous foods, shake these up with water, and produce an opaque white mixture not unlike milk to the naked eye and very much cheaper. This mixture, almost wholly indigestible to a young infant, is given instead of milk, whilst the mother is out at work. Aiding and abetting this factor in the causation of rickets are squalor and deficient light. It is not surprising that "Physical Deterioration" is a serious national question.

SYMPTOMS OF RICKETS:—The age of onset is usually between five and nine months. The skin becomes tender, the child is fretful when handled, it kicks off the clothes at night, it loses its energy and puts on pale, pasty fat. Its gain in weight often gives the parents much satisfaction, and convinces them they are feeding it properly. Indeed, the prize winners at "baby shows" are often cases of early rickets, as Dr. Cheadle has shown. Soon after the above symptoms, sweating becomes prominent, specially on the head during sleep, so that the pillow may be soaked with perspiration in the morning; and the hair at the back of the head is worn away partly from being continually wet with perspiration, and partly from a habit the rickety infant acquires of rolling the head from side to side whilst lying on its back. If these symptoms attract no attention, and no treatment is adopted, the disease develops apace. The legs are no longer kicked vigorously about, but are drawn up tailor fashion, and lie there unmoved. Errors of growth next become apparent, the abdomen and the head enlarge, whilst the chest and the limbs are remarkably small. Thus in a marked case the infant, as Trousseau pointed out long ago, assumes a figure of eight shape. The large head is associated with a small face, and the stunted limbs with large, loose joints, The wrists usually are affected first. The large abdomen is caused mainly by chronic distension with wind due to the improper food. The small chest is due to the softened ribs being unable to resist the pressure of the atmosphere. All the bones are lacking in mineral matter, and thus bend readily. The back is often curved, the arms yield to the weight put on them when the infant crawls, and the legs also, if the child is put on its feet; thus bowed legs or knock-knee develop. The child is fortunately backward in learning to walk, thus giving the legs time to recover; the anxious parents, however, find their neighbour's child in advance of their own, and insist on standing the child

up, much to its detriment. The teeth are cut late and decay early. The risk of diarrhœa, inflammation of the lungs and convulsions is great, and death is often due to one of these three causes. If the child escapes these complications, the rickets usually passes off in a couple of years, the bones harden, the digestion improves, and health is regained, though permanent deformity, e.g., bowed legs, pigeon-breasts, deformed hips, stunted growth and defective teeth are only too common.

TREATMENT OF RICKETS. The treatment is two-fold—preventive and curative. 1. *Prevention* consists in feeding an infant properly and giving it its fair share of sunlight and fresh air. There is much need of instruction of the masses in this elementary matter. But little good can be done when once a woman has become a mother; it must be done in school. "Know how to feed a baby! Haven't I buried eight," was the retort of an out-patient to a well-known physician. And this remark is in the writer's experience typical of motherhood in a certain stratum of society.

2. *Curative treatment* is in the main a substitution of correct dietary for the one that has been used. Two special articles of diet are also requisite, (*a*) raw meat juice, and (*b*) some form of easily digested fat, e.g., fried bacon fat, cream or cod-liver oil. Healthy surroundings are also most desirable. The nursery must be airy and well lighted, the house dry, and the climate, if possible, sunny. Poor-Law guardians and others will thus do well to send cases of rickets to such surroundings. The disease takes time to pass off, even under the most favourable conditions. *Drugs do little for the cure of the disease.*

> The anæmia may be treated by steel wine; thus half a teaspoonful of steel wine may be given with the same quantity of cod-liver oil and one-eighth of a grain of bicarbonate of potash to an infant of one year, and twice or thrice this dose for older children, according to age. Parrish's food, "Chemical food," syrup of iodide of iron, syrup of lacto-phosphate of iron and lime are also used. Lime water itself is useless for making bone, in spite of popular belief to the contrary.

Rubbing the back and limbs with sweet oil for ten minutes daily is useful. Morning baths do good, and a handful of table or sea salt may be added to the water with advantage. The child should sit in a warm bath and tepid or cold water be sponged over the back for a few seconds. The child should then be placed on the hearth-rug and dried before the fire with brisk friction with warmed towels. At night it should sleep on a hair mattress and be clad in a combination sleeping suit; the latter prevents it catching cold when it kicks off the bed clothes, as it is sure to do constantly. It must be kept off its legs until the rickets is over or deformity will result. If it insists on trying to walk, which older children do at times, a piece of light lath should be bandaged to each leg and made to project six inches below the foot. By this means standing on the feet is prevented. *Irons and all heavy splints or any remedy designed to forcibly straighten the bent bones are very bad.* If the bones have bent they tend to grow straight of themselves as soon as the child is kept strictly off its feet. If, however, this precaution is neglected, surgical operation or permanent deformity has to be feared in the future. [Refer to *Infant Feeding, Raw Meat Juice, Scurvy-Rickets.*]

RIGOR MORTIS. The stiffness that sets in after death. [See *Death.*]

RING, FIXED. To remove a ring which is firmly fixed on the finger, the latter must be made smaller by expelling the blood it contains. This may be done first by shaking the hand above the head as high as can be reached, and then by bandaging the finger as tightly as possible from the nail upwards. By repeating this manœuvre several times in rapid succession, the ring can often be slipped off with a screw-like motion. If not, some stout packing thread should be wound around the finger from the nail upwards until the ring is reached, one end of the thread is then to be passed under the ring and brought out through it. The thread around the finger is now unwound by using the end that is through the ring; by this action the ring is slipped steadily towards the nail. If this method fails, the file is the only resort.

RINGWORM is a disease due to a fungus that grows in the hair or skin. The scalp is usually attacked. From five to fifteen years is the common age of onset, and fair hair is more prone to attack than dark hair. The disease often requires months and even years to cure, though at puberty it nearly always heals spontaneously. It is *highly contagious* to children, and their attendance at school is thus interfered with, so much so that the London Poor-Law authorities have special schools for pauper children suffering from ringworm. Domestic animals are very liable to attack and often spread the disease. Ringworm begins as a small, red scurfy spot, which itches. It spreads from the centre and thus produces a ring shaped patch, which has given rise to the name. The affected hairs fall out and temporary baldness results. As to *treatment*:—Most authorities shave the head for some distance round the patch, and rub in for ten minutes twice daily ointments to kill the fungus, e.g., sulphur and carbolic ointment in equal parts, or white precipitate ointment and vaseline in equal parts. Stronger remedies, e.g., chrysarobin, formalin, or lunar caustic are also in use, but the inflammation they often cause renders them unsafe, except when their effects are under close medical examination.

> The *domestic remedies* that have been used are innumerable; salt, vinegar, ink, etc., etc. Many of these exert some action in checking the growth of the fungus. Hypo-sulphite of soda a drachm to the ounce of water, applied three times a day may be tried. There can be no question, however, that medical supervision is much to be desired, even though the treatment has often to last for two years.

PRECAUTIONS. The heads of school children should be examined periodically, and any suspicious spot at once reported to the doctor. A child affected with ringworm should wear a skull cap day and night, which should be replaced by a clean one frequently. He must be cautioned not to scratch the affected spot, for by scratching he will convey the contagion to other parts of his body, and start a fresh place. All hats, furs, and the like which the child has been wearing shortly before the ringworm was detected are infected and are best destroyed, the lining of the hats at any rate must be burnt. Brushes and combs should be soaked in strong soda water. The child should never use any brush or comb, towel or pillow, but its own, and these should be washed frequently. The disease often spreads round a family from neglect of this simple precaution. It is, by the way, a good rule to insist on each member of a family having his own brush and comb for the same reason. The finger used to rub the ointment into the ringworm should be protected by the finger of a clean leather glove, or infection may occur.

Ringworm on the body should be treated in the same way. It can be cured easily, usually in a fortnight.

ROCHELLE SALT is a tartrate of potash and soda. From it the well-known Seidlitz powder is prepared.

RODENT ULCER is a growth in the skin allied to cancer, occurring in the elderly. It begins like a pimple, and later becomes a ragged wound or ulcer with a thick edge. The ulcer is usually seen near the eye or ear. It may remain stationary for years, but it is liable at any time to spread rapidly, eating deeply into the tissues beneath. Such a result may arise from the application of caustic ointments. The X rays have been utilised with some success to promote healing, but complete removal by the surgeon is usually the best treatment.

RÖNTGEN RAYS. See *X rays.*

RUBBING. See *Massage.*

RUPTURE is the escape of an abdominal organ from the abdominal cavity. It is the commonest form of Hernia. *Hernia* is the escape of any organ from the cavity which normally contains it. The most frequent form of rupture is the escape of a piece of gut. This may be forced through a weak spot in the abdominal wall either at the navel or the groin. No age is exempt from this accident. When this occurs, a swelling of rounded form makes its appearance at the navel or groin. The swelling disappears when

the patient lies down, and returns when he sits up; the size of the swelling is increased by coughing or crying. The *prevention* of rupture consists in avoiding all causes of strain. Any strain raises the pressure within the abdomen, and so tends to expel a loop of gut through any weak spot. The commonest strains in early childhood are straining at stool from constipation; straining to pass water because a condition requiring circumcision has been neglected; and straining by violent coughing, as in whooping cough. The recent scar tissue of which the navel at this age consists is a weak spot, which readily permits the formation of a rupture, hence it is here that the rupture of infancy is most frequent. In adult life to these strains are added the strain due to the nature of the work, like coal-heaving, or of athletics, like riding or rowing. In advanced life a chronic bronchitis is responsible for many a rupture. In the adult, the navel is not such a weak spot as in the infant, and groin rupture is more frequent in consequence. The *treatment* of rupture consists in returning the gut to the abdomen and of keeping it there by a suitable truss. This must be seen to fit by the doctor. It is unwise to rely on the surgical instrument salesman alone.

THE TRUSS must be worn whenever the erect position is assumed. In the event of this being irksome, an attempt at a radical cure can be made by the surgeon in suitable cases. The truss, however, is soon worn, like the clothes, without knowing it. A second truss should always be kept handy, so that when one breaks a second can replace it. This is of special importance on a holiday or voyage. In childhood the truss should be of a simpler description. For a navel rupture a flannel binder is put on, a cork bung or a disc of lead sewn into it to be placed over the navel. At the same time the cause must be detected and removed. For a groin rupture in infancy a clean skein of wool put round the thigh and then the hips in a figure of eight fashion is used.

STRANGULATED HERNIA. The danger of rupture, if neglected, is not only that it gets steadily larger but that the hole through which it has come may contract, and by nipping the gut prevent its return. This is the condition known as "Strangulated Hernia." The symptoms are vomiting, pain, prostration, stoppage of the bowels; the rupture is found no longer to return to the abdomen when the patient lies down, nor does a cough now increase the size of the rupture. When this occurs, put the patient into a hot bath and send for a doctor. No aperient is to be given, and no attempt is to be made to force the gut back, as this may, in unskilled hands, end in the rupture of the gut and the death of the patient. The treatment when the doctor arrives will consist in an attempt to return the gut; and if the attempt fails, an operation will be necessary. If neglected, the condition is fatal.

ST. ANTHONY'S FIRE. See *Erysipelas.*

ST. VITUS'S DANCE, or Chorea, is a disease of the nervous system, characterised by:—(1) sudden purposeless movements which the will has little if any power to prevent; (2) muscular weakness; (3) a blunting of the intellect combined with a lessened control over the emotions. The name *chorea* is from the Greek "to dance." The name St. Vitus's Dance arose from a large number of cases in the year 1418 being sent to the shrine of Saint Vitus to be cured. In the disease of to-day, however, we can recognise no symptom that resembles the rhythmic movements of a dance, the movements are of the exactly opposite nature, irregular to a degree. The disease is brought on by eye strain, worry and over-work, such as competitive examinations too often involve. The time of life most liable to attack is between five and fifteen years. Girls are more often attacked than boys, poor more often than rich, whites more often than coloured races. Rheumatism plays its part in the causation of the disease; very often the child has rheumatic fever either previously or subsequently, and there is often rheumatism in the family. Indeed there is evidence, as Dr. Poynton has shown, that chorea is rheumatism attacking the nervous system. Girls, who are keen at their bookwork, and who come of a rheumatic strain, are the most liable to become choreic, a fact the parents should bear in mind. A sudden fright finally determines the onset of an attack in many of the cases.

The *symptoms of onset* demand special attention both from the parent and the schoolmaster. At home the child often gets into trouble for behaving badly at table. It spills food on its bib, drops its cup without apparent cause, and often insists on swinging one leg. At school it often gets into trouble for making faces, for inattention, for bad writing, or for a slouchy gait. Amongst its playmates it gets into trouble for its altered disposition. It becomes morose, anxious to be left alone and abnormally emotional when interfered with or chaffed. Ridicule or correction make matters much worse; prompt detection of the real state of affairs is essential if the condition is to be nipped in the bud.

Treatment:—The child should be put to bed by itself for a few days, the sides of the cot should be protected with pillows, all books removed, sleep and plenty of plain food encouraged, and the irregular movements ignored. Many cases thus treated recover in a few days. A fortnight's holiday is then required, with plenty of fresh air and sunshine, but without excitement. Afterwards the child must not be pressed at school or the condition will relapse. In more marked cases, not only the doctor, but a nurse is requisite, and for the poor the hospital is the best place to send the patient. When this is not possible, the use of some enamelled iron cups and plates is desirable; a parson's wife, of the writer's acquaintance, keeps such a set for use in the parish. This little point may be worth bearing in mind.

SALICYLIC ACID, in the form of salicylate of soda, is largely used in the treatment of rheumatism. It must be taken under medical supervision.

SALINE APERIENTS include Seidlitz powder, Epsom and Glauber's salts. [Refer to *Constipation.*]

SALIVA, or spittle, is a fluid secreted by three pairs of salivary glands situated below the chin and in front of the ear. Saliva consists of water, salts, and an active ingredient which changes the starch in bread, potatoes, etc., to sugar. Saliva is essential both for swallowing and speaking, owing to its lubricating effect. It is alkaline in reaction. The salts are prone to be deposited on the teeth in the form of tartar. The quantity of saliva secreted varies. The sight or odour of savoury food makes the mouth "water"; and the presence of food in the mouth causes a similar increased flow. Acids increase the flow. Hence lemonade or an acid-drop relieve a parched throat. All pungent substances, e.g., mustard, ginger and tobacco increase the flow. Certain drugs continued over long periods may cause troublesome salivation, especially mercury. Irritants in the mouth act in the same way; the baby that is teething is a familiar case. Hence, those taking mercury should pay special attention to the teeth and abstain from strong tobacco, so as to avoid two possible stimulants to salivation. The flow of saliva is checked by alkaline gargles, by belladonna, and by removal of all sources of irritation from mouth and stomach. It may also be checked by fear. In the East a thief is at times said to be detected by making all the suspected men eat a mouthful of rice. The thief is supposed to be unable to swallow from lack of saliva.

SALT. Table salt or sodium chloride is essential to life. [See *Food.*]

SALT MEAT. See *Food.*

SAL VOLATILE, or aromatic spirit of ammonia, contains liquid ammonia, carbonate of ammonia, spirit, oil of nutmeg, oil of lemon and water. The dose for an adult is half to one teaspoonful taken in a little water. It is a useful remedy for faintness and for flatulence, but the alcohol it contains should be borne in mind if it is proposed to use it frequently.

SANATORIUM is a home for the preservation of health. The term is used at the present time chiefly in connection with the open-air treatment of consumption, the buildings used being termed open-air or consumption sanatoria. The inclusive terms at these institutions range from two to five guineas a week, though a few charities take patients for less. A list of them may be obtained in a little pamphlet

published by Pulman, entitled "The Doctor's Handy Reference List," or by reference to the Medical Directory or current medical journals. Arrangements should be made for a stay of not less than three months.

SANITAS is a disinfectant prepared by the oxidation of turpentine. Being non-poisonous, it is well suited to domestic use.

SANITATION. See *Public Health, Drains, Sewage Disposal.*

SARSAPARILLA is a drug largely used by quacks, but so far as is known it has no action whatever.

SCABIES. See *Itch.*

SCALD HEAD. See *Favus.*

SCALDS. See *Burns.*

SCALP. See *Baldness.*

SCAR. See *Wounds.*

SCARLET FEVER is an infectious disease due to a germ that has not been discovered at present. Infection arises from contact with, or proximity to, a case of scarlet fever. It is retained in infected clothing for months but it is not conveyed by the air to any great distance. Hence, scarlet fever may be nursed at home quite safely, provided the top floor of a house can be reserved for the purpose. The age most liable to attack, the incubation and the quarantine period are given in a table under *Fevers.* The time of year at which the fever is most prevalent is late autumn. The geographical distribution is curious, as scarlet fever is never epidemic in India, though on the same latitude in the Western Hemisphere it is rampant. The cause of this is an enigma.

Symptoms. At the onset, one or all of three symptoms are nearly always present, viz., sore throat, headache, and vomiting. This group of symptoms in a child justifies isolation for a day or two to see if any rash appears. The rash usually appears on the second day of illness, and is first visible at the root of the neck and upper part of the chest. It consists of bright red dots placed close to each other. It spreads in a few hours to the whole body, and is often well marked near the arm-pits and groins. The face is usually flushed with well-marked pallor round the mouth. There is rarely any rash on the palms or soles. The tongue is coated with white fur. At the tip of the tongue little red points the size of a pin's head stand out through the fur. The pulse is very rapid and the temperature raised. Such symptoms demand strict isolation until the doctor can be obtained. Occasionally indigestion with nettle rash in a child, or German measles is mistaken for scarlet fever by the layman, but in all doubtful cases no harm can be done by isolation until the doctor's arrival.

Period of Infection. The rash and temperature both subside in five or six days, and peeling of the skin then begins at the root of the neck and on the ears, and spreads slowly to the rest of the body. Peeling is completed in about six to seven weeks, the palms and soles taking the longest time. It is customary to regard the case as infectious until the peeling is completed. There is evidence against this. There is also evidence that cases with discharge from the nose or ears are infectious so long as the discharge continues. The responsibility of stating a case is no longer infectious can thus only be taken by a doctor. A mild case of scarlet fever properly nursed causes but little suffering and the risk to life is slight. Severe cases, however, are apt to be followed by troublesome complications, of which ulceration of the throat, discharge from the ears, inflamed glands in the neck and inflammation of the kidneys are the chief.

The *treatment* should in all cases be in medical hands, and one hospital nurse for the first three weeks at least, besides the mother, are required to manage the case satisfactorily. If this cannot be afforded, the hospital is the best place to send the patient. The mother or whoever takes her place as assistant nurse will find instructions for her guidance in the article on the *Sick Room.*

When no medical or nursing aid is obtainable, the following points should receive attention in addition to those given in the article just mentioned:—

(1) Fresh air is the chief disinfectant and the chief medicine required. (2) Confine the patient to bed while the temperature is up, making use of the bed pan when necessary. After the temperature has fallen allow the patient up to attend to the calls of nature and to have the bed made, but keep him in bed between whiles for ten days from the onset of the illness. (3) Every two hours by day and every four by night give milk and soda water in equal parts. Between whiles allow the thirst to be quenched with water, lemonade, or other beverage mentioned under *Cookery*, as often as the patient likes, but never give milk between the stated intervals, and only give alcohol as a last resort. After the temperature is normal the diet should be increased by the addition of eggs, bread and butter, and milk puddings, and a few days later by fish, and then meat. Oranges and grapes are useful. (4) If the patient has a house and garden to himself he will be ready to go out in the sunshine after three weeks indoors, but if he is isolated at the top of the house from people living beneath he must remain there until all peeling has ceased. (5) After the temperature has been normal two days a warm bath may be given on alternate nights. It aids peeling and soothes the skin. Care must be taken that chill is not caught after it. When the temperature is above 104° the patient should be bathed with tepid water for ten minutes every four hours. (6) In severe cases mop out the throat every two hours with a little wool securely fixed to a penholder, and dipped in glycerine and water in equal parts. Use a fresh piece of wool each time, and burn the soiled piece at once. (7) If the neck swells wrap it up in a large pad of wool that reaches from one ear to the other and passes beneath the chin. Tie this on with a handkerchief. (8) If ear-ache occurs pour into the ear a few drops of a mixture of warm olive oil 7 parts and laudanum 1 part. Do this every four hours and keep the ears wrapped up between whiles. When the ear discharges the pain is relieved. A pad of wool should be kept over it, changed twice daily so long as discharge continues. It should be syringed twice daily with warm water containing a teaspoonful of salt to the pint. This ear discharge usually lasts some weeks. The deafness that often accompanies it is rarely permanent.

Special Precaution. The onset of inflammation of the kidneys must be watched for even in the mild cases. During the third and fourth weeks is the common time. The water should be poured into a glass and held up to the light daily. A rust-red deposit that has been aptly compared to the dregs of beef tea is an early symptom. In more serious cases the urine may be smoky or port wine coloured. If such symptoms occur the patient must be put to bed at once, clad in flannel, and must remain there until the urine has been normal for at least three days. The diet in the mild cases should be ample, accompanied by an increased amount of water to drink, and the exclusion of alcohol. In the severe cases, namely, with scanty port wine coloured urine, the diet should be chiefly milk, with plenty of water to drink; and linseed poultices should be applied to the loins every four hours. Other symptoms to watch for that may indicate the same condition are pallor, vomiting, puffiness about the face, ankles or privates, and sudden rises and falls of the temperature. They demand the same treatment. If they are ignored, death from convulsions, heart failure or suppression of the urine is likely to result. In conclusion, permit us to insist that the chief preventive of the complications of scarlet fever is fresh air and plenty of it. [Refer to *Disinfectants, Fever, Sick Room.*]

SCIATIC NERVE is the stoutest nerve in the body. It runs from the lower end of the backbone through the pelvis to the buttock, and thence down the back of the thigh, where it divides into branches that supply most of the skin and muscles of the leg and foot. At its upper end it is so strong that it can support the weight of the whole body.

SCIATICA is neuralgia of the sciatic nerve and its branches. It occurs chiefly in middle-aged men. It is caused by exposure to cold or wet, or to pressure, as in sitting on a hard seat. It is also often due to constitutional disorder, e.g., gout, rheumatism, debility or ague. As the lower bowel is in proximity to the nerve at one point, constipation may cause sciatica by the pressure of the overloaded bowel on the nerve. The *symptoms* are pain, which is made worse by any act that puts the nerve on the

stretch, such as bending down to tie up the shoe, and also by an action of the bowels. The pain comes and goes, being often present even when the limb is at rest. It is distributed over the branches of the sciatic nerve; usually it is felt at the back of the thigh, but occasionally in the calf, ankle, or even in the great toe. The skin may be numbed in places and tender elsewhere. It is always limited to one side. It has to be distinguished from muscular pains, from which it differs in being present when the muscles are at rest. In childhood, symptoms like sciatica are nearly always due to hip disease, and require immediate medical care. Pain resembling sciatica at any age when present on both sides is generally due to some serious condition in the bladder, rectum, or spinal cord, and also requires medical care. The *treatment* for sciatica should be rest, a free purge, and counter-irritation over the painful region.

> Counter-irritation may be applied by rubbing in camphorated oil, compound camphor liniment, or turpentine liniment, or by the application of mustard leaves, or by a row of small blisters which should be removed as soon as redness of the skin has been produced, and repeated every few days.

Another treatment is to apply several folds of brown paper, and then iron the thigh with a laundress' iron applied as hot as it can be borne. If the patient is gouty, rheumatic or the subject of ague, the medicine recommended for these may be tried also. The condition often requires some weeks of treatment, and should be in medical hands, if possible, as more powerful modes of treatment can then be resorted to.

SCIRRHUS is a hard cancer.

SCOTT'S OINTMENT is composed of mercurial ointment with camphor oil and wax; it is applied over organs which are the seat of chronic inflammation, such as enlarged glands in the neck, to hasten their recovery.

SCROFULA is an old-fashioned name for the hereditary tendency to tuberculous glands in the neck. Until the discovery of the tubercle bacillus in 1882, it was not known that consumption and chronic enlarged glands in the neck were due to the same cause. Hence some people were said to be consumptive and others scrofulous, whereas both are alike the victims of tuberculosis [which see].

SCURF. See *Dandruff*.

SCURVY is a disease due to a defective dietary, characterized by hæmorrhage, swollen gums, affection of the bones, anæmia and exhaustion, with absence of fever. Lack of fresh animal and vegetable food is the cause. Malaria, dysentery, overcrowding, and mental depression aid in causing the disease. The disease is now prevented on long voyages by the administration of lime juice, and the use of fruit and fresh vegetables whenever possible; failing oranges and green stuff, the onion and the potato are specially valuable for this purpose. Dried peas and beans are useless.

SCURVY RICKETS, or infantile scurvy, is scurvy attacking infants who have been fed on tinned foods only or on boiled milk. These articles of diet lack the ingredient which prevents scurvy in those fed on the breast or on fresh milk. As the name implies, rickets is often present also, but the disease is essentially scurvy. The same earthy complexion, with absence of fever, spongy gums, hæmorrhages from the mouth, under the skin, and on the surface of the bones occurs. A bone affected in this way is intensely tender, the child screams when it is touched, and the limb is held as still as if it were paralyzed. The disease may be prevented by feeding the infant properly. Humanized milk should not be used over long periods. Milk should be Pasteurised to sterilise it instead of boiling it thoroughly. A teaspoonful of orange juice may be given occasionally. After the ninth month a teaspoonful of well-cooked floury potato passed through a sieve may be added to one or two feeds daily. The disease is most often met with amongst the children of the rich. The recognition and treatment of the disease is a matter for the family doctor. [Refer to *Infant Feeding.*]

SEA SICKNESS, or *mal de mer*, is a temporary disturbance of the bodily functions caused by the motion of a ship. Those made sick easily by other causes are the most prone to suffer. As a rule, women suffer more than men, whilst the very young and very old often escape. The duration of the attack ranges from three to five days, though in exceptional cases it may persist for weeks. The *symptoms* consist at first in pallor, coldness of the extremities, an indisposition to be disturbed, and uneasiness at the pit of the stomach; these symptoms are soon followed by headache and generally by vomiting. The vomiting often gives temporary relief, but it may recur sufficiently often to cause exhaustion. The *risks* of sea sickness are not great. Those with heart disease are not specially endangered but people who are ruptured and those of a bodily habit suggesting the risk of apoplexy, should think twice before exposing themselves to the effects of prolonged vomiting.

The *treatment*. For a few days beforehand attention should be paid to the general health; the diet should be spare and the bowels freely open. Three hours before going on board, a plain but substantial meal should be taken, at which some alcohol is also taken. On going on board, a deck chair should be secured, placed as near the centre of the ship as possible. In this the traveller should recline, with the extremities well wrapped up, and with the eyes closed. He should breathe deeply. As soon as nausea is experienced, a lemon may be sucked or a dry biscuit or cloves may be eaten slowly. If nausea persists without vomiting, relief may be obtained by a dose of brandy, a cup of tea or a drink of sea water, which act alike as emetics in this condition, and often bring the desired relief. If vomiting persists, ice to suck, sips of champagne, or small quantities of lemon juice and soda water may be tried. In *short trips*, beyond nibbling a biscuit, it is well to abstain from food. In *long voyages*, beef tea, jelly and barley water should be tried, and will often be retained; and determined attempts to get used to the ship's motion by walking about on deck, shouting, singing and the like, should be made. Of the drugs recommended, few are of much use, and the traveller is best without them. In very severe cases the ship's doctor may have to resort to cocaine or opium, but this should be left to him. On landing, many people feel the motion of the ship for some time. Rest and food should be first tried, and then if the sensation persists, a couple of compound rhubarb pills will be found an efficient remedy.

SEASIDE, DANGERS OF. In taking a holiday by the sea in a crowded holiday resort, certain dangers are incurred. Families often crowd into lodgings far smaller than those they are accustomed to at home, and if the weather is wet, they live in an atmosphere by no means conducive to health. The sanitary arrangements are often primitive or out of order. The food is often prepared in insanitary surroundings. The lodgings have often just been occupied by people convalescent from measles or other infectious fever, often without the knowledge of the landlady. Such people are also often present in the shelters on the sea front. The beds are often imperfectly aired and the bedroom may have been shut up for some time. Watercress and shell fish are often partaken of more freely than at home. Both articles of diet are apt to be contaminated with the germs of typhoid fever. The sea air promotes constipation, and this, coupled with the increased food eaten, often upsets the digestion, if suitable aperients are not taken. Children are often allowed to paddle bare-headed under a fierce sun, quite contrary to their custom at home.

Much illness can be avoided by the exercise of more care and common sense in the choice of lodgings. Instead of merely finding out whether they have a sea view, would it not be as well to ascertain if the water is pure, to see if the cistern has a lid, and to inspect the lavatory? Is the house free from damp and well ventilated? Or are the window-sashes fixed to save the curtains, and the chimney register shut to protect the decorations of the fire-place? It is desirable, if practicable, to inspect the kitchen and larder to see that the food is prepared and kept under sanitary conditions. Lastly, it should be remembered

that harm is often done by a sudden change in the daily habits; long walks and large meals at unaccustomed hours not unnaturally do more harm than good. [Refer to *Health Resorts.*]

SEASON at which each fever is most prevalent is stated under each.

SEA VOYAGE. See *Health Resorts.*

SEBACEOUS CYST, or *wen*, is due to the mouth of a sebaceous gland becoming blocked. [Refer to *Cyst.*]

SEBACEOUS GLAND is an oil-gland, two of which are connected with the socket of each hair. [Refer to *Acne, Hair, Skin.*]

SECRETION. See *Gland.*

SEDATIVES are remedies which reduce the activity of any organ. [See *Baths, Drugs.*]

SEDENTARY HABITS promote constipation, torpid liver, piles, gout, obesity, irritability of temper and sleeplessness.

SEIDLITZ POWDER. The blue paper contains carbonate of soda mixed with Rochelle salt, which is a double tartrate of potash and soda. The white paper contains tartaric acid. On mixing the contents of the two papers in water effervescence occurs. The powder should be taken before breakfast, as its aperient effect is soon produced. [Refer to *Constipation.*]

SENDING FOR THE DOCTOR. Always send, if possible, before the doctor has started on his round. Otherwise he may pass your door, and on reaching home find he has to retrace his steps. Except in midwifery cases, the fee for a night call is double that for a day call. In the case of rashes, the sooner a doctor sees them the better, though a definite opinion must not be expected until the rash is fully out and has been seen in daylight. In cases of accident send a written message, stating its nature. The doctor will then bring the necessary dressings, etc., with him, and much valuable time will be thus saved. In all cases send a written message with the name and address written in full. It is quite common for a child to come and ask the doctor to call at "mother's," without being able to give any further information. [Refer to *Doctor.*]

SENNA is a drug with an aperient action and nauseous taste. The chief preparations are syrup of senna, dose, one half to two teaspoonfuls; confection of senna, half to one teaspoonful; black draught, two to four tablespoonfuls; and senna tea, two to four tablespoonfuls. The last may be prepared by pouring a pint of boiling water on two ounces of senna and a teaspoonful of ginger, and, after allowing to stand in a warm place for half an hour, straining.

SEROUS MEMBRANE is a membrane that secretes a watery fluid resembling serum. The purpose served by this fluid is to lubricate the surfaces of organs which glide over each other. Thus the inside of the abdominal wall and the outside of the stomach and intestines are lined with a serous membrane—the peritoneum.

SERUM is a clear straw-coloured fluid, not unlike whey, which is produced by the clotting of blood. Blood when shed turns to a solid portion or clot, and a liquid portion or serum. The serum of animals that have been rendered immune to diphtheria contains antidotes to diphtheria poison known as antitoxin. It is this serum, known as antidiphtheritic serum, or more briefly as antitoxin, which is injected under the skin of patients suffering with diphtheria, in order to cut short the attack. The same mode of treatment is capable of application to many other diseases as soon as research has overcome certain difficulties in the technique. [See *Antitoxin.*]

SETON is a bundle of silk threads passed through the skin and left in so as to produce a festering sore. It is an obsolete method of applying counter-irritation over an inflamed or painful region.

SEWAGE, DISPOSAL OF. In towns a system of sewers for carrying off the soiled water from bath-rooms and kitchens is necessary. Hence the excreta can readily be removed by the same sewers, and in towns there is little doubt that a water-borne system of sewage disposal is the best. Other methods, however, have been tried and are still in use; of these the pail system is the chief in England. By this system the excreta are allowed to collect in pails, which are removed at regular intervals by the Sanitary Authority. In most varieties of this system some powder is added to the pail, in order to soak up the urine; of these powders the house ashes are a convenient one, though they have the disadvantage that they destroy the value of the contents for manure. In rural districts the disposal of excreta is in many places still very bad. The worst plan consists in digging two holes in the cottage garden, one of which is the well, from which the house draws all its water, and the other is the cess-pool. Yet this plan is still widespread, though obviously dangerous. Probably the best plan is a pail system, in which dry earth is used in the pails, and each cottager empties the pail and buries its contents in his garden at intervals of not more than three or four weeks. It is difficult, however, to secure that this is done regularly.

When a water-borne system is adopted the disposal of the sewage becomes an important problem, for if the crude sewage is run into the nearest river, serious pollution occurs. Hence many methods for treating the sewage have been suggested so that the effluent shall be rendered harmless. One method is the distribution of the sewage by irrigation works over farm land—the SEWAGE FARM method. The farm area necessary, however, to receive the sewage of a large town is very great, and the value of the irrigation to the land from a farmer's point of view falls very much below the cost involved. Hence for large towns this method is too expensive. *Chemical Precipitation* is another method. Here the fluid effluent discharged into the river is rendered harmless by precipitating the offensive material with lime, iron salts, etc. The difficulty then is to get rid of the precipitate. Lastly, the LIQUEFACTION or SEPTIC TANK process has been introduced. In this method the sewage is first kept for twenty-four hours in a closed tank, termed the septic tank, in which active bacteria live, that would be destroyed by air or light. The action of these bacteria is to liquefy the solid parts of the sewage. The liquid sewage then passes over layers of coke, in which it is freely exposed to the air. Here other kinds of bacteria live, which oxidise the organic matter in solution and produce from it harmless bodies. The sewage is then free of odour and harmless to fish, and may be discharged into the nearest stream. The drawback to this method is that although dead organic matter is rendered innocuous, yet many living bacteria, e.g., those of typhoid, if present in the original sewage, will pass through alive and active and thus pollute the stream and any shell fish that may be living in it. The septic tank, then, though a great advance on former methods, leaves much to be desired.

SHELL FISH. See *Food, Public Health, Typhoid Fever.*

SHINGLES, or **HERPES ZOSTER,** is a disease of the skin characterised by a row of blisters limited to one side of the body, in the area of distribution of a nerve. Around the waist or chest is the usual position. The skin beneath the blisters is red and burning; neuralgic pain usually precedes the appearance of the rash; the rash itself lasts from three to ten days. The blisters burst or dry up to form scabs, and the skin recovers. The cause is unknown. The treatment should be the application of zinc ointment spread on clean linen and fastened on. The popular belief that if shingles encircle the waist death results, is merely another way of saying that shingles always affect one side only. Recovery is certain. Medicine is not required. Herpes on the lips or inside the mouth is a distinct disease; it occurs on both sides of the midline as a patch of blisters on an inflamed base. This condition is common at the onset of many fevers, e.g., pneumonia. The treatment, so far as the herpes is concerned, is the application of zinc ointment. Recovery is more rapid than in *herpes zoster.*

SHIVERING is due to irritation of the nervous system by many different causes, some of which are trivial, others serious. The causes fall into three groups:—

(1) mental, e.g., fear; (2) irritation of the skin or mucous membranes, as in exposure to cold, or the passage of water

—which in many healthy people is accompanied by a slight shiver—or the passage of a gall stone; (3) poison in the blood, as in the presence of matter pent up within the body, or at the onset or in the course of many fevers, especially pneumonia and ague.

The duration of shivering varies from a few seconds to a couple of hours, and is often succeeded by sweating and flushing. The temperature of the body as a whole is usually rising during a shivering attack, although the patient feels cold, and it is falling during the flushed, sweating stage, although the patient then feels hot. In children the more serious causes which produce shivering in the adult often cause convulsions. The *treatment* during the shivering should be hot blankets, hot bottles, hot drinks, and during the subsequent hot stage in which the patient is sweating, the skin should be sponged with tepid water, and plenty of cooling drinks allowed. The subsequent treatment will depend on the cause of the shivering. Death never occurs during a shivering attack.

SHOCK is a disturbance of the nervous system, caused by painful impressions on the body or the mind, which affect specially the heart and circulation. The symptoms and treatment are similar to those of fainting given under *First Aid.*

SHORT SIGHT. See *Sight.*

SICKENING FOR AN ILLNESS, the nature of which has not yet declared itself, is a condition which every parent is sure to encounter. The treatment in such cases cannot be guided by the nature of the illness, and we have to adopt, therefore, a course of procedure suited to all illnesses, and one which can in any case do no harm. We recommend the following:—

(1) Always inspect the THROAT in the way described under *Sore-throat*, even though the patient does not call attention to it. If anything is seen that raises a suspicion of diphtheria, not a moment must be lost in consulting the doctor.

(2) Take the TEMPERATURE, and it if be found above normal, put the patient to bed at once, though there is no need for alarm at a temperature of three figures in a child, as the least ailment may present this symptom. When the temperature is not raised, there is no harm in confining the patient to bed, but keeping to one room is, as a rule, sufficient. The same evening the temperature should be taken again, as it may be raised at this time, although not above normal in the morning. [See *Temperature.*]

(3) In the case of children, secure the ISOLATION of the invalid until the illness is known not to be catching.

(4) Do everything to secure REST; rest is the great healer. Encourage sleep, put the mind at ease by quiet, though cheery surroundings, and discourage much reading. Adopt a spare diet for the same reason; the digestion is sure to be disturbed and requires a day's rest to recover.

Two pints of milk and one of beef tea, with a little bread and butter, or toast, is all that an adult requires for a day or two, and children may be given the same diet in rather smaller quantities. The milk should be diluted with barley water or aerated water, and food must be given every four hours during the day with nothing between meals except water to quench thirst.

It is a common mistake to give milk whenever the patient is thirsty, with the result, as a rule, that any indigestion already present is much increased. On the other hand, there is a strong popular prejudice against the free use of cold water, whenever a child is feverish. A feverish child is all the better for frequent draughts of cold water in small quantities at a time; a two ounce medicine glass, holding four tablespoonfuls, forms a convenient drinking cup, which the child may be allowed to drain each time. Acid drinks, such as lemonade, black currant water, etc. (see *Beverages*), are also often grateful to the patient, but they cannot be allowed with the same freedom.

(5) Give little MEDICINE, if any. If there is constipation, a mild laxative should be given; castor oil is the safest, but the aperient to which the patient is accustomed may usually be administered. (See *Constipation.*) While the temperature is raised, an effervescing draught may be given every four hours with some benefit, though it is not essential; such a draught may be made of a saltspoonful of bicarbonate of soda dissolved in a little water stirred up with the same quantity of citric acid, also previously dissolved in a little water. Within thirty-six to forty-eight hours of this treatment, the temperature will fall and convalescence begin in the great majority of cases, and the attack will prove to be a false alarm. The diet should then be increased by the addition of lightly-cooked eggs and of fish, and if no further symptoms occur the patient may get up on the following day. If, on the other hand, there is either no improvement, or fresh symptoms, e.g. a rash, a cough, etc., make their appearance, medical aid should be obtained.

SICKNESS. See *Sea Sickness, Vomiting.*

SICK ROOM, MANAGEMENT OF. The *room* selected for most illnesses should be well lighted, the sunny side of the house being the best except in very hot weather. In certain cases of brain injury or excitement, and in many eye troubles, the room will have to be darkened, but in practically all other forms of illness the cheering effect of light should never be forgotten. The room should also be quiet, a fact which may necessitate one at the back of the house being chosen. In many illnesses a room next door for the nurse is required, and the proximity of a lavatory is another point to be considered in choosing the room. For infectious disease the whole top floor is nearly always reserved for the patient and nurses, whilst for cases of prolonged illness, e.g., heart disease, in which a turn in the garden may be allowed daily, but in which mounting stairs is dangerous, one of the ground floor rooms will have to be converted into a bedroom. The wall paper should be of a subdued pattern, the furniture scanty, and all unnecessary curtains, bed hangings, and other dust traps removed. Fresh flowers without too pronounced a scent are better than pictures for decorative purposes. Except in infectious and certain surgical cases, the removal of the carpets is unnecessary.

1. THE BEDROOM APPLIANCES necessary for nursing the sick must be obtained. The bed chosen should, if possible, be narrow, so that the patient can be easily reached and lifted; the mattress is best a hair one, lying on a wire-spring frame, and in any case a feather-bed should never be used, as the patient can be moved on this only with difficulty, and it is apt to cause bed-sores. The sheets should not be linen, as this is too chilling. The hair-mattress should be covered by a blanket and sheet, and a draw sheet placed across the bed with, if necessary, a square of mackintosh beneath it, kept in position by a safety pin at each corner.

A draw sheet is made by folding a sheet till it is three feet wide, and placing this across the bed, so that one end just comes to the right hand edge of the bed, whilst the majority of the sheet lies on the floor on the left side. This free end is folded up and tucked in beneath the mattress. As the sheet becomes soiled it is drawn across the bed towards the right and the soiled part tucked in on the right side. This manœuvre is repeated each time the sheet is soiled, until all the sheet has been drawn across the bed to the right side. A new sheet is then substituted, having again the spare portion at first on the left side.

In addition to the bed and bedding, hot-water bottles wrapped in flannel, a bed-rest and a bed-cradle, are often required. *Bed-rests* are usually made with an adjustable back, so that the patient may recline at any angle he likes. A pastry board covered by a pillow may serve as an extemporary bed-rest. A plank on four legs, about eight inches high, is useful to place in front of the patient for meals, toys, etc. *Bed-cradles* are used to take the weight of the bed clothes off the feet or some injured part, and are usually made of hoops of metal or wicker work fixed in a frame, and can be easily made by any one at all handy at carpentry, or might be made of stiff cardboard bent into a half circle. *Bed-pans*, night table, and a glass urinal with a wide mouth so as to be easily cleaned should be provided. A *thermometer* should be hung over the head of the bed, and a clinical thermometer for taking the patient's temperature will be required. *Medicine glasses*, feeding cups, a small spirit lamp and kettle, washing materials, and an enema syringe should also be handy. When poisonous lotions are being

used as well as medicine, it is much safer to keep the former locked up in quite a different place to the medicine, as mistakes are made more easily than the beginner thinks. A *note book* and pencil should be provided in which to keep accurate notes put down at the time and not from memory.

2. THE NURSE must be clean and neat; she must have no rustling skirt, creaking shoes, or rattling bangles. She must be bright, cheery, punctual in giving meals and medicines, and capable by tact and quiet firmness of seeing that these are taken properly. Anxiety must not be allowed to cause fussiness. She must carry out the doctor's instructions faithfully, and if she does not understand them she must say so at the time, and she will be wise to write them down at once, as in the strain and anxiety of nursing a near relative, the memory is rarely reliable. She must keep notes of the pulse rate, the temperature and the breathing rate, if desired, and should also note when the patient sleeps, how he takes his nourishment, how often the bowels and bladder act, and any symptom such as pain, cough, vomiting, or rash. A small portion of the vomit, expectoration, urine, and motions should be reserved for the doctor's inspection, and should be kept in a cool place outside the sick room.

The nurse is responsible for the *ventilation* and warming of the sick room. Ventilation must always be into the outside air, and is best effected by a bright fire and by a window open at the top. The wall thermometer must be the guide as to the amount of fire used. To keep the temperature up to the right level by diminishing the ventilation is bad nursing. The usual temperature for the sick room is 55° in winter and 65° in summer; but in nursing bronchitis the temperature may be a little higher, and in surgical cases often a little lower than the average. In illness involving the emission of sickly odours the room must be kept sweet by more abundant ventilation, and not by disguising the fœtor by other and stronger scents. This point is essential to the welfare both of nurse and patient. The fear of draughts, which took so prominent a place in the mind both of relatives and doctors of the last generation, is now largely a thing of the past, except in the treatment of bronchitis and some diseases of the kidneys. The open-air treatment, so beneficial in consumption, is extending to illness in general. The fire should be poked with a stick and coal put on by hand to avoid noise; a pair of gloves are usually kept for this purpose.

Bed-making has often to be done without removing the patient from the bed. The bed-linen may be changed in the following way:—

> The patient is turned on his side and brought to the edge of the bed, and the part of the under sheet and drawsheet thus exposed is rolled up lengthwise till it lies against the patient. The clean sheet and drawsheet are also rolled lengthwise for half their width, and the open half is then spread over that part of the bed from which the old sheet has just been removed. The rolled portion of the new sheet is then in contact with the rolled part of the old sheet, and the patient is now lifted on to the unrolled portion of the clean sheet. The old sheet is then removed and the remainder of the new one unrolled.

In removing body linen it is well to draw it over the head, taking the arms out last; but in putting on fresh linen it is better to put the arms in first and then to slip the shirt over the head and down the back. The prevention of bed sores will depend largely on the skill with which the bed is made, and the bed and body linen kept dry. Crumbs must on no account be permitted in the bed. [Refer to *Bed-sores.*]

Lifting patients is best done in a blanket, but in lifting them further up the bed the best method is for two people to pass their hands from opposite sides of the bed under the shoulder blades and buttocks and to lift simultaneously, whilst a third assistant, if necessary, supports the patient's head.

Management of the *excreta.* Care must be taken that thorough dryness be secured, which is best done by using a dusting powder, such as starch and zinc oxide in equal parts. The excreta should be at once removed from the sick room, and not hidden under the bed or emptied into a slop-pail. In certain fevers the excreta require disinfection before emptying, but as a rule they may be emptied at the water-closet at once, a small sample being reserved for the doctor's inspection. The expectoration in consumption or pneumonia should be received in a vessel containing some disinfectant, such as sanitas or chinosol, and the lips wiped with a soft rag, that is subsequently burnt. Any blood or offensive odour in the expectoration should be noted. [Refer also to *Baths, Blisters, Catheter, Cookery, Dressings, Enemata, Food, Infancy, Leeches, Poultices.*]

3. SPECIAL CASES. (1) In nursing a case of *fractured leg* or thigh the bed is prepared by placing boards across the bed beneath the mattress to prevent any subsequent sagging. The limb having been set, subsequent swelling may cause the bandages to become too tight; it will then be proper to give relief by making a slight snip with scissors into the edge of the bandage. Later in the illness pain at the heel or elsewhere may indicate the necessity to readjust the splints; this symptom, then, should always be reported to the doctor. Some aching in the limbs, however, must be expected, owing to the necessity of lying in one attitude. The use of the bed pan and the prevention of bed-sores require special skill in these cases.

(2) In nursing a case that presents *mental* symptoms special care is required. Two attendants should always be present, and if the patient be strong, more than this number may be required. Razors, knives, forks, glass, fire, and even bell ropes are all sources of danger. In holding the patient when struggling his skin should be protected by holding him in a blanket. [Refer to *Delirium Tremens.*]

(3) In nursing a case of *infectious* illness the top floor should be selected for the purpose, and on this floor patient and nurses must live isolated from the rest of the family. Domestic pets must be excluded. The room should be stripped of all pictures, carpets, and other furniture except the barest necessaries, which should be of such a nature as to hold the dust as little as possible. A sheet soaked in some antiseptic, such as perchloride of mercury, 1 in 2,000, should be nailed over the doorway and allowed to hang down outside it. This antiseptic, though more expensive, is preferable to carbolic, because it is odourless. A gown should be kept for the use of the doctor on his visits. The dress of the nurse should be washable. Ventilation should be thorough, but this must not be aided by opening the door: the windows and chimney should alone be used. All attempts to disinfect the air of the room by trays of carbolic or other chemical are futile, and only give the room an unpleasant and unhealthy odour. Crockery must be washed by the nurses themselves, and no letters posted. Soiled linen must be soaked in a strong disinfectant before being sent to the laundry. Food must not be allowed to stand in the sick room, and when once it has been taken into the sick room, if not used, it must be burnt. The nurse's meals should be taken outside the sick room, and the hands should be carefully cleansed first, though the use of medicated soaps is not recommended. Arrangements should be made, if possible, for each nurse to have at least an hour a day in the open air, the clothes being completely changed before going out. In illness of this kind, as in all serious illness, the aid of at least one hospital nurse is of great value. The other members of the household should try to work amicably with her, and to take her advice in all cases of doubt when the doctor is absent. When friction arises it is usually the well-intended but highly unnecessary fussiness of the relatives that is at fault. [Refer to *Disinfection, Typhoid, Scarlet Fever, etc.*]

SIDE. PAIN IN. If due to pleurisy, this pain is increased by taking a deep breath. If due to indigestion, it is not affected by breathing, but is worse after meals. It is also due at times to muscular rheumatism. [Refer to these separate heads.]

SIGHT. Normally we are able to focus for near or distant objects with equal facility until middle age is reached, when most people require spectacles to enable them to see clearly small objects at a short distance. Such

people are said to be long-sighted, as any distant object is seen as well as ever. The time to take to spectacles is indicated by the position in which a newspaper has to be held to read it. As long sight develops the paper has to be held further and further from the eye, till it is held at arm's length. Spectacles should be obtained before long sight has advanced so far. Short-sighted people, on the other hand, can see near objects but not distant ones distinctly. Short-sight may date from birth, but is more often produced by too close an application to reading, embroidery, or other work that involves eye strain. It is very rare in savages. The defective sight is easily remedied by suitable glasses, which cannot be worn too young, as the short sight will otherwise increase. The commonest error of vision is not short sight, but astigmatism, which is treated under a separate heading. [Refer to *Astigmatism, Blindness, Eye, Squint.*]

SINKING SENSATION at the pit of the stomach is due to indigestion. It is not a sign that stimulants are required. It is largely used as an excuse for alcoholic indulgence, which by increasing the indigestion makes the symptom recur with increased frequency. [For treatment see *Indigestion.*]

SINUS is a passage, produced by disease, blind at one end and opening on to the surface of the body at the other. Disease of a bone is the most common cause; the matter makes its way to the surface, leaving a track, through which discharge continues until the diseased bone has been removed. The treatment is surgical.

SKIN forms a protective coating over the whole body. It is popularly thought to consist of three layers, but really only consists of two:—the cuticle, scarf-skin, or epidermis above, and the true skin or dermis beneath. The *epidermis* is devoid of nerves and blood-vessels, so that it stands wear and tear without bleeding or causing pain. In order to withstand the constant wear to which it is exposed, it is formed of several layers of scales, which are renewed beneath as fast as they are rubbed off at the surface. The greater the friction the greater the scale formation; hence arise the "horny hand of toil," corns, etc. The *dermis* or true skin is richly supplied with blood-vessels and nerves. To the latter the sense of touch is due. Deep in the dermis are the sweat glands, which pour the sweat into canals or ducts that open on the surface of the skin; the openings of these ducts are the pores of the skin, which are visible through a strong magnifying glass. The chief purpose served by the sweat gland is to aid in regulating the temperature of the body. As the body becomes heated the formation of sweat is much increased, and this in the course of evaporation chills the skin and the blood flowing through it. The skin contains hairs. These grow in little pits in the skin called *hair-follicles.* As soon as a hair has attained a certain length, which varies with the individual, it is cast off and replaced by a young hair that grows up beneath it. From disease or advancing age the follicles may cease to produce new hairs, and baldness results. Opening into the follicle are two oil glands, the sebaceous glands, the purpose of which is to oil the hair and the surface of the skin. Attached to each follicle is a small muscle, which, under the influence of cold or fright, makes the hair stand on end. The condition termed goose-flesh is thus produced. If dirt is allowed to collect on the surface, the mouth of the sweat glands and the sebaceous glands become blocked, and their secretions are pent up.

1. CARE OF THE SKIN is of much importance to health. The skin must be kept clean, but harm can be done by over-washing. It will be noted from the above that the skin is provided with oil glands to keep the skin lubricated, and while this oil must not be allowed to accumulate and turn rancid, it must, on the other hand, not be removed so frequently that the skin is kept dry and brittle. Many of the soaps used contain free alkali, which does harm in this way. In raw weather many people with delicate skins, who have to go out directly after breakfast, do well to wash the face at night but not in the morning. During the night a protective coating of natural oil collects, which protects the skin from being chapped. In such cases also the use of a super-fatted soap is worthy of a trial; that is, a soap that contains an excess of fat. Such soaps, if kept a long time in warm weather are, however, apt to turn rancid, and are then very irritating. Most skins stand the morning cold bath without soap very well, but they will not all withstand the vigorous rub down afterwards with hard, rough towels. To cleanse very dirty, coarse, thick skin the use of soft soap, turpentine, and methylated spirit will be found effective. In cold weather those who have to wash the hands frequently require care in order *to avoid chaps.*

These are best avoided by (1) washing in cold water instead of hot, (2) by well rinsing them free from soap, (3) by rubbing in, just before drying the hands, a mixture of equal parts of glycerine and red lotion (composed of zinc sulphate two grains, tincture of lavender ten drops, and water an ounce), (4) by thorough drying, making use if necessary of a drying powder, e.g., violet powder, sanitary rose powder, or common starch or flour. When chaps have occurred the glycerine and red lotion mixture or hazeline cream should be rubbed in at bed-time, and clean woollen gloves worn all night. The use of oatmeal water instead of soap and water is also desirable. The best towels to use are washed at home without chemicals, and are mangled but not ironed.

In youth the skin of the face and back is often the seat of *black-heads.* These are due to the secretion of the oil glands being pent up. In these cases also the use of hot water and soft soap at night is useful. (Soft soap is prepared with potash instead of the soda of ordinary soap.) The *clothing* worn next the skin is a matter the importance of which is often forgotten. Many skins cannot stand rough flannel next them. This intolerance is due partly to the mechanical irritation of the rough flannel and partly to the perspiration often induced. The result is troublesome itching and the appearance of a rash. In such cases if soft cotton or silk material be substituted and flannel worn over it good results are obtained. The skin must be kept dry; urine and sweat are both highly irritating if allowed to remain in contact with the skin, especially in parts exposed to friction. In hot weather the underclothing requires more frequent changing, and in infancy the diapers should be changed directly they are soiled and the skin cleansed with oatmeal water.

2. HEALTH OF THE SKIN. A healthy skin covers a healthy body. The state of the *general health* has an important influence on the welfare of the skin. All are familiar with the "staring coat" of a horse that is out of sorts. In man gouty eczema, and the rashes of the infectious fevers are examples of the effect of the general health on the skin. It is the digestion, however, which is specially important. Those who desire a *good complexion* and sufferers from nettle-rash or "breakings out" should attend to the bowels and restrict the diet to easily digestible food; fatty and sweet food are specially harmful.

The skin may be injured by *unfair wear and tear.* An ill-fitting boot is the cause of a corn; the use of cosmetics of a ruined complexion; the repeated exposure of the hands to strong chemicals, as in laundry and other trades, may cause eczema, and old people who sit much in front of the fire often have a similar eczema of the skin over the shins.

The skin is liable to a great number of *disorders.* This is due to its exposure to changes of temperature, injury, germs, and other parasites, and also to its complex structure.

Germs are responsible for boils, carbuncles, eczema and lupus: fungi for ringworm and scaldhead; animal parasites for itch, and pediculosis, which is due to lice. Disorder of the nervous system is the cause of nettle-rash, red gum rash, shingles, dead fingers, and the itching without apparent cause so common in the elderly. Disorder of the swea glands causes profuse sweating or serious deficiency, or an altered character of the sweat, retention of the sweat causes prickly heat. Disorder of the oil glands causes baldness, black heads, sebaceous cysts or wens, and often gives rise to eczema. Disorder of the blood-vessels causes birth-mark and purpura. Lastly, overgrowth of the epidermis may cause corns, warts or cancer.

SKULL, FRACTURED. See *Blows.*

SLEEP. A baby should sleep twenty hours out of the twenty-four; at fifteen years of age nine to ten hours suffice; at fifteen to twenty-five years eight hours, and after this age six to seven hours until old age is reached, when more is required. The amount of sleep required, however, varies greatly in the case of different individuals, as well as in that of the same individual at different ages. People should have their sleep right out as much as possible, but once fully awake it is well to rise at once. In order that sleep may be as refreshing as possible the surroundings must be suitable. The bedroom should be quiet, darkened, cool, and well ventilated. Ventilation is best effected by a window open at the top and by the chimney register being never closed. The bed should have a hair mattress, not feathers. The foot of the bed should have extra covering over it. The pillow should be low in childhood and higher as age advances. In childhood a sleep in the forenoon daily is most beneficial. Children should go to bed not later than seven o'clock, and they should have a good "romp" for half-an-hour or so before bed-time. Babies should sleep in cradles without rockers. To be rocked to sleep is an acquired habit that is quite unnecessary, if not harmful, as hospital experience has abundantly proved.

SLEEP, DISTURBED. See *Dreams, Sleep-walking.*

SLEEPLESSNESS may arise from many causes that may be summarised thus:—(1) Pain and other sources of irritation, e.g., indigestion, adenoids, itching, etc.; (2) poisons in the blood which irritate the brain; these may arise from the abuse of coffee, tobacco, opium, or other drug, or from some bodily disorder, e.g., gout, Bright's disease, etc.; (3) mental disturbance by worry, excitements, or strange surroundings, or by insanity. The treatment is largely a matter of the detection and removal of the cause, though certain aids to sleep may often be adopted with benefit. There are two chief varieties of sleeplessness, (*a*) difficulty in going to sleep at the beginning of the night's rest, (*b*) a habit of waking in the small hours, with difficulty in dropping off to sleep again. Sufferers from variety (*a*) should pay attention to the points referred to under *Sleep.* The hour of retiring should be the same each night. The mind and body should both be healthily tired, without being overfatigued. Hence those engaged in sedentary occupations often sleep better for a short evening walk each night. Study pursued till bedtime or an exciting novel may cause a sleepless night. Heavy suppers or strong coffee late at night promote insomnia. Fruit late at night is also said to be a cause. Soothing applications to the skin are often of great service, e.g., friction with a flesh brush or a warm bath. Warmth to the feet may be required in the form of extra covering or a hot bottle. The position of the head should be high in full-blooded people, in heart disease or asthma, and low in childhood and anæmia. Monotonous mental impressions promote sleep; thus thinking of a familiar rhyme over and over again, counting, reading a dull book, or, still better, having it read to one in a monotonous voice, picturing a flock of sheep coming through a gap in a wall one by one are familiar examples that have their use. The use of alcohol as a night cap before retiring to bed is a habit that cannot be recommended. Sufferers from variety of insomnia (*b*) who wake in the small hours should take a little food, preferably warmed, e.g., milk or beef tea. A spirit lamp or special burner in connection with the gas of the bedroom should be at hand for the purpose. Any tendency to flatulence or constipation should receive appropriate treatment. Drugs used to procure sleep are given under *Drugs;* they are only safe in medical hands.

SLEEPING SICKNESS, THE. This disease, known in West Africa for a century, has now made its appearance in the Congo Protectorate and Uganda. The sleep at first is often put down to laziness, but the face becomes dull and bloated. The victim lies sleeping in his tent, and can scarcely be roused to take food. By degrees he wastes to a skeleton, and within eight months dies. The cause of this disease has recently been discovered by Dr. Bruce, who has proved that it is due to an animal parasite called *Trypanosoma,* which is found as a parasite in the body of the tsetse fly, and transmitted by the fly to the man or animal it has bitten. The prevention and treatment are problems calling for solution.

SLEEP-WALKING, or **SOMNAMBULISM,** has been described as a dream that is acted. At times skilled muscular feats are accomplished, e.g., climbing over roofs, and more rarely skilled mental acts, e.g., solving a mathematical problem. The somnambulist on waking has no recollection of his acts. Sleep-walking generally occurs in high-strung school children who are over-worked at school. The treatment should be in medical hands, and meanwhile, the windows and doors must be guarded and the child not left to sleep in a room by itself.

SLING. See *First Aid.*

SLOUGH is a piece of dead tissue, and is, therefore, sooner or later separated from the body and thrown off.

SMALL-POX is due to a germ not yet discovered. Infection is spread both by contact with infected persons or clothing, and by the air. Few diseases spread their infection by means of the air with such success. Hence small-pox cannot be safely treated either at home or in the ordinary fever hospital; special hospitals far from town are required. The age most liable to attack in the unvaccinated is under ten years. In the vaccinated the attack, if it occurs at all, is after that age, with few exceptions; this is owing to the immunity conferred by successful vaccination lasting for ten years in most cases. The disease is most prevalent in the winter. [The incubation and quarantine period will be found in a table under *Fevers.*] One attack, with few exceptions, renders the subject immune to future attacks. The *symptoms* at the onset consist of shivering, vomiting, pain in the back, and a sudden rise of temperature to 103°. The patient feels ill for three days, when the true rash of small-pox appears in the form of red spots, shotty to the feel, situated most often at the margin of the hair and on the wrists. The appearance of the rash is commonly accompanied by a feeling of relief, and by a fall in the temperature. The spots subsequently undergo changes similar to those of vaccination pocks, and they leave more or less scarring, which may be very slight. The patient is free of infection when all the scabs are off, usually in three weeks from the onset. In the worst cases the rash is general, and the spots join each other, the fever is high, delirium and death common. Such cases form the "confluent form" of small-pox. By previous vaccination the symptoms are often much reduced. Hence a few shotty pimples appearing at the wrist or forehead, with or without a feeling of illness, vomiting or fever, should always arouse suspicion if small-pox is about. The disease is often confused with chicken-pox, measles, and influenza. The *treatment* should be strict isolation in all suspected cases till the doctor arrives, and the contents of the rooms last occupied should be left untouched with the doors locked. The Metropolitan Asylums' Board send suspected cases to the Wharf Hospital for observation, and only after the disease has declared itself are the cases sent to the small-pox hospital proper. The ambulances are disinfected before a new case is fetched. Those who desire a private hospital can obtain it at the South Mimms Small-pox Hospital, not far from Barnet. [Refer to *Vaccination.*]

SMELLING SALTS are prepared with ammonium carbonate or "lump ammonia," which is moistened with lavender water. Other scents are also added at times.

SMOKE NUISANCE. The fact that each house does not consume its own smoke is only too obvious. The effect of fogs laden with such smoke is disastrous to sufferers from consumption or bronchitis. It is much to be desired that some remedy for this danger to public health may be found.

SMOKING in moderation is harmless to the adult. It is used as a nerve sedative and as a stimulus to the bowels. The best time is after meals; as it diminishes hunger it should not be indulged in shortly before meals. Juvenile

smoking stunts growth. In excess, tobacco disturbs the action of the heart and may injure the sight. The inhalation of cigarette smoke is bad for the air passages. The use of very strong tobacco is proved to cause chronic sore throat and dulling of the sense of taste. Broken clay pipes used over a long period may determine the onset of cancer of the tongue or lip.

SNAKE BITE kills by paralysis of the nervous system. Much swelling may occur around the wound. A ligature should be firmly tied around the limb between the bite and the heart, and close to the former. The wound may be sucked, though with some risk, especially if the lips are cracked; the saliva must be spat out at once, and the mouth should then be well rinsed. The wound should then be bathed with dilute ammonia. The patient must be kept warm and given stimulants freely. The sooner a doctor can be procured the better, as the wound requires cauterizing. Calmette has succeeded in obtaining a curative serum known as anti-snake venom from the blood of animals rendered immune to snake venom. The serum retains its healing power for a year, and is of great service in India and elsewhere. In England the viper is the only poisonous snake, and its bite rarely kills. The faintness it often causes is frequently due not to poison but to fright.

SNEEZING occurs in hay-asthma and ordinary colds; it may be an early symptom of measles or influenza. The symptom may often be allayed by inhaling steam from a jug of boiling water, or from a pint of boiling water to which a teaspoonful of Friar's balsam has been added. The inhalation of creosote, eucalyptus, or camphor may also be tried, or Ferrier's snuff may prove effective. At times repeated sneezing is a symptom of stomach disorder; an emetic then gives prompt relief.

SNORING is due to breathing with the mouth open during sleep. In childhood it is often due to "adenoids." In later life snoring may be checked by lying on the side or by keeping the mouth closed with a bandage under the chin.

SOAP. See *Skin, Care of.*

SODA and its various compounds are very similar to potash, though not so readily absorbed into the circulation. Bicarbonate of soda, in half teaspoonful doses, in a little water, often relieves heart-burn; two ounces of washing soda to a footbath of hot water is useful in allaying the pain of gout in the foot; tartrate of soda, in the form of a Seidlitz powder, is a useful aperient.

SOIL. See *House.*

SOMNAMBULIST. See *Sleep-walking.*

SORE THROAT, QUINSY, TONSILLITIS, are terms in popular use to denote many forms of throat affection, which in Medicine are recognised as separate conditions. When the throat becomes sore it may be a symptom of the onset of some fever, which is most likely to be the case in childhood. Hence a child with a sore throat should be isolated in a bedroom at the top of the house. The throat should be examined in a good light in the way described under diphtheria, and if anything can be seen that makes one suspect that disease, no time must be lost in summoning the doctor. If the throat has been distinctly seen in a good light and no white patches are present on the tonsils or elsewhere, it will be less necessary to consult a doctor at once, but the appearance of a rash next day should be looked for on the chest, as scarlet fever has to be thought of, and the joints should be examined, as rheumatic fever may develop. Meanwhile, a light diet of milk and barley water, egg and milk, blancmange, jelly, and plenty of soothing drinks, e.g. linseed tea or imperial drink, should be allowed, and a mild aperient given at night. In adults, specially in domestic servants, with bad teeth or with a plate of false teeth worn over festering stumps, as is only too often done at the present day, sore throats are very common. These take the form of either *tonsillitis*, known as ulcerated throat, or of *quinsy*, that is an abscess in one tonsil. The tongue becomes coated, swallowing difficult, the temperature rises to 102° F., the limbs and head ache. The attack lasts about a week; if an abscess forms it may burst, but time and suffering is saved by having it lanced. The possibility of the attack being the onset of a fever has to be borne in mind. The same mode of isolation and dieting should be employed as that given above.

A chlorate of potash gargle, some port wine, and a quinine mixture should be employed; the false teeth should not be worn during the illness; the neck should be wrapped up in wool.

1. CHRONIC SORE THROAT may be due to overstrain of the voice, as in the "clergyman's sore-throat," or to indigestion, to the abuse of tobacco or alcohol, or to disease of the nose. The treatment should be the removal of the cause, aided by suitable applications to the throat.

The "gargle to cleanse the tonsils," mentioned under "gargle," should be used thrice daily, and the throat should be sprayed or preferably painted with a large camel's hair brush dipped in a solution of menthol, in paroleine, or olive oil, in the proportion of 1 to 7. If these give no relief after a week's treatment, the throat should be painted with glycerine of tannic acid, and an alum gargle should be used. The use of black currant jelly, liquorice, or a teaspoonful of glycerine, honey, or syrup of lemon will be found to ease the throat and improve the voice temporarily.

Clergyman's sore throat usually indicates the need for some lessons in elocution.

2. ELONGATED UVULA is a common complication of chronic sore throat. The enlarged uvula excites a constant tickling in the throat which may be very troublesome. The treatment should be that for chronic sore throat. If necessary, the uvula can be treated surgically, and with the aid of cocaine this can be done without much pain, and without chloroform being required.

To see one's own uvula all that need be done is to stand in front of the glass in a good light and say "Ah," when the uvula is seen as a fleshy projection hanging down from the edge of the palate in the mid-line. At the word "Ah" it is drawn up. When elongated it hangs low enough to come in contact with the back of the tongue, and it rises imperfectly at the word "Ah."

SOUP. See *Food.*

SPANISH FLY. See *Cantharides.*

SPASM is an involuntary contraction of a muscle due to some abnormal cause. The possible causes are numerous. The spasm itself is usually painful, and may cause serious results; thus spasm of the muscles around the top of the windpipe causes suffocation by closure of the windpipe. Spasm of the bronchi causes the symptoms of an attack of asthma, and so on. Spasms may be either continuous, as in lock-jaw, or of short duration, but frequently repeated, as in an epileptic fit. Spasm of the muscles of the abdominal viscera is known as colic. Hot applications help to relieve spasm; and the drugs, which also act in this way, known as antispasmodics, are given under the heading *Drugs.*

SPECTACLES. See *Sight, Squint.*

SPEECH is effected by a complex mechanism. Vowel sounds are produced in the larynx, or voice-box, situated at the top of the wind-pipe; consonants are produced by the modification of these primitive vowel sounds by the lips, tongue, and palate. The nerve centre in the brain concerned with the production of the necessary movements is situated on the left side only. It is intimately connected with the brain centre of hearing, of sight, and of writing. If any part of the above mechanism is out of gear, speech is imperfect. The most common injury to the brain which disturbs the speech in adult life is an apoplectic stroke down the right side of the body. Such a stroke is due to the rupture of a blood-vessel on the left side of the brain, which damages the speech centre. The speech is also affected in general paralysis of the insane, in idiocy, and a few other diseases of the nervous system. Temporarily it is often much disturbed in St. Vitus's Dance, and during alcoholic intoxication. Speech is not abolished by removal of the tongue.

1. LEARNING TO SPEAK. Speech is acquired, as a rule, towards the end of the second year of life, but at times it is delayed until the end of the fourth year. Speech is learnt by hearing a language spoken and by learning to associate objects and actions with words. A child born stone deaf or one who becomes so early in life, is thus necessarily dumb. Such children can be taught to speak by the aid of the eye instead of the ear, as in the now well-

known "lip reading" method adopted in schools devoted to the subject. A child picks up readily the dialect of those amongst whom it lives, hence care in the choice of a nursemaid is of great importance. When first beginning to talk a child talks "baby talk." Many well-intending parents make the mistake of talking to children in this same "baby talk," as though they could not understand plain English. It is a great mistake, for the "baby talk" is simply the first defective attempt to talk good English. Surely to help the child to talk, the worst thing possible is to talk to it in its own imperfect language; every error is thus encouraged and the task made greater.

2. LISPING. Defective speech in the form of a lisp not uncommonly persists to adult life, and is from some strange whim regarded as good style by some people. A lisp is the rule in "baby talk"; *f* is substituted for the *th* sound, and *w* for *r*, because these are easier sounds to produce. In rarer cases this substitution of easy consonants for difficult ones is carried to such a pass, that the child appears to be talking a foreign language. Thus Dr. Colman describes a case of his in "Allbutt's System of Medicine," in which the Lord's Prayer was repeated thus: "Ouë Tahde na ah in edde, anno de Di na, I tidde tah," etc. In this case *t*, *d*, or *n* were substituted for those consonants that the child found difficult. In cases of this condition, and in ordinary lisping, there may be defects in the air passages, e.g. tongue-tie, high or cleft palate, enlarged tonsils or adenoids, etc. Such defects should be detected and removed, and the child then made to talk properly by firmness and patience.

3. STAMMERING, or stuttering, is another speech defect commonly met with. In this condition there is an occasional difficulty to produce certain sounds in the course of conversation, though scarcely ever in the course of singing. The condition occurs in nervous children; it begins in childhood, and usually passes off with advancing years. The efforts to produce the desired sound are often so great that the sufferer looks on the verge of a fit. Ridicule makes matters much worse. The stutterer should speak slowly, and when about to stammer he should raise his voice and concentrate his effort on the vowel portion of the consonant; thus in *b*, really *be*, he must say *e* and let the *b* go. Perseverance is essential.

SPHINCTER is a muscle in the form of a ring. When the muscle is contracted the ring is closed; when relaxed it is open. Sphincters guard the outlet from the bladder, intestine, and elsewhere.

SPIDER'S WEB is a bad application for cuts on account of the dirt it contains.

SPINA BIFIDA is a condition in which the lower end of the spine fails to develop properly before birth. A tumour is then present at birth, composed of the distended spinal marrow and its sheath, which bulge through the gap in the spine. Death nearly always occurs within a few weeks.

SPINACH is the most digestible of the green stuffs, See *Food*.

SPINE, backbone, spinal or vertebral column, consists of a series of separate bones or vertebræ, which are jointed into one another, and are also united by pads of gristle placed between each of them, and by powerful muscles and ligaments. Each vertebra is ring-shaped. Hence the vertebral column as a whole contains a cavity, the spinal canal. This canal is connected to the cavity of the skull by means of an aperture in the latter termed the *foramen magnum*. It contains the spinal cord.

SPINAL CORD is part of the central nervous system. It is really a continuation of the brain downwards. It extends from the upper end of the spine to the middle of the loins. It lies within the spinal canal, enclosed in a protecting sheath of membrane. Between each of the vertebræ it gives off a pair of spinal nerves that leave the spine and supply the various parts of the trunk and limbs. The nerve centres, which control the bladder and anus, are situated at its lower end, hence pressure on the cord above this level will cause paralysis of these organs, in addition to that of the legs. Of the diseases to which the spinal cord is liable, *Locomotor Ataxy* is the chief [which see].

SPINAL CURVATURE. The spine is normally curved from before backwards, but not from side to side. The spine should be curved forwards in the neck, backwards in the back, forwards in the loins, and backwards below this level. To these normal curves the term spinal curvature does not apply. The most common abnormal curvature is one from side to side, *lateral curvature*. The first symptoms of this deformity, which is common in school girls, are the growing out of the right shoulder and hip. If neglected the condition increases and becomes permanent after the age of eighteen, when the active growth of the spine ceases. The affection is wholly preventable with few exceptions. It is caused by the habitual assumption of faulty attitudes. Growing girls with weak muscular development are easily tired if made to sit on a stool or to stand for any length of time. Hence they seek relief by change of posture, and assume attitudes which deflect the spine from the upright. Such postures, when adopted habitually, produce permanent changes in the spine. School girls should always be provided with chairs with backs, and they should so sit on them that the whole back, not only the shoulders, is rested against them. Gymnastics should be encouraged, especially swinging from a horizontal bar. Writing should be performed with the shoulders square with the desk. Standing should be of short duration only, and all lolling with one knee bent should be prohibited. No mechanical supports for the spine should be employed. When lateral curvature has developed the doctor should always be consulted, as it may be due to one leg being shorter than the other, or to one eye being stronger than the other, and these errors may need correction, although most cases are due to neglect of those matters of school-room management mentioned above.

Two other forms of spinal curvature deserve mention:—(1) The *hollow back*, which is due to an exaggeration of the normal curves. This should be treated by gymnastics and attention to the general health. (2) The *round back*, which is due, like lateral curvature, to a faulty attitude. Usually stooping over a book or other work is the cause. Such stooping may be the result of short sight, and may thus demand suitable spectacles, or it may be due to a softened state of the bones, the result of rickets.

SPINAL DISEASE is the cause of the common deformity known as hunch back. It is also known as *angular curvature*. It is due to the bones of the spine being attacked by the tubercle bacillus; in other words, it is consumption of the back bone. This is a most serious disease, which demands prompt and prolonged treatment. So long as active mischief is going on in the spine, so long must the sufferer be kept lying down, for the spine will not heal unless completely rested. Do not be surprised, therefore, if your doctor orders the patient to be kept lying down for a couple of years. Children soon grow accustomed to this position, and are quite happy, especially when they see what relief from pain it gives them. Spinal jackets of plaster of Paris or poro-plastic are a poor substitute for the complete rest obtained by lying down. A portable box, known as Phelp's box, is used for young children, which can be carried about so that the child may be brought down into the garden. The symptoms of onset of spinal disease are as follows:—(1) The child no longer cares to play as it did, but mopes about by itself; (2) it comes downstairs with great care; (3) it is constantly supporting its head with its hands, with its elbows on the table. These symptoms are due to the fact that any sudden jar to the spine causes pain. (4) Pain is often felt along the course of the spinal nerves. Thus pain may be referred to the stomach or limbs, and mistakes may thus arise; stomach ache, or "growing pains," may indicate disease of the spine. Such symptoms demand prompt medical aid. If neglected, hunch back or cold abscess may develop, and the tuberculous disease may spread to other parts of the body and prove fatal.

SPIRITS, LOW, usually result from constipation [which see].

SPITTING BLOOD, though it always arouses suspicion of consumption, may be due to less serious causes. Hence the symptom need not cause unnecessary alarm, though it

should be reported promptly to the family doctor. [For treatment see *First Aid*].

SPLEEN, or MILT, is an abdominal organ, the function of which is to manufacture new blood and to remove the old blood. In malaria it is liable to undergo great enlargement, forming the so-called *ague-cake.*

SPLINT. See *First Aid.*

SPORADIC cases of disease are those which occur here and there from time to time, a term thus the opposite of epidemic, which denotes a large number of cases occurring at the same time close together.

SPOTTED FEVER, or Epidemic Cerebro-Spinal Meningitis, is a disease of young persons, usually in isolated cases, but at times in epidemics. The germ is found in the discharge from the nose of patients suffering from the disease, and soiled handkerchiefs are thus a possible source of infection. Horses, which suffer from a similar fever, may possibly be sometimes the cause of the epidemic. A patient with spotted fever very rarely, if ever, infects other patients in the same ward. The *symptoms* resemble those of influenza at the onset, passing on rapidly to delirium, deafness, and painful spasm of the muscles of the back, which cause the head to be drawn backwards. The skin becomes tender and haemorrhage occurring here and there beneath it produces the purple spots which give the disease its name. *Post mortem*, the membranes lining the brain and spinal cord are found acutely inflamed and contain the germ.

SPRAIN. See *First Aid.*

SPRAY. Applications may be made to the throat in the form of a spray, but they have the drawback of always feeling cold, even when the fluid used is nearly boiling. An ether or ethyl chloride spray is most useful for freezing the skin before performing some minor operation, e.g. opening an abscess. The pain is thus almost abolished, though some pain is felt afterwards when the skin thaws.

SQUILL is a drug used to aid cough in the later stages of bronchitis. It should never be given until the cough loosens.

SQUINT is present when both eyes do not look at the same point. The effect produced is "seeing double." When, however, the squint develops early in life, the patient learns to look with one eye only, ignoring the squinting eye so that by becoming blind in this eye he does not see double. In early life the development of the slightest squint indicates the need of suitable spectacles, which will cure the squint without the aid of an operation. If a slight squint is ignored, it will get worse, and a condition becomes established which only an operation can remedy. In later life the development of a squint is usually due to paralysis of one of the muscles that move the eye. This may be only temporary, as in alcoholic intoxication, or more permanent, as in tumour on the brain. Suitable medicine may relieve the condition, and, meanwhile, a shade must be worn over one eye, or a suitable prism eye-glass worn to prevent "seeing double." [Refer to *Eye.*]

STAMMERING. See *Speech.*

STARCH. See *Digestion, Dusting Powder, Food.*

STARVATION, or the absence of food, usually proves fatal within twenty days if plenty of water is obtained. Absence of water kills within a very few days. The cause of death in starvation is usually a gradually deepening stupor, due mainly to a steady fall in the temperature of the body. The *treatment* should be warmth, stimulants, and small quantities of easily digested nourishment. Predigested food, e.g. peptonised foods or somatose are specially suitable. A large meal after a prolonged fast may prove fatal. [Refer to *Food, Fasting.*]

STEEL WINE. See *Iron.*

STETHOSCOPE is an instrument used to listen to the sounds of the heart and the lungs. The one now used consists of two tubes, one for each ear, uniting below into a single tube, which is applied to the chest.

STIFF NECK is commonly due to a chill, but it may be a symptom of spinal disease. Ordinary stiff neck should be treated by rubbing in stimulating liniments, such as compound camphor liniment, and by wrapping up the neck in wool or flannel. If spinal disease is present, light pressure applied to the top of the head when the patient is standing or sitting up causes pain in the neck. In ordinary stiff neck this is not so. [Refer to *Wry Neck.*]

STIMULANTS are remedies which promote the activity of any organ. Those which act on the heart and the nervous system are the most important. They include warmth, hot food, tea, coffee, alcohol, strychnine, ammonia, sal volatile, etc. [Refer to *Alcohol, Drugs.*]

STINGS. See *Bites.*

STITCH is a sharp pain in the side. A stitch of only short duration may be caused by running, specially soon after a meal. It may be prevented by training, and requires no treatment. Persistent stitch, made worse by taking a breath, may be due to pleurisy or pneumonia [which see].

STOMACH is situated in the upper part of the abdomen on the left side, partially protected by the ribs. It is lined by a mucous membrane, which secretes a digestive juice, the gastric juice, and slime, or as it is technically called, mucus. The secretion of gastric juice is under the influence of the nervous system, and is stimulated by the presence of food in the stomach. Hence indigestion may arise from disturbance of the nervous system, or from the unsuitable nature of the food eaten. Indigestion, especially if due to the abuse of alcohol or tea, is prone to lead to chronic inflammation, or as it is termed, *chronic gastritis,* in which much mucus and but little gastric juice is produced, and the food not being digested turns sour. Gastritis requires rest; the diet must be altered. Diluted milk in small quantities at a time should be taken; a glass of hot water should be taken before meals, and two to four of the bismuth lozenges of the Pharmacopœia should be taken after each meal. If neglected, gastritis may lead on to *ulcer* of the stomach. An ulcer is a wound in the stomach, and is, necessarily, difficult to heal, owing to its being constantly irritated by the gastric juice and by food. It causes most severe pain in the pit of the stomach in front or near the angle of the shoulder blade at the back. This pain is usually felt twenty minutes after food. Vomiting blood, if it occurs, is proof of the presence of an ulcer. It is most common in domestic servants. The treatment should be in medical hands. The stomach may become dilated, either as the result of chronic gastritis, or from constriction of the pylorus, that is its point of outlet into the intestine. A dilated stomach may retain food for several days, and then it may empty itself by vomiting several quarts of fermenting food. This condition is treated by washing out the stomach daily, a procedure not nearly so unpleasant as it sounds. The stomach is liable to *cancer.* This occurs chiefly in the middle-aged. It causes symptoms very similar to those of chronic indigestion or of dilated stomach. Much may be done to give relief in such cases. [Refer to *Abdomen, Digestion, Indigestion, Gastric Juice, Drugs.*]

STONE. See *Bladder, Gall Stone, Kidney.*

STOOLS. See *Motions.*

STOUTNESS. See *Obesity.*

STRANGULATION is due, partly, to the suffocation induced by pressure on the wind-pipe, and partly to the interference with the circulation through the brain, due to pressure on the blood vessels of the neck. The constricting cord should be removed, and artificial respiration, warmth, and stimulants at once employed. [See *First Aid.*]

STRANGULATED HERNIA. See *Rupture.*

STRAPPING. See *Plaster.*

STRICTURE is a contraction of any natural passage or orifice. Thus we may have stricture of the gullet due to cancer, or to the pressure of an aneurism, or stricture of the pylorus, which is the passage from the stomach to the intestine, and so on. A stricture is usually caused by ulceration or cancer.

STROKE. See *Apoplexy, Sunstroke.*

STRYCHNINE is the active ingredient in nux vomica. It is a powerful drug, much used as a nerve tonic, but of course only by medical prescription, as it is highly poisonous except in minute doses. [Refer to *Poisons.*]

STUPOR. See *Coma.*

STUTTERING. See *Speech.*

STYE is a miniature abscess round the root of an eyelash. It should be bathed with hot water till it bursts, and the general health should be toned up.

STYPTICS are remedies which arrest bleeding. See *First Aid.*

SUCKLING. See *Infant Feeding.*

SUDDEN DEATH may be due to fatty degeneration of the heart, disease of the valves at the root of the aorta, or to rupture of the heart; to a clot becoming dislodged and obstructing some vital part of the circulation; to the rupture of a blood vessel in the brain, lungs, or abdomen; to rupture of the bladder or other abdominal viscus; to shock due either to great mental emotion, to severe pain, or to the sudden application of cold to the stomach, as in eating a large quantity of ice cream, or drinking copiously of iced water on a hot day; to food or other material becoming lodged in the wind-pipe; to spasm of the vocal cords, as in croup. Sudden death is very rare during an epileptic fit, an attack of asthma, a fainting fit, or the various forms of heart disease not mentioned above.

SUDORIFICS are remedies to promote sweating. The term diaphoretics is more often used, which see.

SUFFOCATION is obstruction to respiration caused by any means except the application of pressure to the neck. When the latter mode of obstruction occurs, the term "strangulation" is used. Suffocation is a common cause of death amongst the infants of the poor, owing to the practice of parents and infant sharing the same bed. This is illegal in Germany. The effect of the practice is to expose the infant to being suffocated by the parents, who, turning in their sleep, may lie on their child. Many of these cases are deliberate murder. [For treatment see *First Aid.*]

SUGAR. See *Food.*

SUICIDE. It has been said with no little truth that no man ever committed suicide directly after a full meal, a sound night's sleep, or a free action of the bowels. In the treatment of the would-be-suicide these three points should receive special attention.

SULPHATE OF SODA. See *Glauber's Salts.*

SULPHUR, or brimstone, taken internally is a mild laxative, the dose of flowers of sulphur being twenty to sixty grains; of confection of sulphur one to two teaspoonfuls; and of sulphur lozenges, one to six. In the form of sulphur ointment it is a useful remedy for ringworm, scabies, and other parasitic affections of the skin, though it is wise to dilute it with an equal quantity of zinc ointment, well mixed with it, as sulphur is very irritating to some skins.

SUNSTROKE exists in two forms: (1) Heat Exhaustion, (2) Thermic Fever. HEAT EXHAUSTION may result from exposure to heat of any kind. The symptoms are collapse, pallor, sweating, rapid feeble pulse, hurried breathing, and subnormal temperature. Death may occur from heart failure, though complete recovery is the rule. The *treatment* should be plenty of fresh air and stimulants. THERMIC FEVER rarely occurs except from exposure to the direct rays of the sun. Fatigue, tight clothing, and alcohol increase the tendency to it. The symptoms are loss of consciousness, which may become very deep. This loss of consciousness may be the first symptom, the victim falling as though struck down, but usually dizziness and nausea occur for a short time previously; the face is flushed, just the opposite to the pallor of heat exhaustion; the temperature rises and may reach 110° F. The case may soon terminate in death, or recovery may occur, the onset of which is indicated by a return of consciousness and a fall of the temperature. The after effects may include impairment of memory and intolerance of even the ordinary summer heat. The *treatment* should be the loosening of all tight clothing and the application of cold to the whole body. This may be applied by sponging every few minutes with well water, or better by the application of ice. A sponge bag full of ice should be secured to the head.

SUPPOSITORY is a cone-shaped solid preparation containing food or drugs for introduction into the lower bowel. They are usually prepared of cacao butter, beeswax, or gelatine, in order that they may melt at the temperature of the body. As a rule their action is less certain than that of enemata.

SUPPURATION, or the formation of matter, occurs when a pimple comes to a head, or when an abscess forms. [See *Abscess, Inflammation.*]

SUPRARENAL BODIES are two small glands, one of which rests on the upper end of each kidney, hence their name. When diseased, Addison's disease results, the chief feature of which is great debility, both of the muscular and the circulatory systems. The function of the suprarenals was not demonstrated till 1895, when Schafer and Oliver obtained an extract from them which they proved had the power of stimulating muscular action, especially the muscular coat of the blood-vessels. This fact, coupled with the symptoms of Addison's disease, point to their function being the secretion of a material, which they add to the blood passing through them, and which improves the tone of all the muscles in the body. The extract known as "suprarenal extract," or *adrenalin*, is now widely used by the medical profession to check hæmorrhage, for when applied to a bleeding surface it closes the mouths of the cut vessels, by stimulating their muscular coats to contract.

SURGEON. See *Doctor.*

SUSPENDED ANIMATION. See *Drowning* in the article on *First Aid.*

SUTURE is a stitch. Horse hair, catgut, silkworm gut, silk, and silver wire are used in surgery. In anatomy the term denotes the line of junction of two bones of the skull.

SWALLOWING is an act effected by the muscular action of the throat and gullet. The food does not fall down into the stomach, it is forced down. Hence an animal grazing is able to swallow without raising the head. Difficulty in swallowing may be due to hysteria, to stricture of the gullet from cancer, or to pressure on it by aneurism or other tumour within the chest.

SWEAT is always being poured out from the pores of the skin. As a rule, it dries as fast as it appears, and so we are unconscious of it. Perspiration of this kind has been called "insensible perspiration," as opposed to "sensible perspiration," or sweating that is sufficient to be visible. Normally, perspiration is only sufficient to be visible when the body is heated. The sweat in drying chills the body and thus checks the rise of temperature that would otherwise occur. Sweat is composed mainly of water, but it contains some waste products and fatty matter that readily turn sour. When the kidneys are out of order or overworked, the waste products are discharged in the sweat to an increased extent. Absence of the sweat glands is met with in some people from birth. Such people find a hot room unbearable, and are unfit for life in the tropics. Wide variations occur in different individuals, compatible with health, in the amount of sweat discharged under similar conditions; but in diabetes and many fevers the amount is insufficient. More common is EXCESSIVE PERSPIRATION. We are all liable to break into a cold sweat under the influence of strong emotion, but cases are common in which abnormal sweating of the hands, feet, and other parts of the body occur. Such cases range in severity from a clammy, moist hand to conditions in which the sweat pours off, making the skin sodden, and rendering work of various kinds almost impossible. Added to this annoyance is the difficulty of preventing the sweat turning sour and becoming offensive. The *treatment* should be strict attention to cleanliness, the use inside the socks of a dusting powder, e.g., boric acid or borax, or these mixed with zinc oxide, and improvement of the general health. As a rule the fingers are bluish and cold, which points to a sluggish circulation. In such cases fresh air, food, exercise, tonics, and cold baths should be tried. In others the nerves are overwrought, and a holiday with more sleep is requisite. Special medicines for checking sweating are available, but of these the only one for domestic use is a

level teaspoonful of sulphur in milk twice a day. If this purges too much, it must be taken less often. It is often very effective. In stout people sweating at the folds of the armpit is often troublesome. This may be checked for some hours by applying a sponge wrung out of very hot water for some minutes and afterwards bathing the part with eau de Cologne. In rickets and consumption sweating is common during sleep. [Refer to *Rickets, Consumption, Drugs, Skin.*]

SWEETBREAD. The neck sweetbread of the butcher is the thymus gland. The belly sweetbread is the pancreas, a digestive gland that pours its secretion, the pancreatic juice, into the small intestine. Pancreas of the sheep or calf is well suited to invalid dietary.

SWEETMEAT. See *Confectionery.*

SWELLING may be due to dropsy, to inflammation, or to a growth.

SWISS MILK. See *Infant Feeding.*

SWOON. See *Fainting.*

SYNCOPE. See *Fainting.*

SYNOVIAL FLUID is the lubricating fluid poured into the interior of joints by the synovial membrane, which lines them.

SYNOVITIS is inflammation of the membrane lining a joint. The disease may be acute or chronic, and due to one of many causes, injury being the most common. The knee is the joint most often affected. The inflamed joint requires rest.

SYRINGE. See *Ear.*

SYRUP is a saturated solution of sugar in water. Hence in cold weather the sugar is apt to crystallise out, and in the hot weather to ferment. Syrups keep best when made from refined sugar, and kept in an even temperature in well-stoppered bottles. The Pharmacopœia contains twenty-two syrups made by adding different drugs to the simple syrup just mentioned. They are specially useful for administration to children.

> The syrup of the iodide of iron or of the phosphate of iron and Easton's syrup are useful tonics; syrup of orange, of ginger, of lemon and of Virginian prune are used as flavouring agents; syrup of glucose is used for pill making; syrup of red poppies and syrup of roses are used for colouring medicine a pleasant red; syrup of squills and syrup of tolu are used to loosen a hard dry cough; syrup of rhubarb and of senna are aperients. The dose of the above syrups is one teaspoonful for an adult.

Golden syrup is a useful article of nursery diet. Quack medicines sold as soothing syrups to quieten the baby are to be avoided; some of them contain opium, and are responsible, according to high authorities, for many deaths annually. [See *Opium.*]

TABES, literally, a consumption—is a term used to denote one of two diseases, viz., tabes dorsalis, or locomotor ataxy; and tabes mesenterica, or consumption of the bowels. [See *Locomotor Ataxy, Tuberculosis*].

TAMARIND WATER is a refreshing beverage that may be given in any case of fever. It may be prepared thus:—

> Two ounces of dried tamarinds are obtained from the grocer and are boiled in three pints of water for an hour; the mixture is then strained and served when quite cold.

TANNIN, or tannic acid, is an organic acid that is widely distributed in the vegetable kingdom. It has the power of coagulating albumin. Oak-bark owes its value to the tanner for the tannin it contains. The Pharmacopœia contains oak-galls, logwood, kino, catechu amongst others which owe their value to the presence of tannin. Tannin is an astringent; by coagulating the albumin with which it comes in contact, it checks bleeding and diarrhœa. Clean linen rags dipped in a strong solution of tannin freshly prepared may be applied to abrasions to check hæmorrhage. Its internal administration is best in medical hands, as there are many other drugs that check diarrhœa which upset the stomach less. Tea which has been infused for longer than three minutes beomes rich in tannin and is a frequent cause of indigestion. This risk may be avoided by pouring the tea into an empty teapot at the end of three minutes; the tea may then stand under a cosy for any length of time without harm. Tea is not a wise beverage to take with a meat meal, as any tannin present turns the meat eaten to a leather-like substance. Tannic acid glycerine and tannic acid lozenges are useful for relaxed throats. Port wine is used as a gargle for the same reason, as all red wines contain tannin. Hence white wine is better than red in dyspeptic conditions or if there is a tendency to constipation. Tannin is an antidote to many poisons. [See *Poisons*].

TAPE-WORM. See *Worms.*

TAR is now rarely used internally, but as an ingredient in various ointments it is valuable for all chronic and scaly conditions of the skin. The tar ointment of the Pharmacopœia is rather hard and strong and may be diluted to advantage with almond oil in equal parts. Still more useful is the preparation known as *Liquor picis carbonis,* or Solution of Coal Tar, in the proportion of half a drachm to an ounce of vaseline. A proprietary preparation known as *Liquor carbonis detergens* has a very similar action. From coal tar *creolin,* another proprietary preparation, has been prepared, and is now sold by the original makers under the name *Cyllin.* This body is an antiseptic, but its chief value is its use in baths or lotions for allaying itching. For a bath, half a teaspoonful to ten gallons should be used. For a lotion, a teaspoonful to a pint may be used.

TARTAR forms on the teeth a rough surface to which the germs of decay readily adhere. Hence the tooth-brush should be in regular use. [See *Teeth, Care of.*]

TARTAR EMETIC is a tartrate of antimony. It is contained in antimony wine. [See *Antimony.*]

TARTARIC ACID. See *Potash* and *Soda.*

TASTE is due partly to the tongue, partly to the nose. Hence a cold in the nose deprives us of much of our sense of taste, though the perception of sweet, acid, salt and bitter remains, for these are due to the tongue alone. Holding the nose is thus useful when taking nauseous medicine; and a pinch of salt or slice of lemon on the tongue just before the dose is taken may disguise the taste also. The palate does not play as large a part in taste as is commonly thought. A body must be in solution to be tasted, hence the use of pills and powders. A bad taste in the mouth between meals is usually due to constipation and indigestion. Loss of taste may be induced by heavy smoking.

TEA is a useful stimulant, which is due partly to the hot water and partly to the caffeine it contains. Tea infused longer than three minutes takes up tannin, which causes indigestion. Tea should, therefore, be poured off the leaves into an empty teapot if it has to be kept warm for any length of time. *Plasmon-tea* is an attempt to remove the tannin by the addition of plasmon, a preparation of milk. The use of milk with tea must act in much the same way and is desirable, though not essential, if the tea is properly made and poured out at once. For migraine, hot strong tea without sugar, slowly sipped, is a useful remedy.

TEARS are secreted by a gland situated on the outer side of the eye. The tears are smeared over the surface of the eye by the eye-lids, and the eye is thus cleansed. The tears then escape through two pores in the eye-lids at the inner corner of the eye, and pass down the lachrymal duct into the nose. If the duct is blocked tears overflow continually, a condition the surgeon can remedy.

TEETH are made of a bony material, the *dentine,* and covered by a modified skin which has been so impregnated with lime salts as to form a protective shell of extreme hardness known as *enamel.* The teeth receive nerves and blood-vessels, which break up into minute branches in a cavity in the centre of the tooth, called the pulp cavity, corresponding to the marrow cavity of other bones. The pulp cavity is highly sensitive, whilst the other parts of the tooth are not; hence has arisen the popular custom of calling the pulp cavity the nerve of the tooth. The roots of a tooth are the fangs; the part of the tooth above the gum is the crown; the junction of these is the neck of the tooth.

The *first set,* or milk teeth, consist of twenty. In health the first teeth cut are the central lower front ones; these are cut at the sixth month. At twelve months there should

be twelve teeth, at twenty months twenty teeth. The child is ready for farinaceous food when the teeth begin to be cut, and is ready for meat when the double teeth are cut, about the eighteenth month. The *second set*, or permanent teeth, have three large double teeth or molars, in each half jaw in addition to those that replace the twenty milk teeth. Hence there are thirty-two permanent teeth. They begin to be cut at the sixth year. The first to appear is the first molar or large double tooth. This does not displace a milk tooth but comes up behind it. It generally begins to decay very soon, and is often neglected because it is mistaken for a first tooth, no first tooth having been shed when it appeared. The last teeth cut are the third molars or wisdom teeth, usually at the twenty-fifth year, but often they fail to cut the gum either entirely or partially.

TEETH, CARE OF. The permanent teeth develop at the roots of the first set during the first year of life, before the first set have cut the gum. The health of the infant at this time has an important effect on the subsequent welfare of the teeth. Later in life, also, attention to the general health tends to preserve the teeth; whilst the care of the teeth will amply be repaid by their effect on the general health. The mouth and teeth must be kept clean. They should be cleaned at night as well as in the morning by the thorough use of a tooth-brush with some tooth powder. The tooth powder should be antiseptic and not too hard; Calvert's Carbolic tooth powder is a good example. Soap and water and salt and water are also recommended; precipitated chalk is good, but camphorated chalk and other preparations of camphor are bad, because they whiten the teeth at the expense of making the enamel crack. All acid mouth washes are bad; and all medicines that damage the teeth, like iron, should be taken in pill form or through a quill. Tooth picks should be of quill or wood, not metal. During suckling, phosphates should be taken as medicine to make up for those lost in the milk, otherwise the teeth suffer for want of this ingredient. The dentist should examine the mouth periodically and stop all teeth that require attention. Plates of artificial teeth should not be worn over stumps. The above remarks apply just as much to the first set as the second set. The child should be taught to use a tooth brush, and periodical visits to the dentist should be begun long before the second teeth appear. By this means much of the toothache, indigestion and tuberculous glands in the neck, so common in childhood—can be prevented, and the maximum growth secured. [See *Toothache*].

TEMPERATURE of the skin in different parts of the body varies widely, but the temperature of the deeper organs remains remarkably constant. This constancy is maintained by the nervous system which regulates the process of heat formation and of heat loss. A rise of temperature is generally due to less heat being lost and not, as one would expect, to an increase in the amount of heat produced. A reduction both in the quantity of blood supplied to the skin and in the amount of perspiration, check the loss of heat and thus cause a rise of temperature. The normal temperature of the mouth or armpit is, on the average, 98·6° F. In the rectum it is half a degree higher. There is a daily variation of temperature; it is lowest in the early morning, highest in the evening; it ranges between 97·5° F. and 99·5° F. These variations of temperature are often mistaken for signs of illness. In illness the daily variation is usually greater, and is present even in high fever. Illness more often sends the temperature up than down. In nervous people and children, trifling causes, e.g., gastric disturbance or emotion, send it up much more readily than in the average man. Inflammation causes a rise of temperature unless it is so intense that the patient is prostrated, when death may occur with a temperature that is at or below normal. The infectious fevers, with rare exceptions, cause a rise of temperature; diphtheria is unaccompanied by a rise of temperature more often than any other infectious disease. A temperature above 105° or below 96° is dangerous to life and requires active eatment. [See *Baths, Collapse*].

To take the temperature requires care. A clinical thermometer is required; the mercury must be shaken down till it is well below 98° F. before the temperature is taken. The thermometer should be left in position rather longer than the time it is supposed to require; a quarter minute thermometer should be left half a minute, and a three minute one five minutes. If the temperature is taken in the armpit, the skin must first be dried, and after the thermometer has been placed under the arm, the elbow should be drawn well across the chest and kept there. If the temperature is taken in the mouth, the thermometer must be placed *under* the tongue and be held by the lips, so that no air can pass to and fro through the mouth. In children it is unwise to take the temperature in the mouth; the groin is with them the most convenient, the thigh being bent well up on to the abdomen. The most accurate results are obtained in the rectum, and in most sanatoria for consumptives the temperature is taken in this way. After the temperature has been taken it should be written down at once and the thermometer should then be washed in *cold* water and placed in a disinfectant for a few minutes. Malingerers rub the thermometer between the blankets or expose it to the fire; boys in boarding-schools and hysterical women also are apt to do this if not watched.

TENDER FEET. See *Feet, Care of.*

TENDON, or leader, is the string by which a muscle is connected to the bone, on which it pulls. Thus the muscles of the forearm move the fingers by reason of their attachment by tendons to the bones of the fingers. Most tendons are surrounded by synovial sheaths that secrete a lubricating fluid; rupture of a tendon in the leg is the cause of *Cricketer's leg.*

TERTIAN FEVER is a form of ague.

TETANUS is *Lock-Jaw* [which see].

THERAPEUTICS is the science which treats of the use of drugs in the cure of diseases. *Pharmacology*, on the other hand, is the science which treats of the action of drugs on the various organs of the body when administered during health.

THERMOMETER. See *Temperature.*

THIRST occurs whenever much fluid is lost from the system, hence profuse sweating, vomiting, diarrhœa, hæmorrhage, and frequent passage of water, as in diabetes, all cause thirst. In febrile conditions water is always craved for and should be freely given. In indigestion a dry mouth with thirst is common. Relief is best given by gargling, sipping hot water, or sucking a slice of lemon, as copious drafts of fluid will make the symptoms worse. When fluid cannot be given by the mouth or when it is at once vomited, thirst is relieved by an enema of a pint of water containing a teaspoonful of salt, which should be given twice daily at blood heat.

THORAX is the *Chest* [which see].

THREAD WORMS. See *Worms.*

THROAT. See *Sore Throat.*

THRUSH is an affection of the mouth due to the growth of a parasitic yeast which forms white patches on the gums, cheeks and throat. The yeast may excite considerable inflammation of the mouth, though usually it does not do so. The condition is most common in hand-fed infants, caused by dirty bottles, by dummy teats, and general bad management. Such infants usually have diarrhœa and sore buttocks, which the mothers explain away by saying it is the thrush going through the baby. Really it is another result of the bad management which caused the thrush in the mouth. The *treatment* should be an improvement in the general management of the baby, and the application to the white patches of a mild antiseptic; honey and borax is the popular remedy and is good, though we recommend glycerine of boric acid applied gently with a camel's hair brush or swab of clean wool. Thrush occurs in the adult in the course of wasting illnesses, and also from wearing plates of false teeth over festering stumps, as is so commonly done by domestic servants at the present day. In such cases the servant usually gets sent to a fever hospital as a case of alleged diphtheria.

THYROID is a gland situated around the wind pipe in the lower part of the neck. It secretes a fluid which is

absorbed by the blood and regulates the nutrition of the body. When enlarged, the thyroid forms a tumor known as goitre.

TIC-DOULOUREUX. See *Neuralgia.*

TIGHT-LACING is now well recognised as injurious. By this malpractice the lower ribs are forced inwards, and the liver and spleen, which these ribs cover, are compressed and their functions embarrassed; moreover the colon is included in the area of pressure, and dyspepsia, constipation and appendicitis thus invited; whilst the important organs of the chest, viz., the heart and the lungs, are forced upwards and their action impeded. The effect on the general health likely to result from interference with so many vital organs can be readily imagined.

TINCTURES are solutions of the active ingredients of drugs in rectified spirit. The Pharmacopœia contains over 60. They are much stronger than infusions, the dose being either 5–15 drops or a half to one drachm, according to the drug.

TOAST WATER may be used freely in febrile conditions.

It is prepared by placing two slices of bread, well toasted, in a jug and pouring on a pint of boiling water. The whole is allowed to stand till cold, and the toast water is then poured gently off.

TOBACCO. See *Smoking.*

TOE. See *Bunion, Corn, Ingrowing toe-nail.*

TONGUE is liable to a great number of disorders. The little band of mucous membrane that passes from the floor of the mouth to the under-surface of the tongue may be too tight from birth. The condition is termed *tongue-tie*, and is easily remedied by a snip of the doctor's scissors. It is not present as often as the anxious mother imagines. The tongue becomes *coated* in many affections, e.g., indigestion, liver disorder, constipation, toothache, tonsillitis, gout, rheumatic fever and the infectious fevers. It is usually a bad sign when in the course of a severe illness a tongue previously coated with white fur becomes dry and brown. A tongue that is coated and clammy on waking every morning usually indicates gastric disorder, often from the use of spirits before going to bed. *Dryness* of the tongue on waking in people otherwise healthy may be due to sleeping with the mouth open. *A flabby tongue*, dinted at the margin by the teeth, suggests debility with dilated stomach. *Soreness* of the tongue may be due to tobacco smoking, spirit drinking, or the friction of a broken carious tooth. Such a condition should never be ignored; if neglected, cancer of the tongue may possibly develop. *Tremor* of the tongue when it is put out is common in debility, especially when due to alcoholism. *Difficulty in putting out* the tongue is common in St. Vitus's Dance, and in certain diseases of the nervous system.

For cleansing the mouth and tongue, the use of an aërated water, e.g., soda water, is valuable. It may be used as a gargle, or a swab of wool wound round a glass rod or stick, may be dipped in soda water and used to wipe the mouth with. The use of glycerine of borax one drachm, tincture of myrrh twenty minims and water one fluid ounce, is also a most useful mouth wash, both for cleansing the mouth and for stimulating a sore tongue to heal. Honey and borax is also good. Such remedies must not be used as a substitute for treatment directed to remove the cause of the unhealthy state of the tongue. The abuse of tobacco or alcohol, the presence of carious teeth, constipation, etc., must receive the attention they deserve.

TONIC is a remedy for debility of either the body as a whole or of any one organ. Thus we can have general tonics, e.g., fresh air, or a gastric tonic, e.g., gentian, a nerve tonic, e.g., arsenic and so on. A tonic differs from a stimulant; the former promotes the recovery of the normal strength, the latter whips up a flagging organ and makes it work well for the time at the cost of greater weakness afterwards. The best tonics are not drugs, but fresh air, sunlight, cold baths, exercise, sleep, regularity of the bowels, and suitable food. The much-vaunted port wine is, be it noted, not included among the best tonics. There is a great deal of unnecessary quinine and iron and other material consumed at the present time in an attempt to substitute drugs for regular habits; an attempt which fails in the long run. A free purge, a good sweat, and some form of regular and healthy exercise in the open air is usually the treatment required by those who resort to tonics. [See *Debility, Drugs.*]

TONSILLITIS is inflammation of the tonsil. [See *Sore Throat.*]

TONSILS are rounded bodies situated one on each side at the entrance to the throat. Their function is not certainly known, but they probably aid in protecting the body from infection. Tonsillitis, or inflammation of the tonsils, is a common complaint described under *Sore Throat.* Chronic enlargement of the tonsils is common in children, and often requires surgical aid.

TOOTH-ACHE should, as far as possible, be prevented by following the advice given under "Care of the Teeth." When present, it should be treated in the following way. An aperient should be taken, the face kept warm by cotton wool or bran poultices, and a spoon diet alone used. If this does not procure relief, a minute piece of cotton wool soaked in pure carbolic may be inserted into the cavity of the tooth, and then covered with a second small piece of wool soaked in Friar's balsam. This must be inserted lightly, and must be smaller than one would judge, because the tongue exaggerates the size of a cavity.

The pain of tooth-ache is often referred to the wrong tooth. This is due to the fact that the same nerve supplies by one branch part of the ear, by another part of the socket of the eye, by a third branch the teeth of the upper jaw, and by a fourth those of the lower jaw. It is a law in the physiology of nerves that irritation at any part of a nerve may be felt in the area supplied by any of its branches. Hence, not only may tooth-ache be felt in the wrong tooth, but ear-ache may be due to a wisdom tooth or neuralgia of the eye to a decayed tooth. Should pain be sufficient to prevent sleep, it is much wiser, if the above measures fail, to secure relief promptly by consulting a dentist.

TOURNIQUET is an appliance for checking hæmorrhage. [See *Hæmorrhage* under *First Aid.*]

TOXICOLOGY is the science of poisons—their effects, antidotes, and detection within the body or in suspected food.

TRACHEA is the wind-pipe.

TRACHEOTOMY is the operation in which the wind-pipe or *trachea* is opened. The wind-pipe having been opened, a tube made for the purpose is inserted and through this the patient breathes. The operation is required whenever obstruction in the upper air passages is sufficient to prevent satisfactory respiration, a condition most often met with in the diphtheria of infancy. [See *Diphtheria*].

TRADES. See *Death-Rate, Dangerous Trades.*

TRAINING is good for the healthy youth. Before beginning a course of strict training, a medical examination is requisite. The training should be gradual. The muscular work performed at first should be well within the powers of the future athlete. The point to aim at is not to strengthen the muscles so much as to strengthen the heart. Most people have muscular power out of proportion to their heart. Hence, when exerting their muscles to the full, they put a strain on the heart which is unequal to it and *dilated heart* results, a condition that may require a long time of enforced rest to remedy. "Good wind" means a heart equal to the strain thrown on it; "short wind" a heart that is not equal to it. Hence the great aim of the wise trainer is "to lengthen the wind." All causes that embarrass the heart must be avoided, specially during exertion, e.g., tight clothing, a full stomach or a stomach distended by flatulence, a cold on the chest, shallow breathing, or muscular effort with the breath held. Elaborate systems of dietary are obsolete. All that is really required is a diet easy to digest, so as to prevent flatulence and constipation, fattening articles of dietary being cut down though not excluded. Tea, tobacco, and alcohol, "the three domestic poisons," must be excluded or strictly limited, chiefly for the sake of the heart. The skin should receive extra care, as much work is thrown on the sweat glands. The limitation of the amount of water consumed is often unnecessarily severe, though fluid should

certainly not be taken between meals. Harm often results from the commission of a series of dietetic and other indiscretions directly the training is over.

TRANCE. See *Catalepsy.*

TRANSFUSION is the name of the operation by which blood was transferred from the arm of a healthy individual to that of a patient. This operation is now hardly ever performed, for it has been found by experience that the injection of water at blood heat, containing a teaspoonful of salt to the pint, acts just as well. The term is now used to indicate the latter operation. Transfusion is often resorted to during an operation if the patient is in a state of collapse. The nearest approach to it obtainable by the layman, is to give the same salt and hot water in the form of an enema. From one to two pints may be given after a severe hæmorrhage, or in any condition of collapse, the warm fluid thus given being soon absorbed into the circulation.

TRAPS are devices to prevent the escape of sewer gas from the drain into the house. Many of the older traps had the drawback that they allowed filth to accumulate in them. Such traps as the Bell Trap have been discarded on this account. A U or S shaped trap is the one now chiefly used. By having the drain pipe of this shape, whenever the drain is flushed some water is retained in the bent part or trap, which then prevents the passage of gas through this portion of the pipe. Such a trap is liable to certain drawbacks :—

1. When two closets one above the other discharge into the same soil pipe, flushing the lower one may suck the water out of the trap of the upper one. This is avoided by putting the pipe between the trap and the soil pipe in communication with the outside air by means of a small ventilating pipe known as the anti-siphonage pipe.
2. If the sewers are not well ventilated, sewer gas will collect in them until it is under sufficient pressure, when it will force the water out of the trap and escape into the house.
3. If the trap is not flushed regularly the water it contains will dry up and thus unseal the trap.
4. Every trap introduced into a drainage system impedes the flow of the sewage.

Traps should be placed immediately under the pan of the water-closet, and at the point of entrance of the soil pipe into the main drain. There should be no trap between these two points. Traps should also be placed immediately beneath the grating of all sinks, basins and baths, in spite of the fact that these pipes discharge over a gully without any direct connection with the soil pipe. By this means bad odours due to the accumulation of filth within the pipes is excluded, and any sewer gas from the gully, which may be sucked into the waste pipe by reason of the warmth of the house, is excluded also.

TRAUMA means an injury.

TREACLE soothes a sore throat and is slightly laxative.

TREMOR or **TREMBLING** is common in emotional states, in nervous debility, in old age, in poisoning by mercury or alcohol or tobacco, in exophthalmic goitre, and certain diseases of the nervous system, e.g., the shaking palsy. In most cases the hands suffer most and the tremor is most noticeable during the performance of any act with the hands, though in the last-mentioned disease the tremor is checked by movement and occurs during rest. Tremor in all cases ceases during sleep. The treatment is the removal of the cause, and when this is impossible, some improvement may be obtained by a quiet, regular life with freedom from worry or excitement.

TRICHINIASIS is a disease due to the invasion of the body by worms belonging to the species known as *Trichina spiralis.* The symptoms resemble those of typhoid fever. The worms gain entrance to the body in the meat obtained from infected pigs. The disease is most common in Germany. The disease may be prevented by thoroughly cooking the food. [See *Worms*].

TROPICAL DISEASES include many which are rare in more temperate climes. Recently a School of Tropical Medicine has been instituted, largely owing to the enterprise of Mr. Chamberlain. At this school research is carried on, and colonial surgeons and medical missionaries receive instruction in the diseases peculiar to the tropics. The occupation of the tropics by Europeans is in many cases awaiting the solution of the problems of the prevention and treatment of certain tropical diseases, so that the matter is one of pressing public importance. Among tropical diseases we may mention more particularly ague, beri-beri, cholera, dysentery, elephantiasis, Guinea-worm, liver abscess, sleeping sickness, and yellow fever. Information respecting these diseases will be found under their respective headings.

TRUSS is a mechanical support used by those who are ruptured, to prevent the escape of any portion of the abdominal contents from the abdominal cavity. [See *Rupture.*]

TUBERCULOSIS is disease due to the tubercle bacillus. Although the organs in man that are most frequently attacked are the lungs, other parts of the body are not immune. Tuberculosis of the lungs is popularly known as consumption, and was named by Hippocrates *phthisis,* a term that means literally wasting. The other organs most liable to attack are (1) the lymphatic glands of the neck, (2) the intestines, (3) the joints, (4) the bones, (5) the lining membrane of the brain, (6) the genito-urinary organs. It is thus seen that the same germ by attacking different parts of the body may produce very different symptoms.

When (1) the lymphatic glands are the seat of disease, lumps appear in chains up the sides of the neck—a condition formerly termed scrofula. These lumps are enlarged glands. They should not be painted with iodine, but cod-liver oil and fresh air, preferably Margate air, should be tried for some months, and if they do not disappear they should be removed by the surgeon whilst they are still hard. If neglected they will break down into cold abscesses and burst, leaving discharging wounds that heal very slowly.

When (2) the intestines are attacked, *consumption of the bowels* results, though this term embraces many other forms of infantile diarrhœa and wasting. In these cases the germ has been swallowed. In infancy the germ may be introduced by the habit of sucking the fingers, which have often previously picked up dust from the floor, more especially in houses inhabited by a sufferer from consumption; but the germ is more often introduced in the milk, as a large number of English cows are tuberculous. The latter risk may be avoided by sterilising the milk (see *Milk*). Consumption of the bowels is a common complication of phthisis, owing to the phlegm being swallowed instead of being expectorated into a suitable receiver as it should be. It has been proved that the stomach has no power to kill living tubercle bacilli which reach it.

When (3) the joints are attacked, usually the hip or knee, wrist or ankle suffer. *Hip disease* or *White Swelling* of the knee is the result. (4) Tuberculosis of the bones most often occurs in the spine, the familiar hunch-back being the deformity apt to result.

Of the other forms of tuberculosis, that of the skin causing *lupus* and that of the supra-renal capsules causing *Addison's disease* are worthy of mention. Moreover, *a general tuberculosis* occurs amongst children who are debilitated by an acute illness or who have been starved. In this condition the germs attack many parts of the body at once and produce an acute fever not unlike typhoid in its symptoms; such cases end fatally in a few weeks.

Between the years 1881-1890, one-ninth of the total death rate in England and Wales was due to tuberculosis. Of these cases, tuberculosis of the lungs was far and away the chief cause. In 142 consecutive post-mortem examinations made by the writer at a Workhouse Infirmary, 42 of the deaths, or nearly one-third, were demonstrated to be due to tuberculosis of the lungs. In this class of society, then, the ravages of the tubercle bacillus seem to be even greater than in society as a whole. The prevention and treatment of the different forms of tuberculosis is thus one of the chief medical problems of the day. The subject is dealt with more fully under *Consumption.* [Refer also to *Fevers, Hip Disease, Gland, Spinal Disease, Lupus, etc.*]

TUMOUR, literally a swelling, may be due to a great number of causes. It may consist of fat, fluid, cancer, etc.

No treatment should be adopted till after a thorough medical examination.

TURPENTINE. Common turpentine or "turps," when distilled, breaks up into a distillate named oil of turpentine and a residue known as resin. Oil of turpentine is used as a stimulating liniment in the form of either turpentine liniment or acetic turpentine liniment. Both are useful; turpentine and soap liniments in equal parts are also good. They are used as counter-irritants in pleurisy, neuralgia, and joint affections. Internally a turpentine enema dispels flatus. It should not be given by the mouth except by medical orders.

TYMPANITES means severe flatulent distention. A turpentine enema is usually required.

TYMPANUM, the drum of the ear. [See *Ear.*]

TYPHLITIS is the old name for appendicitis, which see.

TYPHOID STATE is characterised by prostration, low muttering delirium, and picking at the bedclothes. It is caused by many diseases, but always indicates a critical condition. The name is due to the resemblance of the symptoms to a severe case of typhoid fever in the third or fourth week of illness.

TYPHOID or **ENTERIC FEVER** was formerly often called gastric or low fever. Having been confused with *typhus* fever, which is really altogether different, it received the name of *typhoid* (*oid* meaning "like"), but is now more commonly called enteric. The *cause* is a germ which swims actively and lives in water a long time. It is known as the typhoid bacillus. The germs gain entrance to the body in water or milk that has been contaminated with sewage, or in shell fish, especially oysters and cockles, which have grown in water thus contaminated. In the South African war flies and dust carried the infection more frequently than happens at home.

This fever is wholly *preventable*. Improved drainage is always followed by a reduction in the prevalence of typhoid. In London, the drainage and the water supply are now so good that the typhoid has been greatly reduced. The cases that still occur are traceable to the consumption of shell fish, infected by having been grown in water contaminated by sewage, or to milk that has been diluted with polluted water. The disease is most prevalent in the autumn.

The *symptoms* consist of the following:—For a week, the temperature each night is a degree higher than the night before; there is languor, headache, loss of appetite, disorder of the bowels. During the second week the temperature remains continuously about 103° F. The rash appears during this week; it consists of rosy pimples on the trunk, which come out in crops, last a few days only and fade. The abdomen becomes distended; the tongue coated with a red tip; the motions assume a liquid yellow character; the mind becomes dull. In the third week improvement occurs in the milder cases, but in the severe cases the third and fourth weeks are an exaggerated picture of the second week. The patient wastes, and sinks into a low muttering delirium in which he picks at the bed-clothes; his tongue becomes dry and cracked; his teeth coated with a tartar that reforms as fast as it is removed. Death from exhaustion usually follows.

The *nature of the disease* may be thus summed up:—germs of typhoid pass unharmed through the stomach and take root along the small intestine. Here they multiply and cause ulcers. From these ulcers the germs are absorbed into the blood stream and circulate in it. The blood is poisoned, fever, wasting, and delirium result. The germs are discharged in the motions, the urine, and the sweat. All three therefore are highly infectious. The *treatment* requires a doctor and a hospital nurse. If delirium is a marked feature, a second nurse will be required. The room must be prepared in the way suitable for an infectious case. [See *Sick Room*].

Certain special points require emphasis. The bowels are ulcerated and at these points are as thin as paper; if the bowel gives way, death is almost certain. The ulcers are not healed till ten days after the temperature is normal. Therefore, from the onset to the end of this time fluid diet alone is given. During the ten days after the temperature has reached normal, the craving for solid food is intense; the temptation to a fond relative to gratify this craving is great; but such temptation will be resisted by anyone who bears in mind that perforation of the bowel, in the condition of the invalid, is as easy as it is fatal. The death rate has been much lowered of late by the cold-water treatment, which is carried out by lowering the patient, in a blanket, into a bath of cold water at the bedside. Relatives often resent this, but it is foolish to do so, as this treatment calms delirium, secures sleep, reduces the fever, and preserves the strength. Shivering is often caused, but this is not serious. In regard to the bowels, give no aperient unless specially ordered, but use enemata only. If the temperature drops suddenly or bleeding occurs from the bowel, keep the patient very quiet, avoid brandy, apply cold to the abdomen, let him pass his motions into a draw sheet so as not to disturb him, and send for the doctor at once.

> In helping to nurse these cases bed sores are to be dreaded and to be guarded against by the strictest cleanliness and thorough drying after each action of the bowels. There is considerable risk of contagion being carried by the fingers to the mouth of the nurses. This accident is to be most carefully prevented in the following way. Before attending to the patient scratch a piece of soap; you will thus plug each nail with soap and prevent infection getting under the nails. After you have attended to the patient immediately wash the hands thoroughly and then immerse them in water containing perchloride of mercury (one part in 2,000). Leave them in this while you count a hundred; this takes much longer than you think. The motions and urine are both to be received into vessels that contain some disinfectant. All soiled linen must be soaked in some disinfectant, e.g., carbolic lotion (one part in 40) for some hours before going to the laundry. The patient must be kept lying down at all times *without any exception whatever.*

After recovery, a long holiday is requisite, the convalescent may become very fat, but this condition rectifies itself in about a year.

TYPHUS FEVER has now been practically stamped out in Great Britain by improved sanitation.

ULCER is a discharging sore. It is most commonly met with on the leg. It is rare in youth, but common in middle age amongst those whose trades involve much standing, e.g., laundry work. Bad circulation usually produced by varicose veins is the chief cause. Our workhouse infirmaries contain a great number of intractable cases, as the ulcers heal with rest in bed and often break down again directly the patient resumes work. The treatment should be rest in the horizontal position, and suitable antiseptic treatment of the sore [see *Wounds.*] When the sore is clean it may be stimulated to heal with yellow oxide of mercury ointment applied to the sore only and not to the healthy skin. [For ulcer of the cornea, see *Eye.*]

UNCONSCIOUSNESS. See *Fits* under FIRST AID.

URÆMIA is blood poisoning due to deficiency of kidney action. [See *Kidney.*]

URETER is the tube that puts the kidney in communication with the bladder. It is the passage of a stone down this tube which causes renal colic. There is a separate ureter for each kidney.

URETHRA is the canal by which the bladder communicates with the exterior.

URINE consists of water, salts, nitrogenous waste products and colouring matter. Normal urine is acid in reaction, that is to say it turns blue litmus red. In abnormal conditions the urine differs from the normal in many ways, some of which are obvious at a glance, whilst others are only detected by careful analysis. The *quantity* passed is much increased by nervous excitement, hysteria, diabetes and chronic Bright's disease; it is diminished by diarrhœa, vomiting, fever, and acute Bright's disease. The *colour* is higher the more concentrated the urine is; it becomes a mahogany brown in jaundice, green in carbolic acid poisoning, smoky when it contains blood from the kidneys, blood red when it contains blood from the bladder or urethra; a deep orange or gamboge yellow may be produced

by taking certain drugs, notably rhubarb and senna. The *odour* is altered by certain drugs, e.g., turpentine and certain articles of diet, e.g., garlic, but these are of little moment; when, however, the urine is offensive when first passed, inflammation of the bladder is present. The *reaction* may be made alkaline by taking soda or potash salts, but not by taking ammonia. It is also alkaline in inflammation of the bladder. The presence of a *sediment* is always worthy of notice. In cold weather or in very hot weather the urine, after standing some time, is apt to form a precipitate, which has a brick-dust colour and is soluble in hot water. Such a sediment need give rise to no alarm, but whenever a sediment is present in urine *directly* it is passed, the fact should be reported to the doctor. [Refer to *Bladder*, *Gravel*, *Gout*, *Prostate*.]

URTICARIA. See *Nettle-Rash*.

UVULA is the fleshy appendage of the soft palate that hangs down in the mid-line and is raised in the act of saying "Ah." [See *Sore Throat*.]

VACCINATION. This method of protection against small-pox was introduced by Dr. Jenner, an Englishman, in the year 1798. Before this date Lady Montagu introduced the practice of inoculation from Turkey. This consisted in the inoculation of small-pox matter during robust health. By this means an attack of small-pox was induced, which was usually mild and gave protection from subsequent attacks. The danger of this method was that not only might the attack be severe, but it often started an epidemic of small-pox. Vaccination, on the other hand, never produces an attack of small-pox nor starts an epidemic. The lymph with which vaccination is performed is obtained from calves suffering from the disease known as vaccinia or cow-pox. Jenner observed that the milkmaids escaped in many epidemics of small-pox, and found that in these cases the cows had cow-pox. Thus in milking them the milkers had vaccinated themselves. Since this discovery inoculation has been prohibited by law, and vaccination enforced. So great has been the success of this method that in nearly all the countries of the civilised world the disease has been almost forgotten, instead of being a source of daily terror. The result is the production of anti-vaccinators. These in various countries and at various times diminish the thoroughness with which the law is enforced. For a few years all goes well, then follows a terrible epidemic, and the anti-vaccinators and every one else are vaccinated. After this outbreak the law is enforced more rigidly for a time, but gradually the pressure of public opinion slackens into indifference, and history repeats itself, as it always will under the same conditions.

The Vaccination Act of 1898 is on its trial and will probably require modification, but it has certainly effected one much-needed reform, for it abolished arm-to-arm vaccination, and permitted the public vaccinators to use calf-lymph only, thus preventing the risk of contagion, as the calf is killed and proved to be healthy by post-mortem examination, before any of the lymph obtained from it is permitted to leave the laboratory. Another improvement effected by the Act of 1898 is the abolition of vaccination stations, the medical officer being by the Act required to attend each case at its home. Epidemics of measles, whooping cough and the like, which were, at times, started by the collection of infants together at the vaccination stations, are thus no longer produced in this way.

The most suitable *age for vaccination* in the healthy infant is six weeks, though the law permits any time up to six months. Vaccination should be performed in four or five places, for not only is the protection afforded thus increased, but the effect on the arm is less severe than when only one point of inoculation is chosen. If desired, vaccination may be performed on the leg, so that the scars do not show, but it is difficult to keep the leg of an infant always clean and dry, and in the adult, if this site is chosen, the probability of being unable to walk for a few days should be borne in mind. After vaccination has been performed, the child becomes fretful about the fifth day. About the ninth day the skin around the vaccination spots becomes red and swollen, and remains so for a few days. The glands in the arm-pit may swell. The scabs fall off between the fourteenth and the twentieth days, leaving red pitted scars which become pale only after some time.

The *danger* of vaccination with calf-lymph is practically limited to the risk of the vaccination sores becoming poisoned owing to carelessness after the operation. It is usual to protect the arm with a piece of lint secured by strapping. This must be left undisturbed and kept dry; the child should have its daily bath as usual, but the vaccinated arm must be kept out. When the arm swells the strapping may become too tight and may require a slight snip with a pair of scissors, so as to slacken it without cutting it right across. The arm should be guarded from accidental knocks. The diet should be the same as usual.

In working amongst the poor, district visitors and others must expect to hear of an endless chapter of accidents attributed to, and dating from, vaccination. The ignorant, like many well-informed people, fail to distinguish the "post hoc" from the "propter hoc"; and thus skin eruptions, due to neglect or to vermin in the scalp, are commonly laid at the door of vaccination.

RE-VACCINATION. The protection given by vaccination gradually diminishes as time goes on. Experience shows that after ten years it is time to be vaccinated again. In Germany this is compulsory, in England it is not, but it is none the less a wise precaution to have re-vaccination performed before leaving school. During an epidemic of small-pox and before going abroad it is also wise to be vaccinated again. The effect on the arm is usually much milder than after vaccination for the first time; but if no reaction occurs at all, it is unwise to at once assume that small-pox need not be feared, as there are brands of lymph on the market, especially during a small-pox epidemic, which are not always reliable. In such cases, vaccination should be again performed with another brand of lymph, and only after two or three attempts should the assumption be made that the vaccination will not take. The public vaccinators, who alone can use Government lymph, return a very much smaller number of cases as immune to vaccination than the private practitioners do, showing that the quality of the lymph used is of much importance.

> Those interested in the subject of vaccination and anti-vaccination will find an article in the Encyclopædia Britannica giving evidence for anti-vaccination, and an article in Clifford Allbutt's System of Medicine, Vol. II., p. 657, giving abundant evidence for the utility of vaccination; the Annual Report of the Metropolitan Asylums' Board for 1902 is a valuable contribution to the subject, as it gives an analysis of the cases treated during the London epidemic of that year. The analysis is drawn up so as to show the relation of severity of attack, not only to the presence or absence of vaccination marks, but also to the size and number of such marks when present, and to the time since vaccination had been performed.

VAPOUR BATH. See *Baths*.

VARICELLA. See *Chicken-pox*.

VARICOSE VEINS are veins which, having been unequal to bear the pressure of the blood within them, have become dilated and tortuous in consequence. Their valves no longer act. The condition is most common in the legs, especially of tall people who have much standing. It is also produced by obstruction to the circulation in the legs or abdomen, e.g. by tight garters, pregnancy, congestion of the liver, etc. The tendency to the condition is greatest in middle age, and women are more liable to it than men. The *symptoms* produced are pain, numbness or stiffness in the affected part. The nutrition of the skin often suffers, and swelling, eczema or ulcer of the leg are then likely to develop. The *treatment* should take the form of some support; either an elastic stocking or an elastic bandage may be worn. It is important that the pressure these exert should be greatest at the foot and least at the knee; hence the stocking presents an advantage over the bandage, as the latter, which is applied from the ankle upwards, when put on by the patient himself, tends to be tighter with each turn, and so to be loose at the ankle, tight at the knee,

and thus worse than useless. In rare cases the veins may require removal by the surgeon. [For treatment of a ruptured varicose vein see *Hæmorrhage* under FIRST AID.]

VARIOLA. See *Small-Pox.*

VASELINE is prepared from petroleum, and thus, unlike animal fats, it does not turn rancid. On this account it is valuable as an ointment.

VEAL. See *Food.*

VEGETABLES. See *Food.*

VEGETARIANISM is a diet from which animal food is excluded. Such a diet is the common one for the poor of certain tropical countries, but is unusual in this country. When practised here, a modified vegetarian diet is usually adopted, fish, flesh, and fowl being excluded, but eggs, milk, butter, and cheese being admitted. The advantage of a vegetarian diet of this kind is cheapness. Nitrogenous food in the form of peas, eggs, or cheese is cheaper than in the form of fish, flesh, or fowl, but it is not so easily digested. For the gouty, a restriction of the amount of meat eaten is certainly wise, but for the average man there is little doubt that the ordinary mixed diet is the best, though perhaps it might be eaten more slowly and in smaller quantity to advantage. The evidence against a strict vegetarian diet is as follows:—

1. A comparison of our teeth with those of purely carnivorous animals on the one hand and with purely herbivorous on the other, points to our teeth being adapted to a mixed diet.
2. The length of the food canal of the purely carnivorous is relatively short and its structure simple; the length of the food canal of the herbivorous is relatively long and its structure complex; the length and the complexity of the human food canal occupies a position midway between these extremes.
3. The time herbivorous animals spend in feeding is far greater than man can afford for the purpose.

VEINS are the blood-vessels that return the blood to the heart from that network of minute blood-vessels termed capillaries, which occur in nearly every part of the body. The veins of the limbs and of the surface of the body are furnished with valves which permit the flow of blood towards the heart only. The circulation in the veins is slow and feeble compared to that in the arteries, and is readily retarded by the pressure of tight clothing. The circulation in the veins is largely dependent on muscular action, as the muscles compress the veins when they act and the valves then come into play, and only allow the blood to be squeezed onwards. If the valves become defective, circulation is much impeded, and "varicose veins" usually result. The veins of the viscera, which are devoid of valves, are specially prone to engorgement and to varicosity; for instance, piles are varicose rectal veins. [For the treatment of a *Ruptured Vein* see *Hæmorrhage* under FIRST AID; see also *Varicose Veins, Heart, Blood-Vessels.*]

VENISON. See *Food.*

VENOMOUS BITES. See *Bites.*

VENTILATION is the renewal of the air contained in a room. The necessity for such renewal increases with the number of people occupying it, and the number of lights burning in it. Both lights and people, alike, use up the oxygen of the air, and discharge into it a certain amount of carbon dioxide; but the human breath has a more noxious effect than the flame of an ordinary lamp or gas-jet, for it emits a certain quantity of highly poisonous organic matter, and it is chiefly this which vitiates the air and gives it the well-known "stuffy" odour. The amount of the organic matter in the air of a room bears a constant ratio to the amount of carbon dioxide present as the result of breathing. This carbon dioxide of human origin is the most convenient indicator that we have for estimating the state of the air in a room, as it is much easier by chemical analysis to measure this gas than to measure the organic matter.

The amount of carbon dioxide present in fresh country air is 4 parts in 10,000. In a dwelling-room it must not be allowed to rise permanently above 6 in 10,000, or the air will be harmful. Though for a short time we can tolerate air far more vitiated than that containing 6 parts in 10,000 of carbon dioxide, as in a theatre or underground railway, yet even a short exposure to such air, if repeated daily, has an injurious effect on health. The air of a dwelling-room can seldom be as pure as the air outside; hence in those forms of illness in which pure air is a vital matter the open-air treatment has to be adopted.

In order to prevent the carbon dioxide rising above 6 per 10,000, 3,000 cubic feet of fresh air per hour for each person is requisite. The air cannot be changed more frequently than three times an hour, without causing an unpleasant draught, unless the fresh air is warmed before it is admitted; hence in the ordinary room an air space of 1,000 cubic feet each person is required. The law permits an air space of only 300 cubic feet per head in common lodging houses, 300 in workhouses, 600 in barracks, and 800 in prisons; whilst school dormitories usually give the 1,000 cubic feet recommended above, general hospitals 1,200, and fever hospitals 2,000.

In calculating the air-space, the height must not be reckoned above 12 feet, however lofty the room. This is a practical point of great importance, the reason for which may not be clear at first sight. Everyone is aware that air which has been breathed is warm and that warm air rises; hence one is inclined to think that if the room is sufficiently lofty the bad air will all accumulate near the roof and the air near the floor will not be vitiated for many hours. Such a delusion is rudely shaken by the vitiated atmosphere so common in churches. The explanation is that air which has been breathed is only lighter than fresh air on account of its warmth and moisture. The warmth, however, is soon lost, and the moisture condenses, causing the bad air to become heavier than the fresh; hence the expired air at first rises and then sinks, and, as a matter of fact, it rarely rises higher than 12 feet before it becomes cool and descends. To secure the ventilation of a dwelling-room, then, we require no ceiling to be higher than 12 feet, but the windows should reach the ceiling and be open at the top. A fire-place should always be present, and the chimney register should never be closed. The window and the chimney are the two simplest and readiest means of ventilation. "Windows were made to be opened, doors to be shut." It is a common error to ventilate the room into the passage by leaving the door open and the window closed. Among the simplest aids to ventilation are the following:—

(1) *Perforated bricks* communicating with the room by gratings, which serve to break up the current and thus prevent the draught from being felt.

(2) *Boyle's valve* inserted in the chimney near the ceiling. This contrivance consists of an aperture leading into the chimney with two talc flaps, forming a valve, which permits the air of the room to enter the chimney, but prevents the smoke from entering the room.

(3) *Louvre panes*, consisting of slips of glass placed obliquely in an oblong opening cut in the window pane. They are commonly used in shop windows that do not open. The Cooper rose ventilator is on the same principle.

Many have been the attempts, more or less successful, to admit fresh air without causing unpleasant draughts. The aim has been to dilute the cold fresh air with that of the room before it comes in contact with the occupiers of the room. The following are among the chief devices adopted:—

(1) *Hinckes-Bird's method* consists in raising the lower sash of a window a few inches and blocking up the opening with a board, thus allowing the fresh air to enter the room, but only between the two sashes and with an *upper* current.

(2) A *Tobin's tube* is a pipe the lower end of which communicates through an opening in the wall with the outside air, whilst the upper end opens into the room about six feet above the floor.

(3) A *Sheringham valve* is a metal guard placed around an aperture in the wall, so arranged as to direct the incoming air upwards, and made to work on a hinge so as to close the opening when desired.

(4) A *Galton's Grate* has an air-space behind the chimney, communicating below with the outside air and above with the interior of the room, the heat of the chimney being in this way used to warm the incoming air.

In most public buildings the above methods are insufficient, and have to be supplemented by some contrivance for pumping fresh air in and drawing the impure air out. In such cases the incoming air is usually warmed by passing it over radiators composed of steam or hot-water pipes. It is important that the fresh air should not be unduly heated, for otherwise the fresh air will rise directly it enters the room, and so not only be of little service to the occupants but actually a detriment by checking the upward current of foul air. The extraction of the bad air may be effected (1) by the use of Boyle's self-acting air-pump ventilator, or (2) by means of shafts heated with gas-jets or steam, or (3) by the action of electric fans. The relative positions of the inlet and outlet shafts is important, as it is possible to have them so placed that the fresh air is drawn out as soon as it is admitted.

One authority, Mr. Kenneth Gray, holds that the fresh air should be pumped into the upper part of a large public room and the impure air extracted "at or near the floor level." This view is based on the fact already mentioned, that foul air is heavier than fresh as soon as it has lost its warmth and its moisture has condensed.

Pure air is not only essential to health but to efficiency. If the employer wishes to get the maximum work out of his men, if the schoolmaster expects close application on the part of his scholars, and if the clergyman desires sustained attention from his congregation, then must they each ensure efficient ventilation. [For ventilation of Sewers refer to *Drains*.]

VERMIN. See *Lice*.

VERTEBRA. See *Spine*.

VERTIGO. See *Giddiness*.

VINEGAR is a diluted form of acetic acid. Meat soaked in vinegar becomes tender as the material that cements the fibres together becomes dissolved. Vinegar is also used to relieve thirst and to modify the taste of salad and other oils. Equal parts of vinegar and water may be used as a cooling lotion with which to bathe the forehead in headache, or the skin generally in fever. Internally the medicinal use of vinegar is slight; as a gargle, two drachms of vinegar to the ounce of water may be useful, but the repeated use of vinegar as a cure for obesity is to be condemned, as it only acts by setting up a gastro-enteritis, and so checking the absorption of nutriment. *Aromatic Vinegar*, made by adding oil of lavender, cloves, and the like to white vinegar, was formerly regarded as a disinfectant. It is now supplanted by efficient disinfectants, e.g. Jeyes' fluid, Izal, etc. *Raspberry Vinegar* used diluted with water to quench thirst in fever is inferior in the writer's opinion to those drinks mentioned under *Beverages*.

VIS MEDICATRIX NATURÆ is the healing power of unaided nature. Every living creature, be it plant or animal, has some power of repair after the receipt of an injury not instantly fatal. Exposure to injury by accident, changes of temperature, or the attack of parasites, is a part of the environment, and therefore every old-established race is adapted to this part of its environment, for were it not the race would in all probability have become extinct. Adaptation to the receipt of injury without serious consequences ensuing consists in the possession of the power of repair, which is called into action by the injury itself. The thoroughness of this power of repair varies in different species and in different individuals, and it is a fascinating study to trace the *vis medicatrix naturæ* step by step from the lower forms of life to the higher. If we do so we shall find the power of repair in certain organs much greater in some of the lower forms of life, and at first sight this may occasion surprise. Why, for instance, should a crab be able to grow new limbs, whilst a man can only grow a new nail? It is not because the limb of a crab is a simple structure, for it is nearly, if not quite, as complex as a human limb. In the writer's opinion it is because each race is endowed with a power of repair for those accidents which most often befall it; the loss of a limb is common in crab life, rare in human life. In the same way tropical diseases affect the native less severely than the European visitor; whilst measles, a European disease of old standing, when imported for the first time into the South Sea Islands, caused a mortality amongst the Aborigines out of all proportion to that which it produces in Europe. Many other examples could be quoted.

VITRIOL is sulphuric acid. Vitriol-throwing may cause blindness if any of the fluid enters the eye. The best treatment in such a case would be at once to bathe the eye thoroughly with a weak warm solution of washing soda or with lime water, and then to drop in some castor oil from the end of a clean match, whilst the lower lid is drawn down by the thumb of the left hand. The skin may be bathed in a strong solution of washing soda at any part on which the acid has fallen, and should then be protected from the air by rags smeared with vaseline.

To make the most of the *vis medicatrix naturæ* possessed by each individual patient, is the secret of the healing art, and when this power of repair is thought to be feeble, the surgeon dare not perform an operation except as a last resource. In the average individual, if an injured organ can be put at rest, nature will heal it; hence the surgeon sews up a cut and excludes germs, or sets a broken bone and keeps it in splints and leaves nature to do the rest. Again, bowed legs caused by walking whilst suffering from rickets will often grow straight if the patient be kept off his legs soon after the deformity has arisen. In such a case, to straighten the legs, by surgical means, would be unjustifiable. It is only when nature has failed that a surgeon should operate. In fevers, perhaps, more than in any other group of diseases, reliance at the present time is placed on the *vis medicatrix naturæ*, a force which we have learnt to respect in a way very different from that entertained by our fore-fathers, who spared no effort to exhaust the patient so as "to leave the fever no food to feed on," a mode of treatment that hardly fulfilled Hippocrates' exhortation "to at least do no harm." In the future, nature's healing power will no doubt be supplemented by the use of antitoxins, which will then be available for each fever instead of only for diphtheria and for one or two others, as at present; meanwhile reliance has to be placed mainly on nature's remedial force and comparatively little on drugs.

To judge the value of any remedy is very difficult, owing to the natural tendency to recovery which we are considering. Hence much error arises and recovery may be attributed to a remedy, whilst in reality it has been wrought by nature, either quite independently of the supposed remedy or even in spite of it. The vast number of quack medicines and systems of cure, e.g. the use of "electric belts," etc., which in turn receive enthusiastic support from people, otherwise intelligent, is familiar to everyone, and is an example of the difficulty of separating the effect of a remedy from the effect of nature's power to heal. We are indeed all apt to resemble the fly in the ancient fable which, perched on the axle, watched the chariot wheels revolve and fondly imagined itself the cause. The doctor, however, is keenly alive to this tendency, the credulous believer in quackery is not.

VOICE. See *Larynx*.

VOMITING, like swallowing, is a muscular act controlled by the nervous system. The nerve centre which controls this act, situated in the medulla oblongata, is termed the "vomiting centre" (see *Brain*). The act is not under the control of the will, but is produced whenever the vomiting centre is irritated. The various *causes* of irritation may be classified thus:—

(*a*) Causes acting *directly* on the vomiting centre, e.g. (1), interference with the circulation of the brain, as in migraine, concussion, meningitis, tumour on the brain, and (2), the supply of impure blood to the brain as in fever, Bright's disease, and many poisons.

(*b*) Causes acting *indirectly* on the vomiting centre from irritation of other organs, e.g. (1), mental disturbance by unpleasant sights, sounds, and smells, or by severe pain; (2) irritation of the nerves of the throat, stomach, and other viscera, as in tickling the throat with a feath[illegible].

prolonged coughing, an irritating poison or indigestible meal, the pressure on the stomach due to tight lacing, ulcer of the stomach, constipation, worms, appendicitis, or strangulated hernia, etc.

Vomiting is thus seen to be a symptom often present, the cause of which may be trifling or very serious. When due to a poison or to indigestion, it may be a natural remedy of value, but as a rule it is a symptom that may be checked to advantage provided its cause has been first detected. Vomiting accompanied by a rise of temperature is a common mode of onset of one of the fevers, whilst vomiting accompanied by constipation may be caused by intestinal obstruction. In both cases medical aid is essential. In *infancy*, vomiting is especially common, and is then most often due to over-feeding or to unsuitable food (see *Infants*). In *childhood*, it is commonly due to over-eating, or to a fall on the back of the head. In such cases rest, quiet, and some water to drink are advisable, and a dose of grey powder or the soda and rhubarb mixture recommended under *Rhubarb* should be given. The child should be kept under observation, and if any other symptoms develop, the doctor should be informed. Repeated attacks of vomiting may be due to worms, but when accompanied by headache—the so-called "bilious attacks"—the symptom is usually due to congestion of the brain resulting from eye-strain, and the remedy is to be sought in the use of suitable spectacles (see *Bilious Attack*). Vomiting in the *adult* is not induced by such slight causes as in early life, and unless definitely connected with an indiscretion in diet, it is wise to regard it as a symptom demanding medical attention. The remedies to check obstinate vomiting to which the layman may safely resort, when no medical aid is at hand, include :—

(1) Sips of very hot water ; (2) small quantities of aerated water or champagne, preferably iced ; (3) one minim of ipecacuanha wine in a teaspoonful of hot water every half hour whilst the vomiting persists ; (4) bismuth lozenges, 1 to 6 every three hours.

[*Sea-sickness* is treated separately under that heading. Refer to *Emetics*, *Drugs*, *Poisons*.]

WALKING is one of the best forms of exercise. [See *Exercise*].

WALLS should be dry and clean. Cleanliness is promoted by smoothness of surface, and by material which can be cleansed with a damp duster. In hospitals glazed brick is largely used on this account, and smooth plaster is also used instead of paper. Wall papers should be smooth, coloured with aniline or other harmless dyes, arsenic and lead being eschewed, and they should be fixed to the wall with material that does not turn sour ; bad size used for this purpose is particularly noxious. The practice of pasting the new paper over the old one is to be strongly condemned, and is one cause of the insanitary nature of many a poor man's dwelling.

WARMING should be considered in relation to ventilation. The old-fashioned open grate consumes a large quantity of fuel for the heat it yields, as most of the heat goes up the chimney, but it makes the chimney a valuable ventilation shaft, which many more economical grates and stoves do not. Slow combustion grates are, however, desirable if ventilation can be effected in other ways ; thus the grates devised by Pridgin Teale and Lionel Teale respectively may be found useful. Gas stoves should never discharge their fumes into the room ; such stoves described as self-consuming are on the market and should be eschewed ; nor should the gas stove be placed in front of the fireplace and discharge its fumes through a small pipe, whilst the remainder of the chimney is blocked up, as a valuable aid to ventilation is thereby lost ; the gas stove should be placed in the grate itself and the chimney be just as open as for a coal fire ; when arranged in this way gas makes a healthy and convenient form of fuel. Closed stoves greatly economise fuel at the expense of ventilation. They often give the room a stuffy odour, probably from organic matter in the air being charred by contact with the stove, and also from the fact that hot iron is porous and permits the escape of some of the gaseous products of combustion through it. Trays of water on or around the stove prevent the unpleasant drying of the air that stoves and hot-water pipes often cause. An economical method for large rooms is the use of steam or hot-water pipes. Another method is to warm the air before it enters the room by the use of a Galton grate or other means. Probably the healthiest method is to use open fireplaces and also to warm the incoming air slightly in cold weather [see *Ventilation*].

WARTS are outgrowths from the skin, due to a cause not yet known. They occur at all ages. In youth they are exuberant, in old age flattened. They may occur in crops or singly. When occurring in crops they not infrequently come out suddenly and disappear as suddenly, as though dependent on some nervous or other constitutional cause. It is owing to this fact that charms have been used so much in the past to cure them. Single warts usually last much longer, and in later life they may become the seat of cancer. Warts are not limited to the skin, as they occur in the throat, bladder, and elsewhere. The *treatment* should be attendance to cleanliness and to the general health. The warts, unless present on the face or in large numbers, should be destroyed by some caustic. Glacial acetic acid painted on every night till the wart is destroyed completely is an efficient remedy. The skin around the wart should first be protected with vaseline, and the acid should then be applied on the end of a wooden match. A sore is often left, which soon heals if it is protected from the air with a little boracic ointment spread on linen. A saturated solution of salicylic acid in collodion painted on every night is also a good remedy. The most rapid in their action are caustic potash or fuming nitric acid, but these remedies are not so safe in lay hands. Whatever chemical is used, the treatment must be thorough or the wart will only be stimulated to grow. *Warts on the face* should not be touched except by medical orders, as scarring will result if the caustic is not applied skilfully, and also because in elderly people a condition allied to cancer, viz., rodent ulcer, begins in a growth easily mistaken for an ordinary wart.

WASHING. See *Disinfection*, *Infancy*, *Soap*.

WASTING may affect a part of the body only, as in a limb that is paralysed, or it may affect the body as a whole, producing a general wasting. A rapid loss of flesh should always arouse attention, though some loss of weight is normal at puberty, and often occurs also in advanced life. The cause of wasting may be starvation, indigestion, the loss of nutriment through abnormal channels, or the presence of poison in the circulation. In starvation, of course, sufficient food is not taken. In indigestion, though sufficient is taken, it is not all absorbed, hence the body suffers from lack of nourishment.

Loss of nourishment by abnormal channels occurs in—(1) *diabetes*, in which the food turns to sugar and is expelled in the urine, (2) *Bright's disease*, in which albumin is discharged in the urine, (3) *Sinuses*, which by continually discharging matter waste nutriment, (4) *Tape-worm*, which consumes the food before it can be absorbed. Examples of poison circulating in the blood may be found in the majority of acute and chronic diseases, notable amongst which are consumption, typhoid, and cancer.

Nature's power of repair is well illustrated by wasting. The less important organs waste more rapidly than the others. They are used as food to support the vital organs, for a starving animal feeds on its own flesh ; indeed many animals that hibernate put on fat before the winter sleep, and live on this throughout the winter. Analysis has shown that in starvation the fat and muscle waste rapidly, whilst the brain and heart waste very slowly. In disease certain variations in the type of wasting may occur ; thus in consumption the chest and limbs show more change than the face, whereas in cancer in the abdomen the face wastes as much as the rest of the body.

The most common causes of severe wasting are :—in *infancy*, indigestion due to unsuitable food or to chill ; in *youth*, phthisis ; in *middle age*, cancer or chronic indigestion.

WATER ranks next to air in ministering to life, for it forms the chief ingredient in all living tissues and animal

juices. The amount consumed daily by the adult should be on an average three pints, though allowance has to be made for variation in the amount of water lost in perspiration and other ways. The amount required in childhood is proportionately greater than in adult life; hence one should be slow to limit the quantity consumed by a child. In addition to its value as a beverage, water is invaluable in promoting cleanliness and so in checking the outbreak of infectious diseases. Practical sanitarians find that not less than 17 gallons per head should be delivered to each house, and that 10 more should be allowed for trade and municipal purposes. The quantity supplied in London greatly exceeds this.

The *dangers* of water are due to its impurities, which include:—

(1) Germs, especially of typhoid, dysentery, cholera, and some varieties of diarrhœa.
(2) Eggs of certain parasitic worms.
(3) Mineral matter in excess, which in the course of time promotes the formation of goitre, gall-stones, and gravel.
(4) Lead, which may cause lead-poisoning.

As to the *origin of impurities* in water, it is clear that those marked (1) and (2) arise from pollution with sewage, that (3) is due to the rocks, especially limestone and chalk, through which the water percolates; whilst (4) is caused by the lead pipes through which the water passes or the lead cistern in which it stands. Hard water—which owes its hardness to the mineral matter it contains—is not nearly so easily tainted by lead as soft water. The water most seriously infected in its passage through lead is soft water from a peat district, such water being rich in vegetable acids that dissolve the lead rapidly.

In the management of the *water supply* of a town the engineer is guided by the facts above stated. The excessive hardness of water is diminished by chemical means, and when the water is of such a nature as to make lead-poisoning a danger, it is treated by filtration through beds of flint and chalk, by which it acquires the necessary hardness. When the water is derived from a river into which sewage has been discharged higher up the stream, it is drawn off as far as possible from the source of pollution, and filtered and aërated under scientific supervision. In all cases, care has to be taken that the water does not become polluted after leaving the reservoir. Two sources of danger have to be guarded against: (1) aqueducts and sewers are apt to communicate through slight leaks if they are laid side by side; (2) cisterns are liable to become filthy through neglect, or to be left uncovered, with the result that a bird or some animal finds in it a watery grave, Happily, the continuous supply system renders cisterns unnecessary.

Water derived from *wells* is by no means safe from pollution; if a well is shallow, the risk of sewage contamination is often considerable. A well should be deep, and have its sides protected by some waterproof material to prevent the surface water from entering it. The best wells are those driven right through the first impervious stratum, so as to tap the one lying below. The water thus obtained has travelled a considerable distance in the earth, and has thus been thoroughly filtered. In London, for instance, by boring through the London clay into the chalk beneath, water is reached which has percolated through the chalk of the Surrey downs.

The further *purification* of water drawn from the tap in our great towns is unnecessary, and is not recommended; indeed many of the filters in domestic use are actual sources of danger. When, however, the only water obtainable comes from an unknown or from a suspicious source, some means of purification is highly desirable, as the prevalence of enteric fever, in India, the South African War, and elsewhere testifies. Three remedies exist:—(1) filtration, (2) boiling, (3) chemicals. The only *filter* that we recommend is one on the Pasteur-Chamberland principle (see *Filters*). *Boiling* is effective, but it takes so long for the water to cool again, that to a thirsty man this method is useless, unless he is prepared, as the wise traveller often is, to quench his thirst with tea. The addition of *chemicals* has been largely tried. Alcohol has obvious drawbacks of its own, and many of the other chemicals that kill germs, either make the water poisonous or nauseous; thus Condy's fluid has been tried in the army, but such water was not popular, as can be readily understood. The best device up to the present is one recently patented by Mr. Nesfield, a surgeon of the Indian Medical Service.

> It consists of a small tablet made in two halves, one of which is coated with gelatine so that its contents are not dissolved by the water until the gelatine has been first absorbed. On dropping the tablet into water one half at once dissolves and sets free chlorine that kills the germs; within a few minutes the gelatine coating of the other half is dissolved, and this half then acts on the chlorine and changes it to a harmless chloride. The result is that within ten minutes the germs have been destroyed, the chlorine removed, and the water kept safe and palatable. The soldier or traveller can thus protect himself if, whenever he replenishes his water-bottle at the wayside, he adds one of these tablets at the same time.

Water as a *curative agent* is largely used both internally and externally. Externally, it is chiefly useful as a means of applying heat or cold (see *Baths*). Internally, pure water is a valuable stimulant to the process of excretion; it is the safest diuretic we possess, and is thus largely used in the treatment of gout and of renal disease. The effect of water on the various parts of the body differs according to the time of day it is taken; thus (1) taken on rising, a glass of cold water acts as a laxative; (2) sipped before meals it stimulates digestion, especially if taken hot, and is thus useful in many cases of dyspepsia; (3) taken copiously with meals, however, it retards digestion by diluting the gastric juice. Aërated water is more palatable than pure water to many people, and may be used in the same way. Medicinal waters are largely used in the treatment of disease, in some of which the water itself is the most valuable part of the treatment; they are best taken at the Spas under medical supervision [see *Health Resorts*].

WATER-BED and Water Cushions are alike valuable to relieve pressure when there is risk of bed-sores forming. A water-bed must be placed on the bed empty, and then filled with warm water, a task which requires an hour's hard work and many gallons of hot water to accomplish. The bed should be filled three-quarters full of water and a little air should be pumped in with a bicycle pump. Care must be taken that the edges of the water-bed do not press on the back or the heels of the patient, and that safety pins are not inserted into it, which is apt to happen when dressings are being changed. If such an accident has happened, the "repair outfit" for punctures of a bicycle tyre will be found useful. The water-bed should in all cases be covered by the usual blanket, sheet, and draw-sheet; it must not come in contact with the skin.

WATER-BRASH, or **PYROSIS**, is the term applied to the bringing up of clear fluid into the mouth. Such fluid may be acid, bitter, or tasteless, and is a symptom of indigestion. A saltspoonful of bicarbonate of soda in half a tumbler of water may be taken, and the cause of the indigestion, which is often an excess of sweet or starchy food, should be avoided in future.

WATER ON THE BRAIN. See *Brain*.

WATER-CLOSET must be of such a pattern that it is (1) always clean, (2) efficiently trapped, (3) without direct connection with the drinking water cistern, and (4) flushed by a special cistern of its own, which should hold from two to three gallons. The "wash-out" closet and the "valve" closet are two of the best patterns in use at present; a "hopper" closet is commonly used, and it is satisfactory if a short hopper is used; the long hopper is to be condemned from its lack of cleanliness. The "pan" closet is another variety that should be condemned. The traps must be furnished with anti-siphonage pipes to prevent them becoming unsealed [Refer to *Traps, Drains*].

WAX IN EAR. See *Deafness, Ear*.

WEAKNESS. See *Debility*.

WEANING. See *Infancy*.

WEIGHTS AND MEASURES. The avoirdupois system is employed in the most recent edition of the Pharmacopœia, published in 1898.

437 grains = 1 ounce.
16 ounces = 1 lb.
7,000 grains = 1 lb.

Comparing the avoirdupois with the metric system we find:—

1 gramme = 15.4 grains.
1 grain = .065 grammes.
1 ounce = 28.35 grammes.
1 pound = 453.6 grammes.

Formerly the scruple and the drachm were recognised weights weighing 20 and 60 grains respectively, but they are excluded in the present Pharmacopœia.

The volume of an ounce of distilled water at 62° F. is the standard measure, and is termed a fluid ounce.

60 minims (or drops) = 1 fluid drachm (a teaspoonful).
480 minims or 8 fluid drachms = 1 fluid ounce (2 tablespoonfuls).
20 fluid ounces = 1 imperial pint.

It is often convenient to regard 5 grains dissolved in a fluid ounce as a one per cent. solution.

Comparing the measures of the Pharmacopœia with the metric system:—

1 minim = .059 cubic centimetres.
1 fluid drachm = 3.55 cubic centimetres.
1 fluid ounce = 28.4 cubic centimetres.

Roughly speaking, a litre, which is 1,000 cubic centimetres, is $1\frac{3}{4}$ pints.

WEIR-MITCHELL TREATMENT is a system of treatment named after an American doctor who introduced it. The patient is put to bed, isolated from all friends, thoroughly massaged twice daily, and given from three to five pints of milk daily in addition to three good meals of other food. The treatment is usually persevered in for at least a month, and is useful in cases of hysteria, nervous prostration, insomnia, and similar conditions, especially when accompanied by loss of weight.

WELLS. See *Water*.

WEN. See *Sebaceous Cyst*.

WET-PACK. See *Baths*.

WETTING THE BED. See *Bladder*.

WHEY. See *Milk*.

WHISKY is a form of spirit, containing about 50 per cent. of alcohol. It should be prepared from malt by distillation, and coloured by storing it in barrels that have contained sherry. At the present day a great deal of "whisky" is prepared from grain which has not been first malted, and is put on the market without this fact being in any way indicated on the bottle. Such whisky, often sold as blended whisky, lacks many of the ingredients present in true malt whisky and contains others which are harmful. New whisky always contains fusel oil, an impurity which is harmful and highly intoxicating. In the process of maturing this disappears. Whisky, if of a good brand, is one of the best forms of alcohol we have, though taken neat or on an empty stomach it is of course bad, and will in time give rise to a hob-nailed liver; it is far less prone to cause gout than beer or port wine, and it also less often causes delirium tremens than brandy does, thus showing it is less poisonous to the nervous system.

WHITE-SWELLING is a term used to indicate tuberculosis of a joint (see *Tuberculosis, Joints*].

WHITLOW is an abscess or gathering in a finger or thumb. The danger of this condition lies in the risk that the matter may travel up the finger to the wrist, hence the doctor should be called in promptly, and the matter let out as soon as it has formed; the severe pain is thus promptly relieved. Until the abscess is opened, it should be poulticed with a linseed poultice, which retains the heat longer than a fomentation, and which should be renewed as soon as it is cold. The poultice should be covered in oil-silk and some wool and a bandage. The hand should then be slung up on to the opposite shoulder, as in this position there is less throbbing. The diet should be light but nourishing, and any tendency to constipation that may be present should receive attention.

WHOOPING COUGH is an infectious disease usually attacking childhood, and characterised by a distinctive cough. The symptoms for the first ten days consist of a feverish cold which presents nothing distinctive; the case is highly infectious, unfortunately, during this stage. After ten days to a fortnight the cough assumes its typical character, which consists of a series of short coughs without any breath being taken between them, until finally air is drawn into the lungs with a "whooping" sound, frequently vomiting then follows. At the onset the child is often frightened and runs to its nurse, clutching hold of her dress, and during the attack the face often turns blue, the eyes start, and the child looks suffocating. The complications are convulsions, broncho-pneumonia, and wasting from the frequent vomitings. The after-effects include the risk of tuberculosis. The duration of the attack varies, but six weeks is an average time. Infection continues until the whoop ceases. The *treatment* should be confinement to bed, in the early stages, in a well-ventilated room, and strict isolation from all children. The diet should be light, and later, when vomiting is frequent, food should be given directly after it is vomited. No medicine should be given, except by medical orders; no drug is known that has an undoubted beneficial effect, though numbers of patent ones are on the market. During convalescence, a seaside holiday is very desirable [For the incubation and quarantine periods, see the table given under *Fevers*].

WINDPIPE, or **TRACHEA,** puts the throat in communication with the bronchi. [See *Tracheotomy, Lung*].

WINE is the fermented juice of the grape. In red wines the skin has been allowed to remain in the juice while fermenting. This gives not only the red colour, but it adds tannin, which is astringent. White wine is free from both the colour and the tannin, and is in consequence less likely to upset digestion. Wines in which all the sugar has been changed to alcohol before bottling are dry wines, those in which the fermentation proceeds after bottling are effervescing wines, like champagne. Sweet wines which are not effervescing have been doctored, that is, the fermentation has been stopped by adding raw spirits. The bouquet or aroma of a wine is caused by the compound ethers the wine contains. It is these which develop as the wine matures, and it is these far more than the alcohol which cause gout. Hence the gouty often do well, if they drink wine at all, to use a claret or hock that is not too old.

Wines may be classified thus, according to Sir A. Garrod:—

(1) Spirituous wines, rich in alcohol and sugar. These are port, sherry, madeira, marsala, containing about 15 per cent. of alcohol.

(2) Liqueur wines, rich in sugar, alcohol between 10 and 15 per cent. These include Tokay and Malaga.

(3) Acid wines, rich in acid tartrate of potash; alcohol about 10 per cent. The red wines, with tannin, include Claret, Bordeaux, and Burgundy. The white wines, without tannin, include Hock, Moselle, and Chablis.

(4) Sparkling wines, rich in sugar and carbonic acid, include Champagne and sparkling Hock.

Much of the port and sherry on the market is sham wine made of crude spirit coloured and sweetened. For invalid purposes we urge the use of the light white wines, and when a strong stimulant is required, the use of good brandy or whisky rather than port.

WOOLSORTER'S DISEASE is a form of *Anthrax*. [See *Dangerous Trades*].

WORMS. A great number of species in this group of animals lead a parasitic life, that is to say, they live in the body of some other animal, usually a vertebrate, which is technically known as the "host." Forty-seven species are known to infest man, though, fortunately, the majority of these are rare. Those worms which in structure are specially adapted to a parasitic existence often pass their life in two hosts, the earlier stages of development being passed in one host whilst the mature worm lives in another of an entirely different species. For instance, the pork tape worm in its immature condition lives in the muscles of the pig, and only develops into the mature

worm when the pig's flesh, in an imperfectly cooked state, is consumed by a human being. The mature tape worm does not attack the muscles of its human host, but attaches itself to the intestinal wall by means of four suckers with which its head is provided, and the worm then remains stationary within the small intestine, absorbing the nourishment with which it is bathed, and discharging eggs in countless thousands. The eggs do not develop unless, after their expulsion from the intestine of their human host, they contaminate the food of a pig, and so gain access to its stomach, within which they hatch; the young worms thus set free bore their way into the stomach wall and finally reach the muscles where they remain quiescent until consumed by man. In another species, the *Tænia echinococcus*, the adult worm lives in the intestine of the dog, and the immature worm infests the liver, lungs, or other parts of the body of the ox, sheep, pig, and occasionally of man, giving rise to the tumours known as "hydatid cysts" (see *Hydatid*). It is thus seen that man acts as a host to the adult worm in the former species, but to the immature worm in the latter, and the symptoms produced are naturally very different in the two cases. In other species, one host is a vertebrate and the other an invertebrate, as in the Guinea-worm, the adult of which attacks man, whilst the embryo lives in the water-flea, gaining entrance to the human being in drinking-water.

The chief points concerning the three common parasitic worms met with in Britain may be summarised thus:—

Thread-worm.	Round-worm.	Tape-worm.
APPEARANCE. Not unlike a piece of wet cotton, half-an-inch long.	APPEARANCE. Not unlike the earth-worm in size and shape, but of a dirty white colour and devoid of rings.	APPEARANCE. 6–12 feet long, flat, and segmented, ½ inch broad, tapering towards the head, which is rather larger than a pin's head and is armed with four suckers.
HABITS. In large intestine in large numbers.	HABITS. In small intestine, in comparatively small numbers.	HABITS. In small intestine, rarely more than one.
Active. At night often escapes from anus.	Active. May escape from mouth or nose.	Passive. Fixed by head to intestinal wall; fragments often expelled per anum.
LIFE-HISTORY. Only one host—man. Eggs are discharged in the motions, and some of them may find their way into the human body by polluted drinking-water or water-cress.	LIFE-HISTORY. Only one host—man. Life history, as in the thread-worm.	LIFE-HISTORY. Two hosts—(1) Man, (2) either ox or pig, according to the species of tape-worm. The terminal segments of the adult worm, containing ripe eggs, break off and are discharged per anum. These are harmless to human beings, but develop if swallowed by the ox or pig, the flesh of which is then liable to convey the worm to the human intestine.
PRECAUTIONS. Water from an unreliable source should be filtered or boiled; water-cress is best avoided. When worms are present fresh crops of them are frequently induced by carelessness in regard to the finger-nails.	PRECAUTIONS. Treat water as for the eggs of thread-worm.	PRECAUTIONS. Meat infested with tape-worm, viz., *measly meat*, must not be eaten, as even if cooked, all the worms are not killed. Oxen and swine must be so fed as to avoid infection.
SYMPTOMS. Often slight. Local irritation, incontinence of urine, diarrhœa, disturbed sleep, and at times convulsions. (It is a popular error to put every childish ailment down to "worms," and be it noted that irritation about the nose is usually due to some other cause).	SYMPTOMS. Usually none. Rarely a worm may make its way into the nose, or bile duct, and produce symptoms accordingly.	SYMPTOMS. Generally severe. Hunger and emaciation due to the nutriment absorbed by the parasite.
DIAGNOSIS. Only to be made if worms are found in the bed or the motions.	DIAGNOSIS. Only made when the worm is discharged.	DIAGNOSIS. Made by the appearance of fragments of the worm, per anum.
TREATMENT. (1) Avoid patent "worm powders." (2) Prevent scratching during sleeping, enclosing each hand in a sock that is tied around the wrist. (3) Smear the skin around the anus with white precipitate ointment. (4) Give enemata of salt water or quassia daily for ten days. (See *Enemata*).	TREATMENT. Santonin, given under medical supervision.	TREATMENT. Pumpkin seeds three ounces, crushed and soaked in water for twelve hours, should be taken on an empty stomach and a purge an hour later. Unless the head comes away the parasite will grow again. Under medical supervision male fern is often efficient.

Certain other worms are worthy of mention. The *Trichina spiralis* gives rise to a disease in man termed *trichiniasis*, the symptoms of which resemble those of typhoid fever. The immature worm lives in the muscles of the pig. When pork, infested in this way, is eaten without having been very thoroughly cooked, the worms grow, and within a week each produces hundreds of young, which bore through the wall of the intestines and make their way into all parts of the body. This migration is accompanied by fever, diarrhœa, and pains in the limbs, which last till the migration is over, usually for a month or so. When the worms have settled down in the muscles they cause no further symptoms. The worms survive in swine flesh for a considerable time after the pig is slaughtered, and they even withstand the process of smoking by which ham is made. Raw ham is thus liable to spread the disease, and, as a matter of fact, the disease is prevalent only in districts where sausages made of raw ham are largely eaten, as in North Germany and in the German quarters of American towns. The Germans have largely reduced the prevalence of the disease by a thorough system of meat inspection, and by attention to the way in which

swine are housed and fed. The normal life history of the worm is to use the pig and the rat as a host alternately, infection of man being only an accidental occurrence.

The tunnel worm, *Anchylostomum duodenale*, lives in the small intestine in large numbers and feeds on blood sucked from the intestinal wall. The symptoms produced are a severe anæmia known as Miner's Anæmia or Egyptian Chlorosis. The disease is prevalent amongst miners and others, especially in Egypt and Brazil. It caused serious consequences to many of the men engaged on the St. Gothard tunnel, and it has appeared recently amongst the Cornish miners. The worm gains entrance to the body in drinking water contaminated with sewage.

Bilharzia haematobia is common in Egypt and at the Cape. It caused serious illness in Napoleon's Egyptian campaign, but the cause was not then recognised. It attacks the male population much more often than the female, and in the Transvaal is remarkably prevalent amongst the Boers.

WOUND is popularly understood to mean a breach in the skin, with or without injury to the underlying tissues, produced by violence. In Law, a wound is a wider term; thus a man who breaks another's leg "wounds" him even though the skin is not broken. In Medicine, wound is used in its popular sense. Five varieties are recognised, viz., incised, punctured, stab, lacerated, and contused wounds. An incised wound is one made by a cutting instrument; a punctured wound is one made by the thrust of a pointed instrument devoid of cutting edges, e.g. a nail; a stab is produced by a pointed instrument with cutting edges, e.g. a dagger, and the wound thus produced is really a combination of a punctured and an incised wound; a lacerated wound is one produced by tearing—a common result of machinery accidents; a contused wound is one in which the tissues have been smashed by a blow, as in a fall or the blow of a hammer.

The HEALING OF WOUNDS is favoured by attention to the following five rules:—(1) Arrest bleeding, (2) cleanse the wound, (3) bring the cut edges together when this can be done with safety, (4) provide for the escape of discharges, (5) keep the injured part at rest.

The first of these rules is discussed under *Hæmorrhage* (see *First Aid*). The cleansing mentioned in the second rule is necessary, because germs are the chief cause of wounds not healing. It should be carried out by syringing the wound or immersing it in a mild antiseptic lotion. (The choice of an antiseptic is discussed under *Disinfection*.) With respect to the third rule, the question whether to bring the cut edges together or not is often difficult to answer. When in doubt, it is better to leave the wound open. In punctures, closure of the wound is certainly the worst treatment possible, and in lacerated and contused wounds, it had better never be attempted by the layman. In clean cuts, however, the edges should be brought together, preferably by the stitches of the surgeon, but failing a surgeon, resort must be made to collodion, Friar's balsam, or strapping; it is doubtful, however, if the use of collodion or Friar's balsam is safe in lay hands, as it is essential that only cuts that are entirely cleansed from germs should be treated with either of these remedies.

(1) *Collodion* is best applied on cyanide gauze, in the following way. Several layers of gauze should be cut, rather larger than the wound. The cut having been cleansed and all bleeding arrested, the surrounding skin must be thoroughly dried or the collodion will not adhere to it. The gauze should then be dipped in the collodion and applied to the wound, layer by layer, as any attempt to apply several layers at once will not prove satisfactory. In drying, the collodion contracts and draws the edges of the cut together, and at the same time forms a protective coating over it. This method is well adapted to small, clean cuts.

(2) *Friar's Balsam* is not so good, though it may be applied if necessary either in the same way as collodion or by simply pouring it over the cut, provided the cut is thoroughly cleansed first and then dried.

(3) *Strapping* may be used to draw the edges of a longer cut together, though it is very inferior to surgical stitches. The best material is either rubber-strapping or Leslie's hospital strapping. A dry dressing just wide enough to cover the cut should be applied first, and over these, strips of strapping should be applied in pairs, each pair making a cross, the centre of which is over the wound. The strapping must first be heated by wrapping it round a metal jug of hot water with the sticky side outwards. The lowest corner of the wound should not be covered by strapping, so as to enable any discharge that may form to escape. Over the strapping a pad of wool is placed, which is secured by a bandage, and the dressing is then complete.

When it is decided not to bring the edges of the wound together, a dry dressing should be applied, unless there is a large raw surface, as in the case of many burns, when vaseline or eucalyptus ointment spread on lint or clean linen is preferable. The dry dressing should be impregnated with antiseptics; boric lint or cyanide gauze are two of the best preparations, but when these are not obtainable, clean linen rag may be used and the antiseptic provided by dusting the wound with boric powder. A pad of sterilized absorbent wool should be placed over the dry dressing, and the whole enclosed with a bandage. Rest must then be secured for the injured part by the use of splints, slings, or by confinement to bed.

THE AFTER-TREATMENT. Clean cuts should be left alone after the first dressing for a fortnight, when the dressing should be removed, and the wound be found to have healed. Wounds, the edges of which have not been brought together, should be dressed daily; the wound should be syringed with a mild antiseptic at blood heat, and then bandaged up as before. The bandage and wool, if not soiled, may be used again, but the dressing in contact with the wound should be renewed daily.

The indications for departure from the above procedure are:—

(1) The *appearance of blood or discharge* on the bandage, which demands immediate removal of the dressing and an inspection of the wound. If bleeding is going on it must be arrested (See *First Aid*); if the discharge is copious the dressing must be renewed each time it soaks through, without delay.

(2) The *occurrence of pain* or throbbing, accompanied by a rise of temperature. These symptoms are likely to occur on the third day, if the wound has not been properly treated or was much bruised in the first place. They indicate that the wound is poisoned by the invasion of germs, which have caused the formation of matter, or as it is termed, pus. If the germs had been excluded, pus would not have formed, and if the pus is not allowed free means of escape it will cause blood-poisoning. In this case the dressings must be removed, when the wound will be seen to be "angry," that is, inflamed. Any strapping present should be removed and the wound should be opened up at its lower corner, and after being thoroughly bathed in a mild, warm antiseptic it should be treated with boracic fomentations every few hours until the inflammation has subsided, when the dry dressing may be resumed. [See *Fomentation*.]

N.B.—When the wound consists of a large raw surface and makes but little progress, stimulating ointments may be applied as directed under *Ulcer*.

THE TREATMENT OF SPECIAL CASES: (1) Wounds of *mucous membrane*, e.g. a wound in the mouth, should be treated, after the bleeding is checked, with mild antiseptics used as a gargle or spray. For this purpose Condy's fluid answers well, and such wounds usually heal readily. (2) Wounds due to a *foreign body* imbedded in the flesh, such as gunshot wounds or needles in the hand, should be bandaged up and a doctor sent for. When there is no chance of medical aid, the wound should be fomented until it heals or the foreign body is discharged, and meanwhile the wounded part must be kept at rest, which is best secured in the case of a limb by the use of a splint.

A *fish-hook* may need extraction. This is best accomplished by cutting off the dressing, so as to leave the shank bare, and pushing the hook steadily onward through the flesh till the point appears and can be seized with pincers. The hook is then readily withdrawn if the shank be first snipped off close to the skin; or it may be pushed on till the barb appears, which is then cut off and the hook withdrawn.

(3) Wounds with *flaps of skin* hanging by a small portion. The wound should be cleansed and the flaps replaced, as the probability is that the latter will live. (4) Wounds caused by *bites*. (See *Bites* and *Snake-bite*.) The material

for dressing wounds, which should be kept handy by those living far from a doctor, include :—

> Some antiseptic, e.g. Sanitas, Chinosol, Jeyes', Condy's fluid, etc., boric powder, boric ointment or eucalyptus ointment or vaseline, collodion and a paint brush for it, scissors, dressing forceps, safety pins, bandages of sizes to suit the finger, arm, and chest, sterilised absorbent wool, cyanide gauze, boric lint, plain lint, oil-silk or christia tissue.

The dressings should be bought sterilised and kept in an air-tight tin. They may be sterilised again at any time by placing them in an air-tight tin in a brisk oven for half an hour. Those who live within easy reach of medical aid may, nevertheless, find the following useful at times : A little cyanide gauze and collodion for clean cuts ; some antiseptic, some boric lint, christia tissue, absorbent wool, and a few bandages.

WRIST-DROP, a symptom of lead poisoning. [See *Dangerous Trades.*]

WRITER'S CRAMP is a condition in which the writer gradually loses control of his pen, until he cannot write at all. The sufferer is usually a clerk or professional writer of some kind, those engaged in copper-plate work being specially liable. The symptoms begin with aching of the hand after writing for the usual time, in a few weeks to this symptom is added unsteadiness, which is usually remedied at first by grasping the pen more tightly ; later the pen is unsteady, however tightly it is held, and finally cannot be grasped at all in spite of the fact that for all other movements the hand is as useful as ever. The *treatment* should be rest in the early stages, and the use of a soft broad nib or pencil for such writing as is performed. Still better is the use of a type-writer of the piano-playing variety, and the abolition of all writing for some months. Massage and galvanism are also useful. Similar "occupation-cramps" attack, though more rarely, the members of other occupations, as in violin playing, hammering, and even milking. In all cases rest of the muscles involved is imperative.

WRY-NECK is a twisting of the neck to one side. It may date from birth, but more commonly develops later. Chill may cause muscular rheumatism on one side of the neck, producing the well-known "stiff neck" ; more rarely the wry-neck is due to spinal disease. A still rarer form of wry-neck is spasmodic wry-neck, a disease of middle age characterised by intermittent spasm of the muscles of one side, which forcibly draw the shoulder up and the back of the head down, till they nearly meet, whilst the chin is thrust to the opposite side. Like many spasmodic affections it is made worse by the presence of strangers, and ceases during sleep. The treatment should be in medical hands [Refer to *Stiff Neck*].

X RAYS, or **RÖNTGEN RAYS**, are now extensively used both in diagnosis and treatment. They are of great service, not only in the diagnosis of fractures, but also in detecting stone in the kidney, for seeing the part of the lung attacked by consumption, for detecting aneurysm, for examining diseased joints, and for the localisation of bullets and needles that are buried in the flesh. In nearly all cases of fracture or of injury to a limb near a joint, it is well worth resorting to the X rays before any active treatment is adopted. In the same way, a needle buried in the hand or foot may require very prolonged dissection to extract, unless the exact position be first determined by means of the X rays. Mr. Hurry Fenwick, in the Medical Annual for 1903, urges the importance of having any child examined by the X rays who suffers from recurrent attacks of severe stomach-ache. For in such a case stone in the kidney may be detected, which, according to this authority, is a more frequent cause of "stomach-ache" than is commonly thought. In the detection of early consumption, it is noteworthy that not only is the affected portion of the lung more opaque than normal, but the diaphragm on the affected side moves less ; and the latter sign is now regarded as important.

The use of the X rays in treatment is restricted mainly to the cure of rodent ulcer and lupus. For advanced rodent ulcer with much ulceration no treatment is equal to the X rays, though for the early stages excision or the Finsen light seems preferable. The healthy part of the face is protected from the action of the rays by tinfoil or preferably sheet lead, and a hole is punched in the lead at a point corresponding to the ulcer. The treatment has usually to be repeated over many months, though cures in less than twelve sittings have been reported. In the treatment of lupus, the X rays have now largely supplanted the Finsen light method, as the latter takes so much longer to act ; the scar, however, ultimately produced by the latter is said to be better than that resulting from the former.

Such active rays naturally have their *dangers*. Cases of severe burns have occurred from the carelessness or ignorance of those who have worked with them. Hence their use should be confined to thoroughly trained experts. The repeated exposure of the hand to the X rays merely to show the bones of the hand for the amusement of others at a conversazione or the like, is not justifiable, an acute inflammation of the skin may be thus caused. Many experts have found to their cost, that the repeated exposure to X rays has caused in themselves a chronic inflammation of the skin of the hands, with the formation of corns and painful cracks, that are most difficult to heal, and in a few cases, inflammation of the inner surface of the eye-lids has also been reported. For an acute inflammation, the application of lead lotion is recommended by Dr. Hall Edwards, and for the chronic condition, an ointment, composed of salicylic acid and menthol of each gr. 20, cocaine, gr. 1, and lanoline an ounce, has been found a useful application, whilst exposure of the injured parts to X rays or bright sunlight has to be rigidly avoided. The use of india-rubber gloves, whilst working with X rays, is a valuable preventive measure (see the *British Medical Journal* of October 15th, 1904).

YAWNING is a curious act, the purpose of which is not clear. It is readily induced by a condition of ennui or by the sight of another person yawning. It is not produced merely by fatigue ; for instance, it is far more common during listening to a prosy speech, even for a few minutes, than it is at the end of a long day's walk or after a football match. Although more common perhaps in a stuffy room, it is not one of the regular symptoms of commencing asphyxia. When present to a marked extent, yawning may indicate the presence of anæmia, or nervous exhaustion. [See *Anæmia, Debility.*]

YEAST was at one time a fashionable domestic remedy for boils, but it is now superseded by more efficient remedies. It is possible that the phosphate it contains has some value as a tonic.

YELLOW FEVER is an infectious disease characterised by jaundice, hæmorrhages, and an elevation of temperature. The actual parasite which causes it is not yet known, but it is clear that mosquitoes can convey the disease just as they convey malaria from the sick to the healthy. The mosquito concerned is *Stegomyia fasciata*, which is one of the commonest species met with between the 30th parallels. Its grubs breed in water tubs and cess-pools around the houses. Attention to this fact has had an excellent result. In Havana the draining of all yards, the covering of all exposed water near the house with oil, and the use of mosquito nets has resulted in the stamping out of yellow fever in that town ten months later. Until these precautions were taken in 1901, yellow fever had never been absent from Havana for 140 years at least (see Colonial Medical Reports for 1901 and 1902). Yellow fever has its home in the West Indies and the West Coast of Africa, whence it is at times conveyed by shipping to distant ports.

ZYMOTIC DISEASE. See *Fevers.*

PREFACE.

TO this section of the book we must give a prefatory word as to its object and scope. It consists of four distinct parts. The first part, on "Parliament and Administrative Government" will we hope prove interesting to every Briton who values the political institutions of his country. The second part, on "Local Government" will provide the public-spirited citizen, who wishes to render service as a County or Borough Councillor, or in some similar capacity, with the legal knowledge that is essential to him as a guide in the performance of his public duties. The third part, on the "General Principles and Practice of English Law," will not only serve for occasional reference on the part of the general reader, but will at the same time serve as a guide to any one who desires to study the broad lines of English law. The fourth part, on "Commercial Law," will supply information that is quite indispensable to the merchant, tradesman and others engaged in commercial business.

Whilst venturing to hope that the brief account of the laws of England here given will serve a useful purpose as a general guide in the ordinary run of business and practical life in which law enters as an important factor, we do not pretend that it will enable any one to dispense with the services of a lawyer, when it is thought expedient to bring the matter in dispute into a law court. It may, however, help to discourage a hasty recourse to litigation by giving a man a just view of the rights and liabilities of each party in the dispute, and by impressing him with the existence of the many hidden pit-falls into which the unwise litigant is in danger of falling. In fact, this little treatise on the law aims not at helping a man through the law courts without professional assistance, but rather at keeping him outside altogether when his case is of doubtful issue. Though it would be unwise for a man to presume upon his slight knowledge of the law to judge for himself whether or not his case is strong enough to bring into court, and still more unwise, if brought there, for him to dispense with professional aid in conducting his case, yet he might find his "little learning," instead of being "a dangerous thing," of great service in helping him rightly to appreciate the argument of his lawyer and the soundness of his advice when consulted about the expediency of "going to law."

The arrangement aimed at is one that will make reference easy, and present on each important subject the main points in one view. The attempt to attain the latter object has entailed a certain amount of repetition, but in this way has been avoided the necessity of much cross reference. Many subjects, however, have been treated in different connections, and in various aspects, and therefore in different parts of the book. When, then, further information on a subject is desired reference should be made to that subject in the Index, where will be found the different places in which it occurs.

A LEGAL GUIDE.

PART I.

PARLIAMENT AND ADMINISTRATIVE GOVERNMENT.

INTRODUCTORY.

It is often stated that the government of this country is a limited monarchy, or that the British nation is ruled by a sovereign with limited powers. This popular notion is incorrect. In reality the country is governed by a sovereign Parliament, consisting of three interdependent parts—the Crown, the Lords, and the Commons. From a legal point of view, it should be remembered, Parliament includes the King as well as the two houses.

Parliament is the supreme, but not the only law-making body in this country. It has the right to make or to unmake any law whatever, and no person or body of persons in this country has a right to over-ride or to set aside or to dispute the validity of laws made by Parliament. In this respect Parliament differs from nearly every other legislature on the face of the earth. Yet when it is said that Parliament is a sovereign law-making body, and has power to make or unmake any law it pleases, this must not be taken to mean that there are not *any* limitations on the authority of Parliament. What is meant is that there are no legal limitations on the power of Parliament, that there is no law and no person which can call in question the authority or the validity of Acts of Parliament. Nevertheless, there are real limitations to its power. Parliament must legislate in harmony with the wishes and the opinions of the people. No law passed by Parliament could be enforced if it outraged the beliefs or the conscience of the majority of the people in this country. If Parliament were to pass such a law, there would be a conflict between Parliament, the legal sovereign, and the electors, the political sovereign, and of the issue of such a conflict there can be no doubt.

As will be seen later, the King has certain rights, powers, and prerogatives which enable him to do certain things without the concurrence of the Lords and Commons. These rights are the survival of a time when England was under the rule of an absolute monarchy and not of a sovereign Parliament. The constitution has developed gradually during the last seven centuries and in the course of its development certain prerogatives have been wisely left to the Crown, prerogatives that could not now be constitutionally abrogated without the king's consent.

Although the powers inherent in Parliament include not only the legislative but also the executive and administrative functions of government, it has been found convenient in practice to delegate the executive and administrative government of the country to other bodies (e.g., the Departments of State, and the Courts of Law) which are all subordinate to, and for the most part derive their authority from, the sovereign Parliament. In the pages that follow it is proposed to deal with the legislative, executive, and administrative machinery of government, and more particularly with the personnel of the various departments.

THE CROWN.

TITLE TO THE THRONE. In Early English History the occupant of the throne was elected by the Witenagemot, a council of the chief men of the nation. Gradually, however, the title by election was supplanted by that of inheritance, due regard being paid to the rules of primogeniture. But often, as in the case of many of the Yorkist and Lancastrian kings, the right to the throne was merely a right gained by might and conquest; and sometimes, as in the case of William III. and Mary, the sovereign was chosen by the representatives of the people in Parliament assembled. Now, however, the title of the sovereign to the throne dates from the Act of Settlement, 1701, which provided that on the death of William III. and Queen Anne without issue the next in the order of succession should be Sophia, the Electress of Hanover (grand-daughter of James I.) and the heirs of her body, being Protestants. On the death of Queen Anne, George I., the son of the Electress of Hanover, succeeded to the throne and his descendants have since continued to occupy it. The occupant of the throne must be a Protestant, and may be either a male or a female, though among brothers and sisters of the royal family each brother's title to the crown is held superior to that of any sister. In fact, the heir to the throne succeeds much in the same way as an ordinary heir-at-law, except that females do not hold the title in coparcenary. (Refer to "Coparcenary" in *Index*).

ACCESSION. By various statutes it has been enacted that no office under the Crown shall become vacant by reason of a demise of the Crown; but that the holders of such offices are to continue in their duties for six months unless before that time they have been confirmed in, or removed from, their respective appointments. When a sovereign dies it is customary on the following day for his successor to be publicly proclaimed in a Proclamation issued by the Lords Spiritual and Temporal, assisted by members of the Privy Council, members of the Royal Family, the Lord Mayor and Aldermen of London and other important personages. The new sovereign then takes and subscribes the oath relating to the security of the Church of Scotland which is required by the Act of Union. He then usually issues a proclamation confirming the holders of offices in their appointments. Such a proclamation was issued by King Edward VII., but in future it will probably be dispensed with owing to the provisions of the Demise of the Crown Act, 1901. About a year afterwards when the Court has emerged from mourning the coronation takes place.

CORONATION. This is a religious ceremony which, in the days when kings were elected, showed the sanction of the Church to the choice of the Witenagemot. The coronation also confirms the sovereign in his position of supreme head of the Church of England and Defender of the National Faith. The ceremony is full of symbolism and takes place in Westminster Abbey in the presence of the Peers and persons of distinction. The principal portions of the service consist in

(1) The *Recognition* whereby the new sovereign is publicly presented to the people.

(2) The *Oaths* whereby he promises to govern according to the statutes, laws and customs of the country and to maintain the established religion.

(3) The *Anointing* with oil whilst seated in the chair which is said to have been used in the coronation of Edward the Confessor.

(4) The *Investiture*, whereby he is invested with a royal robe, a ring, an orb and other symbolical appointments.

(5) The *Coronation* or the crowning of the King by the Archbishop of Canterbury.

(6) The *Homage* whereby the Peers of the realm swear fealty.

THE CIVIL LIST. Originally the expenses of our sovereigns were paid from what were called the "Hereditary Revenues of the Crown," which consisted of the rents of Crown lands supplemented by certain taxes and excise duties voted by Parliament for that purpose. Now, however, it has become the custom for each successive sovereign to surrender his hereditary revenues to the Commons in exchange for a Civil List paid from the ordinary taxation of the nation. In accordance with this custom His Majesty King Edward VII. placed unreservedly his hereditary revenues at the disposal of the Commons, who by the Civil List Act, 1901, directed them to be paid into the Exechequer and made part of the Consolidated Fund. In return the Commons directed that the King's Civil List should be £470,000 annually; and that in addition annuities should be granted of £20,000 to the Prince of Wales, £10,000 to the Princess of Wales, and £18,000 to Trustees for the three daughters of his Majesty. The Duke of Connaught receives an annuity of £25,000 and His Majesty's sisters receive £6000 a year each. (Refer to "Duchy of Lancaster" and "Duchy of Cornwall" in *Index*).

The King's Civil List of £470,000 is made up as follows:—

		£
(1)	Their Majesties' Privy Purse	110,000
(2)	Salaries of His Majesty's Household and retired allowances	125,800
(3)	Expenses of His Majesty's Household ..	193,000
(4)	Works	20,000
(5)	Royal bounty, alms and special services	13,200
(6)	Unappropriated	8,000
	Total	£470,000

THE ROYAL FAMILY. The family of a sovereign has no place strictly speaking in our Constitution, neither do its members take any part in the political government of the country. When a Queen Regnant marries, her consort takes no part in the government of the State but the offspring of the marriage are nevertheless considered to be members of his House or Family; so that our present sovereign belongs to the House of Coburg.

The present Royal Family consists of the descendants and first cousins of Queen Victoria and their respective consorts. By the Royal Marriages Act, 1772, no descendant of George II. other than the issue of princesses married into foreign families may marry without the previous consent of the sovereign; and if they marry without such consent the marriage will be void, except where the descendant, being over twenty-five years of age, has given twelve months' notice to the Privy Council of his intention to marry without the sovereign's consent. If during the twelve months both Houses of Parliament have not expressly declared their disapprobation of the intended marriage, it may take place and will be perfectly valid, save that the sovereign is not bound to accord any rank, precedence, or royal recognition on a person who has thus married a member of the Royal Family.

Members of the Royal Family are addressed as His (or Her) Royal Highness. The male members on attaining years of discretion are usually made dukes, but they do not, of course, thereupon cease to be Princes, by which title they were previously styled. The Consort of a King bears the title of Queen and has her own Household, though she takes no part in the government of the country. She however, is crowned by the Archbishop of York at the Coronation, and usually accompanies the King at the opening of Parliament and other functions. But the consort of a Queen Regnant is not called King. Queen Victoria conferred upon her husband Prince Albert the title of Prince Consort with precedence next to the Queen by Letters Patent in the exercise of her Royal Prerogative. The eldest son of the sovereign is always Duke of Cornwall and usually has the additional titles of Prince of Wales and Duke of Chester, or Duke of York, conferred upon him by Letters Patent. The eldest daughter of a sovereign is styled the Princess Royal.

ROYAL PREROGATIVES.

1. MAKING TREATIES. The right of making treaties with Foreign Sovereigns and States is a prerogative of the Crown. Being a royal prerogative it is not necessary for any treaty made in this country to be submitted to and confirmed by the Upper and Lower Houses of Parliament. In this respect Great Britain differs from the United States of America and some other countries. In practice, however, the King never makes any treaty except on the advice of his ministers, and as the latter are subject to Parliamentary control, the country's interests are fully safeguarded against any abuse of this prerogative.

2. DECLARATION OF WAR. The Crown has also the prerogative right of making war on Foreign States. Here again, however, the Crown does not now act except through the instrumentality of its ministers, who are responsible to Parliament, and who may be impeached if they give wrong advice. And as the purse-strings are in the hands of "His Majesty's faithful Commons," there is no danger whatever of any war ever being undertaken without Parliamentary sanction and control.

3. TITLES AND HONOURS. The Crown as the "Fountain of Honour" has the prerogative right of creating peers and regulating the order of precedence. It confers the order of knighthood and the various other orders and titles upon its distinguished servants. So also it appoints the Judges who administer our law, and grants commissions to officers in His Majesty's forces. The Crown also, in effect, appoints the bishops; for on a vacancy occurring the King grants to the Dean and Chapter a *congé d'élire*, which is a licence under the Great Seal to elect a person named in certain letters missive which accompany the licence. The Dean and Chapter are practically bound to elect the Crown's nominee.

Although the King's right to confer honours and orders is an absolute prerogative, in practice the appointments are usually made after consultation with his ministers; so that peerages, knighthoods, companionages and other titles of honour are conferred not only on those who have performed some conspicuous service of importance to the nation, but frequently on those who have merely done good service in the interests of the political party which happens to be in power at the time.

4. OWNERSHIP OF LAND. In the eye of the law the King is the ultimate owner of all land in the country. Or, as it is said, "all land is held mediately or immediately from the Crown." So when the owners of land die intestate and without heirs, the Crown succeeds to the property. The Crown as ultimate owner of the soil has also a prerogative right to gold, silver, or other treasure trove found therein, the true owner whereof is unknown and cannot be discovered.

5 THE PREROGATIVE OF PARDON. The Crown as "Fountain of Justice and Mercy" has the right of pardoning persons convicted of crimes—a right, however, that is only exercised upon the advice of the Home Secretary. A pardon may be granted before or after trial and sentence. A free pardon from the Crown is the only way known to the law of releasing an innocent person from prison after a miscarriage of justice. Any compensation granted in such a case is according to our laws, an act of grace, and cannot be demanded as of right. When a sentence of death is commuted to penal servitude for life, it is in form a pardon. A pardon cannot be pleaded to an impeachment (Act of Settlement) nor granted to one who detains a subject outside the realm (Habeas Corpus Act.)

6. **"THE KING CAN DO NO WRONG."** This oft-quoted phrase requires some explanation. If a wrongful act be committed in the name of the King it is assumed that he is not responsible for the deed but his ministers. As the "Fountain of Justice," it is also assumed that no injustice can be laid to his charge. So it is impossible to take any proceedings in our Courts against the King for any crime or tort. If, therefore, property has come into the possession of the Crown which rightly belongs to a subject, the latter can only proceed by way of petition. The person aggrieved draws up a petition which is left at the Home Office for His Majesty's *fiat* (i.e., permission to proceed). In due course, the fiat having been granted, the petition is heard in the High Court of Justice and judgment given upon it in much the same manner as in the case of actions between subject and subject.

THE ROYAL HOUSEHOLD.

The King and the Queen Consort have each a separate household, some of the officials whereof are honorary whilst others are paid out of the Civil List. Most of the minor officials are permanent, but it is a peculiarity of our constitution with regard to the greater officials of the Household, that they go out of office with every change of government and that they are chosen from persons of high rank among the political party which happens at the moment to be in power. This is done to avoid friction between the King and his ministers, the latter of whom might otherwise think that he was wrongly influenced by the persons unfriendly to the ministry in his *entourage*.

PRINCIPAL OFFICIALS OF THE COURT.

1. **THE LORD STEWARD.** He is the chief officer of the royal household. He is a member of the Government and almost invariably a peer of the realm. He presides at the *Board of Green Cloth*, a sort of court which originally had some jurisdiction for the keeping of the peace in the king's palaces and which still deals with all the accounts of the Royal Household. He has the selection and control of all the officers and servants of the household, except those belonging to the Chapel, the Chamber, and the Stable; he also appoints the royal tradesmen. Under him are the *Treasurer* and the *Comptroller* of the Household, who also are members of the ministry.

2. **THE LORD CHAMBERLAIN.** The next great officer of the Household and a member of the ministry is the Lord Chamberlain. He appoints the sovereign's private attendants and manages the ceremonial functions of the Court. It is his duty to see that none but fit and proper persons are permitted to attend these functions or be presented at Court. He has also many other duties not immediately connected with the household. Thus he has to examine and license plays before they can be publicly produced for hire in this country. He is assisted in his household functions by the *Vice-Chamberlain*.

3. **MASTER OF THE HORSE**, the third great officer of the Court, who has the superintendence of the royal stables, with authority over all equerries and grooms, and the appointment of all saddlers and farriers, &c., in the royal service. The office is held in high honour, and its holder rides next to the sovereign on all state occasions.

4. **OTHER OFFICIALS.** There are besides certain other officials who go out of office with the Government, namely, the respective *Captains* of the Gentlemen-at-Arms and the Yeomen of the Guard, and the *Lords-in-Waiting*, whose number is limited to seven, and whose functions are ceremonial, not administrative.

Appended are the salaries of these officials:—

The Lord Steward	£2000	per	annum.
Treasurer of the Household ..	£900	„	„
Comptroller of the Household ..	£900	„	„
The Lord Chamberlain	£2000	„	„
Vice-Chamberlain	£900	„	„
Master of the Horse	£2500	„	„
Lords in Waiting, each	£700	„	„
Captain of the Gentlemen-at-Arms ..	£1200	„	„
Captain of the Yeomen of the Guard	£1200	„	„

5. **PERSONAL APPOINTMENTS.** Besides the ministerial appointments mentioned above, are certain personal appointments made by the King himself, the most important of which are the Master of the Household, the Keeper of the Privy Purse, and the King's Private Secretary.

6. **THE POET LAUREATE**, an official attached to the King's household, was originally called the "King's Versifier." The honour is usually conferred on a poet of some distinction and is held for life. He has no compulsory duties to perform, but he is expected to compose an ode of honour on special state occasions.

GREAT CEREMONIAL OFFICERS.

1. **THE LORD GREAT CHAMBERLAIN.** This official must not be confounded with the Lord Chamberlain mentioned above. His office is hereditary and is claimed by the two families of Cholmondeley and Willoughby de Eresby, it being usual for a member of each family to hold it in turn. He attends the Sovereign at his Coronation and at the opening of Parliament and other similar functions, and it is his duty to see that Westminster Hall and the Houses of Parliament are properly furnished and decorated on great occasions of state.

2. **THE LORD HIGH STEWARD OF ENGLAND.** This official again is not to be confounded with the Lord Steward of the Household. There is no permanent High Steward but the office is revived when occasion requires. He has ceremonial duties to perform at Coronations; but his principal duty is to preside at the trial of Peers. When the proceedings are ended the High Steward snaps his wand of office.

3. **THE LORD HIGH CONSTABLE OF ENGLAND.** This is an official appointed only occasionally for the purpose of assisting at coronations and other like ceremonies.

4. **THE EARL MARSHAL.** This great officer of state is head of the College of Arms which grants coats of arms and crests to those entitled to bear them. The office is hereditary and is held by the Duke of Norfolk. Under him are the three kings of Arms—Garter, Clarencieux, and Norroy—the six heralds of Arms, and the four pursuivants of Arms.

PARLIAMENT.

ORIGIN OF PARLIAMENT. The Great Council of the nation from the time of the Norman Conquest had usually been composed only of barons, bishops, and greater abbots, although on two or three occasions in the 13th century, the smaller vassals of the crown had been represented by two knights from each shire. But in 1265 Simon de Montfort, who at the time was the real ruler of England, though Henry III. was nominally king, not only summoned to his Parliament two knights from each shire but also two burgesses from each chief city and borough. He was thus the first to summon representatives of the towns, and to form a parliament composed, as to-day, of peers, county members, and borough members.

It was not, however, until thirty years later that the practice thus begun was repeated. It was not till 1295 that Edward I. summoned a full parliament, consisting of barons, bishops, knights of the shire, and burgesses (or representatives of the towns), "it being meet," said the king, "that what touches all should be approved by all." This complete form of parliament met with general approval, and from that time parliament assumed its permanent shape. Though the admission of the burgesses and knights of the shire to the assembly of 1295 completed the fabric of our representative constitution, it was only by degrees that the Commons (as the knights and burgesses were styled) established the right not only to take part in matters of taxation—for which they were originally called—but in the work of legislation, and the control of government.

NOTABLE DATES IN PARLIAMENTARY HISTORY.

1265. First Parliament to which were summoned repretatives of the chief towns.
1295. The *Model Parliament*, being the first parliament summoned by royal authority in which the three estates of the realm—the clergy, the nobles, and the commonalty—were represented. All parliaments from this date were composed of these three orders.
1322. Commons obtained recognition of their right to share in all the deliberations of parliament.
1341. Commons sat apart from the Lords, the knights and burgesses sitting as one body. From this date, probably, parliament met as two Houses.
1376. The *Good Parliament* attacked the king's ministers by *impeaching* them before the House of Lords.
1430. Parliamentary elections first regulated by statute, the franchise being secured to all freeholders, whose lands were worth 40s. a year.
1509. Acts of Parliament printed from this time.
1536. Wales, Cheshire, and Monmouthshire now first represented in parliament.
1542. Members protected from arrest for debt.
1614. *The Addled Parliament*, so called because dissolved in anger by James I. without passing a single measure.
1640. *The Short Parliament* met in April and was dissolved in three weeks for discussing grievances instead of voting supplies.
1640. *The Long Parliament* met in November and made war on the king, Charles I.
1648. *The Rump Parliament* composed wholly of *Independents* who put King Charles on his trial, all the other members having been excluded by the act of violence known as "Pride's Purge."
1649. House of Peers abolished but reinstated at the Restoration, 1660.
1653. Cromwell forcibly dismissed the Rump Parliament.
1660. A *Convention Parliament* (that is, one not summoned by royal authority), voted the restoration of Charles II.
1678. Roman Catholics were excluded from parliament.
1689. A *Convention Parliament* offered the crown to William and Mary on condition of their acceptance of the Bill of Rights. From this date Parliament, not the King, the paramount power.
1694. Triennial Act which limited the duration of parliament to three years, security having been already taken for the annual meeting of parliament by making votes of supply for one year only at a time.
1697. Each vote of supply now limited to the service for which it was granted.
1707. First parliament of Great Britain.
[By the Act of Union between England and Scotland it was agreed that the two countries should have a single parliament, Scotland being represented by 16 peers and 45 commoners.]
1716. Septennial Act which extended the maximum duration of parliament from three to seven years.
1771. Reporting the debates in the House of Commons practically permitted, but no "Reporters' Gallery" before 1835.
1801. First Parliament of the United Kingdom of Great Britain and Ireland.
[By the Act of Union between Great Britain and Ireland it was arranged that Ireland should send to the Imperial Parliament 32 peers and at least 100 commoners.]
1801. Clergymen prohibited from becoming members of the House of Commons.
1829. Roman Catholics admitted to parliament.
1832. First Parliamentary Reform Bill passed.
1833. First Quaker admitted as M.P. on his affirmation simply.
1834. Houses of Parliament destroyed by fire.
1835. Separate accommodation for reporters first provided. Previously reporters sat in the Strangers' Gallery.
1840. M.P.'s relinquish the privilege of franking letters (that is, of sending them post free).
1840. The new "Palace of Westminster," as the Houses of Parliament are called, now begun.
1847. The Lords took possession of their new chamber.
1852. The Commoners met in their new chamber.
1858. First Jew admitted as M.P.
1867. Second Reform Bill passed.
1868. Voting by proxy in the House of Lords discontinued from this date, though under certain conditions it might be revived.
1872. Ballot Act passed, by which all voting at Parliamentary Elections has since been secret and by ballot.
1880. Members in certain cases allowed to affirm instead of taking an oath.
1882. The Closure (the power of closing a debate by a vote of the House) adopted.
1884. Third Reform Bill passed.
1901. Eleven Irish Nationalists forcibly removed by the Police.
1906. A new party formed of "Labour Members."

PARLIAMENTARY REFORM. This has been effected by three Reform Bills, each of which has lowered the franchise and redistributed the seats in Parliament, thus giving the franchise, or right of voting, to a larger number of people, and assigning a larger number of members to the more populous places.

First Reform Bill, 1832. The franchise was made uniform in all boroughs instead of depending, as formerly, on custom, which varied with the locality. Now, in all boroughs, the franchise was given to those who occupied premises worth £10 annually. In counties to all freeholders of land worth at least 40s. per annum, to the holders of leases for sixty years to the annual value of £10, and to all farmers and others who paid at least £50 a year as rent. It disfranchised fifty-six boroughs, each of which had less than 2000 inhabitants, and it took one member from each of thirty boroughs more that had less than 4000 inhabitants. This gave 143 seats for distribution among the more populous districts.

Second Reform Bill, 1867. The franchise in boroughs was given to householders occupying houses rated at £5 at least, and to lodgers paying £10 a year. In the counties the franchise was lowered to £12 annual rent. At the same time thirty-five seats were taken away, partly from corrupt boroughs, partly from the less populous, and given to London and other populous places.

Third Reform Bill, 1884–5. This bill extended to the counties the household and lodger suffrage conferred by the previous Reform Bill on the boroughs. All boroughs having less than 15,000 inhabitants were to cease as such, and to form part of the county in which situated; and those having less than 50,000 inhabitants were to lose one member if previously entitled to two. 160 seats obtained in this way were divided among counties and boroughs with a large population. The total number of members was also raised from 652 to 670.

SUMMONING OF PARLIAMENT. Parliament is summoned by the Sovereign, and its summoning or otherwise was once an absolute Royal Prerogative; but it is now to a certain extent regulated by Acts of Parliament and the necessities of public business. By the unrepealed sections of the Triennial Act, 1694, it is provided that "a parliament shall be holden once in three years at the least," so that after one parliament has come to an end, it is legally incumbent on the sovereign to summon another within three years. But owing to the fact that taxes are voted annually and that the Army Act which authorises the existence of the standing army has to be passed every year, it will be seen that it is now a practical impossibility for the government of the country to go on for more than a year without the assistance of parliament. Parliament is summoned by Royal Writ. The King with the advice of the Privy Council by proclamation (usually in the proclamation whereby a former Parliament is dissolved) directs the Lord Chancellors of Great Britain and Ireland to cause writs for a new parliament to be issued returnable within thirty-five days and addressed to the Spiritual and Temporal Peers, to the Judges of the High Court and the Law Officers of the Crown, and to the Returning Officers of the constituencies.

OPENING OF PARLIAMENT. On the day appointed in the Proclamation, Parliament assembles in the two Houses at Westminster. The Commons are called to the bar of the Upper House and directed to elect a Speaker. They then return to their own House and having elected their Speaker proceed to take the oath (see later under *House of Commons*). A day or two afterwards the King, accompanied by his Consort attends in state at the House of Lords, and Black Rod (see under *House of Lords*) is

sent to summon the Speaker and the Commons to the bar of the House of Lords. The King then reads his speech from the throne, a speech which in reality is drawn up by the cabinet, and which comprises a review of the international situation and a summary of the legislation intended to be introduced by the ministry during the session. Those parts of the King's Speech which refer exclusively to finance and taxation are addressed to the members of the House of Commons. If the sovereign is unable to attend in person, a Royal Commission opens parliament in his place and the speech is read by the Lord Chancellor.

The Commons on returning to their own House usually exercise their privilege of reading a Bill for the first time to demonstrate the fact that they are not bound to confine their attention exclusively to matters dealt with in the speech from the throne. The speech is subsequently read again in both Houses by the Lord Chancellor and the Speaker respectively, and an Address in reply, consisting practically in a repetition of the text of the speech itself, is moved and seconded in each house by two junior members of the party in power attired in uniform or court dress. The Opposition usually moves certain amendments to the Address and thus early in the session has an opportunity of attacking and criticising the policy of the Government. When the Address has been agreed to, it is duly presented to the sovereign.

DURATION OF PARLIAMENTS. By the Septennial Act, 1716, it was enacted that parliaments may continue for seven years and no longer from the day appointed by the writs for their assembling. But in practice this limit has never been reached. The King can dissolve parliament at any time, and he usually does so on the advice of the Prime Minister and the cabinet when the ministry find, either that they cannot command a majority in the Commons or that for party and electioneering reasons a dissolution is desirable.

There are three ways of suspending the sittings of Parliament—dissolution, prorogation, and adjournment:—

(1) *Dissolution.* The King dissolves parliament by means of a Proclamation under the Great Seal; and, as we have seen, the same proclamation usually provides for summoning the next parliament.

(2) *Prorogation.* This is a device, first adopted in the reign of Henry VIII. for prolonging the life of parliament from one session to another. Parliament is said to be prorogued when, by an act of the Crown its sittings are suspended either indefinitely or until a certain fixed day. This not only occurs at the end of a parliamentary session, but also as preliminary to a dissolution.

(3) *Adjournment.* This is a temporary suspension of parliamentary business for a certain time in the course of a session. It takes place in either House independently of the other and by an act of the House itself without the concurrence of the Crown. After an adjournment business goes on from the point at which it left off; but after a prorogation or dissolution, any Bill that has not passed through all its stages and received the royal assent must be reintroduced and treated as a new Bill.

PARLIAMENTARY ELECTIONS.

We shall state first of all who enjoy the franchise or the right to vote for a Member of Parliament; secondly, who may be a candidate for election; thirdly, how the election is to be conducted; fourthly, the method of voting; and, lastly, the modes of disputing the results of an election.

1. REGISTRATION OF VOTERS. No one may vote at any Parliamentary Election unless his name has been registered on the list of voters of the particular county or borough for which he is entitled to vote.

DISQUALIFICATIONS. Certain persons are absolutely disqualified from being registered. They include (1) Women. (2) Infants, i.e. persons under twenty-one years of age. (3) Aliens who have not become British subjects. (4) Convicted felons, until they have served their sentences or been pardoned. (5) Lunatics and idiots. (6) Peers of the realm. (7) Corporations. (8) Persons paid to do work at elections, e.g. election agents. (9) Persons convicted of "corrupt practices," for seven years after their conviction. (10) Persons convicted of "illegal practices," for five years after their conviction. (11) Persons in receipt of parochial relief, if they have received the relief within twelve months before the 15th July of the year of registration; but receipt of the benefits of the Vaccination Acts and certain other kinds of medical relief do not disqualify the recipient.

QUALIFICATIONS. If a person desires to have his name entered on the Register as a Parliamentary voter, not only must he have none of the above disqualifications but he must also be possessed of a Property, Occupation, Residential or Lodger's qualification.

(*a*) **Property Qualification.** In England, the property qualification, which applies only in the case of county constituencies, is one of the following:—

(1) The beneficial ownership of freehold heritable property of the clear yearly value of forty shillings. (2) The beneficial ownership of a life estate of the clear yearly value of £5. (3) The ownership in copyhold of an estate for life, or any greater estate of the clear yearly value of £5. (4) The ownership of leasehold property held originally for a term of sixty years or more, of the clear yearly value of £5. (5) The ownership of a leasehold of the clear yearly value of £50, held originally for a term of twenty years or more.
